In a pre-Gibbonian Early Modern Age a renaissance of Hellenic arts and letters had not been able to prevent an obstinately fanatical religious enthusiasm from beheading a King of England in A.D. 1649 or from defenestrating a Caesarean Majesty's envoys in A.D. 1618, or from celebrating Saint Bartholomew's Day, A.D. 1572, by a massacre of the adherents of one of two rival sects. In a pre-Modern 'Gothic Age'—into which Gibbon's historical vision ran together the Western 'Middle Ages' (*currebant* A.D. 1075–1475) and the Western 'Dark Ages' (*currebant* A.D. 675–1075) and a post-Hellenic social interregnum (*currebat* A.D. 375–675)—the human werewolf's inveterate crimes, follies, and misfortunes¹ had not even been relieved by a nascent gleam of intellectual and aesthetic light. That tale of eleven bestial centuries had been told off under the joint reign of Barbarism and Religion, whose triumph had been Gibbon's theme;² and, for two centuries after the official deposition of Barbarism by fifteenth-century Italian Hellenists, Religion had not only remained on the throne herself but had contrived to serve as a most effective deputy for her nominally dethroned colleague. Thus the history of the decline and fall of the Roman Empire—which Gibbon had pronounced to be 'the greatest, perhaps, and most awful scene in the history of Mankind'³—had been followed by no less than thirteen centuries, all told, in which History had persistently run true to her Gibbonian type; and then suddenly, rather less than a hundred years before the time at which Gibbon was writing, we are invited to believe that the noisome flow had inexplicably come to a halt and had left the historian and his contemporaries securely high and dry.

'God, I thank Thee that I am not as other men are.'⁴ Gibbon's implicit faith in the uniqueness of his own advantageously distinguished generation's destiny is a classic example of the egocentric illusion;⁵ and we are

⁵ See I. i. 159.

left wondering how an eighteenth-century philosopher who was a merciless critic of 'Gothic' credulity could ever have come to harbour so incredible a belief as this. The answer must be that a conventional Christian *Weltanschauung* in Bossuet's vein, which Gibbon had repudiated on the level of his consciousness, had taken its revenge upon him by disappearing underground in order to evolve a secularized caricature of itself out of the sump of an outraged Subconscious Psyche.

This irrational eighteenth-century complacency about the present state and future prospects of a latter-day Western Society was not easily disturbed, though History lost no time in retorting to Gibbon's pontifical sentence of expulsion by recurring as inconscionably as Nature herself.¹ Gibbon had fallen into the naïve observational error of mistaking for the Millennium a spell of low ideological temperature (*durabat circa* A.D. 1660–1792) between two paroxysms of savage fratricidal warfare, owing to the lucky accident that his *magnum opus* happened to have been on the stocks when this low temperature had been at its nadir. The twenty years² (*circa* 1768–87) during which he had been writing *The History of the Decline and Fall of the Roman Empire* had elapsed within the lull (*durabat* A.D. 1763–92) between the martial aftermath of one general war—the most temperate and undecisive contest of its kind in Modern Western history—and the onset of another general war into which the newly kindled fire of Democracy was to put an ominously fervent drive.³ Yet the experience of the General War of A.D. 1792–1815 and its aftermath did not save a latter-day Western bourgeoisie that was born into a subsequent lull (*durabat* A.D. 1871–1914) from hugging Gibbon's error; and, even after the great cataclysm of A.D. 1914–18, Gibbon's eulogy of a Modern Western international anarchy was re-edited in the form of an apologia by a distinguished English historian and public servant of the prediluvian generation, Sir James Headlam-Morley (*vivebat* A.D. 1863–1929)—as witness the following passage in an address delivered by him in April 1924.

'In our analysis of this [Western] culture the first great fact that we will notice is that, though undoubtedly there is a common history and common civilisation for all Western Europe, the people were not joined in any formal political union, nor has the country ever been subjected to one common government. For a moment, indeed, it looked as though Charlemagne would establish his authority over the whole area; that hope, as we know, was to be disappointed; his attempt to create a new empire failed, as all subsequent attempts have failed. Again and again attempts were made by the later Empire, by the rulers of Spain and France, to unite the whole of Western Europe in one great state or empire. Always we find the same thing: the appeal to local patriotism and personal liberty inspires a resistance which breaks down the efforts of every conqueror. And so there has been as a permanent characteristic of Europe that which critics call anarchy; for the absence of a common rule means struggle, fighting, and war, a ceaseless confusion between rival units of government [contending with one another] for territory and predominance.

¹ Horace: *Epistulae*, Book I, Ep. x, l. 24.

² See *The History of the Decline and Fall of the Roman Empire*, chap. lxxi, *ad finem*.

³ See IV. iv. 150–1.

'This is a condition which to many is very shocking. Undoubtedly it implies a great expenditure of energy, a great destruction of wealth, at times a great loss of life. There are many, in consequence, who would have preferred to see the gradual establishment of some common government and who, to its disadvantage, contrast the history of Europe with that of Imperial Rome, or—at the present day—of the United States of America. There are many, from the days of Dante onwards, who have longed for that ordered government which might appear to be the true reflex and instrument of Divine Providence. How often do we hear it said that if, on the soil of America, English and Italians and Poles and Ruthenians and Germans and Scandinavians can all live side by side in peace and contentment, why should they not do so in their original homes?

'I have not to-day to discuss ideals of the future; we are concerned with the past, and all that we have to do is to note the fact that this anarchy, this warfare, this rivalry, existed just at the time when the energies of the Continent were at their highest. Let us note also that the energies of the Mediterranean World—the vital force, artistic spirit, intellectual ingenuity—seem gradually but steadily to have decayed, and that the beginning of the decay coincided with the establishment of a common government.¹ May it not be that the friction and disorder was not in reality merely destruction of energy, but the cause by which the energy was produced?'²

It is strange to hear Gibbon's reassuring voice still echoing in an England that was now ringing with the dread sound of an apocalyptic trump. By A.D. 1924, however, the antithetical feeling, expressed in a different reading of the significance of an antecedent Hellenic Civilization's decline and fall, was already in the ascendant in a stricken Western World; and indeed Gibbon himself had lived to be overtaken by a revulsion of feeling about the prospects of the Western Civilization, though he did not live to make any corresponding revision of the text of his 'General Observations'.

At Lausanne, some two years after the night of the 27th June, 1787, on which he had written the closing words of the 'Decline and Fall' in his quiet garden in that peaceful Swiss city, an historian whose unsuspecting ear had failed to catch the undertones of a new ideological enthusiasm in the music of a temperate contest played in A.D. 1775-1783³ was suddenly shaken out of his complacency by the outbreak of the French Revolution, and he never recovered from the shock. He had flattered himself that a once rolling stream of Time had been frozen into a perpetual immobility, and now the rebellious waters had burst out again in an unprecedentedly boisterous flood. The horrifying cataclysm had swept away the sandy foundations of the hapless historian's confidence long before it became a menace to the independence and integrity of the Swiss Confederation, and the glimpse of Time's angry sea-horses tossing their white manes above the sky-line of the Jura was something more than Gibbon's nerves could stand. 'Altogether there was too much his-

¹ It will be noticed that Headlam-Morley here takes as marking the beginning of the disintegration of the Hellenic Civilization an event which, in this Study, has been taken as marking the second and most notable of the successive rallies by which the course of this disintegration was punctuated.—A.J.T.

² J. W. Headlam-Morley: 'The Cultural Unity of Western Europe', in *The New Past and other Essays on the Development of Civilization*, edited by E. H. Carter (Oxford 1925, Blackwell), pp. 88-89.

³ See IV. iv. 165-7.

tory going on for a historian to feel quite safe.¹ In May 1793 Gibbon fled from Lausanne for the insular asylum of which he was a native. Racing breathlessly round the wide arc described by the east bank of the Rhine while revolutionary French armies were battering the fortresses guarding the western approaches to the river, the historian-refugee managed to make his way to England via Holland; but his Muse had been silenced and his spirit broken; and he added nothing to his laurels before his death on the 16th January, 1794.

The verdict on an eighteenth-century Western Society's self-satisfaction was

'Woe unto you when all men shall speak well of you; for so did their fathers to the false prophets.'²

'I have said: Ye are gods, and all of you are children of the Most High; but ye shall die like men and fall like one of the princes.'³

Nemesis was the inevitable consequence of *hybris* in both Hellenic and Hebraic belief;⁴ and the nemesis which a Modern Western Society invited by succumbing to a Gibbonian *Weltanschauung* was the death that had overtaken so many other representatives of the species. Intimations of mortality from experiences of the French Revolution might have been expected to have been the last testament of an English man of letters who had lived to see the French Revolution break out two years after he had finished writing *The History of the Decline and Fall of the Roman Empire*; but Gibbon left the message to be delivered, sixty years after his death, by a French aristocrat of perverse yet, in some points, prescient genius, Count J. A. de Gobineau (*vivebat* A.D. 1816-82),⁵ who was born in the year following the close of the General War of A.D. 1792-1815, and who published his *Meisterwerk* late enough to include Western Industrialism as well as Western Democracy in his prophetic indictment, and to find the death's head that was to be his grand *pièce justificative* in the wreckage, not of Rome, but of Tiahuanaco.⁶

'Pour la vapeur et toutes les découvertes industrielles, je dirai aussi, comme de l'imprimerie, que ce sont de grands moyens; j'ajouterai que l'on a vu quelque fois des procédés nés de découvertes scientifiques se perpétuer à l'état de routine, quand le mouvement intellectuel qui les avait fait naître s'était arrêté pour toujours, et avait laissé perdre le secret théorique d'où ces procédés émanaient. Enfin, je rappellerai que le bien-être matériel n'a jamais été qu'une annexe extérieure de la civilisation, et qu'on n'a jamais entendu dire d'une société qu'elle avait vécu uniquement parce qu'elle connaissait les moyens d'aller vite et de se bien vêtir. . . .

'Nous croyons, nous, que notre civilisation ne périra jamais, parce que nous avons l'imprimerie, la vapeur, la poudre à canon. L'imprimerie, qui n'est pas moins connue au Tonquin, dans l'empire d'Annam et au Japon que dans l'Europe actuelle, a-t-elle, par hasard, donné aux peuples de ces contrées une civilisation même passable? . . .

² Luke vi. 26.

³ Ps. lxxxii. 6-7.

⁴ See IV. iv. 245-61.

⁵ The political background of de Gobineau's racial theory of History has been indicated in II. i. 216-17.

⁶ For Tiahuanaco, see the passage of a work by P. A. Means that has been quoted in the present Study in II. i. 322.

'Est-on bien en droit de . . . conclure, comme on le fait généralement avec trop de facilité, que notre civilisation ait la préexcellence sur toutes celles qui ont existé et existent en dehors d'elle? Oui et non. Oui, parce qu'elle doit à la prodigieuse diversité des éléments qui la composent, de reposer sur un esprit puissant de comparaison et d'analyse, qui lui rend plus facile l'appropriation de presque tout; oui, parce que cet éclectisme favorise ses développements dans les sens les plus divers; oui, encore, parce que, grâce aux conseils du génie germanique, trop utilitaire pour être destructeur [*sic* — A.J.T.], elle s'est fait une moralité dont les sages exigences étaient inconnues généralement jusqu'à elle. Mais, si l'on pousse cette idée de son mérite jusqu'à la déclarer supérieure absolument et sans réserve, je dis non, car précisément elle n'excelle en presque rien. . . .

"Toutes les civilisations qui nous ont précédés ont pensé, comme nous, s'être cramponnées au rocher du temps par leurs inoubliables découvertes. Toutes ont cru à leur immortalité. Les familles des Incas, dont les palanquins parcouraient avec rapidité ces admirables chaussées de cinq cents lieues de long qui unissent encore Cuzco à Quito, étaient convaincues certainement de l'éternité de leurs conquêtes. Les siècles, d'un coup d'aile, ont précipité leur empire, à côté de tant d'autres, dans le plus profond du néant."¹

In these passages de Gobineau draws from *les ruines*² a moral that gives the lie direct to Gibbon's. De Gobineau, was an erratic stumbling-block in a primly Philistine Victorian wilderness, and his maliciously paradoxical style of delivery was not well calculated to make these tart intimations of mortality carry far in the crassly non-conductive psychic medium of nineteenth-century Western bourgeois feelings. It required a more terrifying portent than the French Revolution, and a sharper stab than a disgruntled French aristocrat's gadfly sting, to produce an outright inversion of Western feelings about the Western Civilization's prospects. A French voice intoning a palinode to Gibbon's paean in Western ears that were at last attuned to receive this solemn warning was not to be heard before the morrow of the General War of A.D. 1914-18. The first effective counterblast to Gibbon's 'Observations' was an elegy from the pen of Paul Valéry that was first published in the spring of A.D. 1919 in an English translation.

'Nous autres, civilisations, nous savons maintenant que nous sommes mortelles.

'Nous avons entendu parler de mondes disparus tout entiers, d'empires coulés à pic avec tous leurs hommes et tous leurs engins; descendus au fond inexplorables des siècles avec leurs dieux et leurs lois, leurs académies et leurs sciences pures et appliquées, avec leurs grammaires, leurs dictionnaires, leurs classiques, leurs romantiques et leurs symbolistes, leurs critiques et les critiques de leurs critiques. Nous savions bien que toute la terre apparente est faite de cendre, que la cendre signifie quelque chose. Nous apercevions à travers l'épaisseur de l'histoire les fantômes d'immenses navires qui furent chargés de richesse et d'esprit. Nous ne pouvions pas les compter. Mais ces naufrages, après tout, n'étaient pas notre affaire. *Elam, Ninive, Babylone* étaient de beaux noms vagues, et la ruine totale de ces mondes avait aussi peu de signification pour nous que leur existence

¹ de Gobineau, le Comte J. A.: *Essai sur l'Inégalité des Races Humaines* (Paris 1853-57, Firmin-Didot, 4 vols.), vol. i, pp. 281, 276, 170, 281.

même. Mais *France, Angleterre, Russie* . . . ce seraient aussi de beaux noms. *Lusitania* aussi est un beau nom. Et nous voyons maintenant que l'abîme de l'histoire est assez grand pour tout le monde. Nous sentons qu'une civilisation a la même fragilité qu'une vie. Les circonstances qui enverraient les œuvres de Keats et celles de Baudelaire rejoindre les œuvres de Ménandre ne sont plus du tout inconcevables; elles sont dans les journaux.¹

In chastened Western eyes, from which the scales had now fallen, the first vision of Reality was a recognition of the Western Civilization's mortality;² but the tardy dawning of enlightenment through suffering did not stop here; and the second vision was a conviction of sin which was a still more shattering spiritual experience than the recognition of mortality.

'Ce n'est pas tout. La brûlante leçon est plus complète encore. Il n'a pas suffi à notre génération d'apprendre par sa propre expérience comment les plus belles choses et les plus antiques et les plus formidables et les mieux ordonnées sont périssables *par accident*; elle a vu, dans l'ordre de la pensée, du sens commun et du sentiment, se produire des phéno-

¹ Valéry, Paul: 'La Crise de l'Esprit', in *Variété* (Paris 1924, Gallimard, Éditions de la Nouvelle Revue Française), pp. 11-12. The two letters composing this essay were written 'for translation into English' and were first published in the London Journal *The Athenaeum* on the 11th April and the 22nd May, 1919 (No. 4641, pp. 182-4; No. 4644, pp. 279-80).

² The present writer received his first intimation of the mortality of the Western Civilization in an experience (mentioned in this Study already in IV. iv. 282) at the south-eastern corner of the Island of Crete, *en route* from Khandrà to Palafkastro, on the 19th March, 1912. Rounding the southern shoulder of a mountain, he was startled at suddenly finding himself face to face with the ruins of a country house in the Baroque style of architecture. If the date of this experience had been A.D. 1952 instead of being A.D. 1912, probably he would not have felt the same shock; for by A.D. 1952 a deserted and dilapidated seventeenth-century country house was no longer an unimaginable object in the landscape of the writer's native province of the Western World; but in A.D. 1912 every house of the kind in England would have been intact and have been inhabited—as likely as not, by descendants of the country squire who had had the house built for him some two or three hundred years back in the past. What was startling and disturbing for a Western observer in A.D. 1912 was to see a piece of architecture which, in his mental picture of his native country, was associated with the living world of his own generation standing here in Crete as starkly dead and deserted as the monuments of an Hellenic architecture at Gortyna and Praesus, and the monuments of a Minoan architecture at Cnossos and Phaestus, that he had been inspecting within the last few days in the course of his journey. This inevitable comparison awakened his imagination to the truth that, on this island, a civilization which was his own, and which on his own island was then still self-confidently alive, was already as dead as the civilizations that had come and gone in earlier generations of this species of society.

Gazing at what, at that date, was so portentous a spectacle for Western eyes, the English traveller realized that this house must have been built, on the eve of the Great Veneto-Ottoman War of Candia (*gerebatur* A.D. 1645-69), by some Venetian country gentleman or official, and that this seventeenth-century Venetian builder must have taken it just as much for granted as his English contemporaries, who were then building other houses in the same style on another island, that his new family mansion would continue to be occupied by his descendants for many generations to come. The Englishman then reflected that a Venetian rule in Crete that had been extinguished by Ottoman arms in A.D. 1669 had by that date been in existence for no less than 457 years—a span of time which, in A.D. 1912, was longer than that of the duration, up to date, of British rule in the oldest of the overseas possessions of the British Crown. The inference was inescapable. If the Venetian Empire had perished, the British Empire could not be immortal; and, if the Western Civilization, in which Great Britain as well as Venice lived and moved and had her being, had become extinct in a former Cretan province of its domain, there could be no province, on any shore of either the Mediterranean or the Atlantic, in which a Westerner would be justified in assuming that his civilization was invested with the incredible privilege of being exempt from the jurisdiction of Death the Leveller.

mènes extraordinaires, des réalisations brusques de paradoxes, des déceptions brutales de l'évidence.

'Je ne citerai qu'un exemple: les grandes vertus des peuples allemands ont engendré plus de maux que l'oisiveté jamais n'a créé de vices. Nous avons vu, de nos yeux vu, le travail consciencieux, l'instruction la plus solide, la discipline et l'application les plus sérieuses, adaptés à d'épouvantables desseins.

'Tant d'horreurs n'auraient pas été possibles sans tant de vertus. Il a fallu, sans doute, beaucoup de science pour tuer tant d'hommes, dissiper tant de biens, anéantir tant de villes en si peu de temps; mais il a fallu non moins de *qualités morales*. Savoir et Devoir, vous êtes donc suspects?'¹

This keen-eyed castaway, peering down into the depths of Western Man's Subconscious Psyche from a revealing observation-post on the flotsam from a spiritual shipwreck, had anticipated the experience that Thor Heyerdahl and his comrades were to have when they peered down into the depths of the Pacific Ocean between the logs of their balsawood raft. This perilously intimate commerce with elemental Nature brought into view deep-sea monsters that had been invisible to the comfortable passengers on board a mechanically propelled Modern Western luxury liner;² and Valéry had the imagination to realize that there must be yet more horrifying depths below the depths so far surveyed by eyes receiving only a first lesson in enlightenment through suffering. The inhabitants of London needed the harsher ordeal of a Second World War to transfigure their mood from the hysterical *abandon* of Armistice Day, 1918, to the sober restraint of VE Day, 1945. An observer who, on both days, was out and about in the streets of London, in the neighbourhood of Buckingham Palace and Whitehall, could hardly fail to be struck by the contrast between the temper of a crowd who had jumped to the childish conclusion that they had seen the last of War in their time, and perhaps for all time, and the temper of the same crowd when another twenty-seven years of disillusioning experience had taught them to suspect that, in their time, world wars were not just meaninglessly hideous accidents in a normally rational and benign order of Nature, but were the very stuff of which the thread of contemporary world history was being spun. This lesson, which the Londoners were taking to heart in A.D. 1945, had been learnt by the French man of letters twenty-seven years earlier. At the moment of the sounding of the first cease-fire, Paul Valéry had been aware that he was witnessing the end of an act which was not the end of the tragedy—as he testifies in the following exordium of an address delivered by him at Zürich on the 15th November, 1922.

'L'orage vient de finir, et cependant nous sommes inquiets, anxieux, comme si l'orage allait éclater.

'Presque toutes les choses humaines demeurent dans une terrible incertitude. Nous considérons ce qui a disparu, nous sommes presque détruits par ce qui est détruit; nous ne savons pas ce qui va naître, et nous pouvons raisonnablement le craindre. Nous espérons vaguement, nous redoutons précisément; nos craintes sont infiniment plus précises que nos espérances;

¹ Valéry, *op. cit.*, pp. 12-13.

² See Heyerdahl, Thor: *Kon-Tiki, Across the Pacific by Raft* (Chicago 1950, Rand McNally), p. 117, quoted on pp. 398-9, above.

nous confessons que la douceur de vivre est derrière nous, que l'abondance est derrière nous, mais le désarroi et le doute sont en nous et avec nous. Il n'y a pas de tête pensante, si sagace, si instruite qu'on la suppose, qui puisse se flatter de dominer ce malaise, d'échapper à cette impression de ténèbres, de mesurer la durée probable de cette période de troubles dans les échanges vitaux de l'humanité.

'Nous sommes une génération très infortunée à laquelle est échu de voir coïncider le moment de son passage dans la vie avec l'arrivée de ces grands et effrayants événements dont la résonance emplira toute notre vie.'¹

In truth, the entr'acte during which these words of foreboding were written was to be followed by a second act of a post-Modern Western tragedy in which German virtues were to be the agents of far worse German wickedness than the worst that had come into action in the years A.D. 1914-18. The atrocities committed in hot blood by the armies of the Second Reich on the war-path through an invaded Belgium whose neutrality Germany had pledged herself to respect were to be eclipsed by the enormity of the cold-blooded atrocities that were to be perpetrated by Nazi gangsters on a home front, while the moral shock to Western feelings was to be in inverse ratio to the ghastliness of the crimes. Western consciences which in A.D. 1914 had still been tender enough to be startled and outraged had become too numb, twenty and thirty years later, for horror to keep pace with familiarity. Yet, where *saeva indignatio*² fell out of the race, intellectual integrity could still keep in the running, and this virginal virtue of the Human Spirit testified that, in bringing in a well-deserved verdict of 'guilty' against German prisoners at the bar of Divine Justice, the rest of the Western World was proclaiming its own guilt in the same breath; for, when a non-German majority of a Western community had done its best to clear itself of complicity in German crimes by making the most of the German people's peculiar aberrations from the main path of the Western Civilization's moral and political progress in the Modern Age, these non-German Westerners could not deny, in the last resort, that those horrifyingly aberrant Germans were still bone of their bones and flesh of their flesh.³ A Western nation which, for good or evil, had played so central a part in Western history, since the first emergence of a nascent Western Civilization out of a post-Hellenic interregnum, could hardly have committed these flagrant crimes if the same criminality had not been festering foully below the surface of life in the Western World's non-German provinces. The twentieth-century German psyche was like one of those convex mirrors in which a gazer learns to read the character printed on his own countenance through seeing the salient features exaggerated in a revealing caricature. If a twentieth-century Germany was a monster, then, by the same token, a twentieth-century Western Civilization was

¹ Valéry, Paul: Extrait d'une conférence donnée à l'université de Zurich le 15 Novembre 1922, reprinted in *Variété*, pp. 33-34. See also Bridges, Robert: *The Testament of Beauty*, Book II, ll. 954 to the end, especially the last ten lines, recording the poet's feelings, charged with 'a profounder fear', 'amid the flimsy joy of the uproarious city'.

² 'Ubi saeva indignatio ulterius cor lacerare nequit' (Dean Swift's anticipatory epitaph on himself).

³ Gen. ii. 23.

a Frankenstein guilty of having been the author of this German monster's being. There, in this monstrous exhibition of a Germany running amok, went France, England, and America likewise, but for the Grace of God—and not one of them could be sure of being saved when their sister Germany had been lost.

Thus already in A.D. 1922, and *a fortiori* in A.D. 1952, when the paroxysm by which the West had been seized in A.D. 1914 was another thirty years older, it was manifest that the West's direst malady was Sin and not Mortality.

'On peut dire que toutes les choses essentielles de ce monde ont été affectées par la guerre. . . . L'usure a dévoré quelque chose de plus profond que les parties renouvelables de l'être. Vous savez quel trouble est celui de l'économie générale, celui de la politique des États, celui de la vie même des individus: la gêne, l'hésitation, l'appréhension universelles. *Mais parmi toutes ces choses blessées est l'esprit.* L'Esprit est en vérité cruellement atteint; il se plaint dans le cœur des hommes de l'esprit et se juge tristement. Il doute profondément de soi-même.¹ . . . L'oscillation du navire a été si forte que les lampes les mieux suspendues se sont à la fin renversées.²

'Ainsi la Persépolis spirituelle n'est pas moins ravagée que la Suse matérielle. Tout ne s'est pas perdu, mais tout s'est senti périr.'³

This note of interrogation, on which a French man of letters concluded an inquiry into the prospects of the Western Civilization on the morrow of the first of the general wars that a Westernizing World inflicted on itself in its post-Modern Age, was presented in a challenging visual form by a contemporary English caricaturist whose sardonic pictorial treatment of the same theme was not less effective than Paul Valéry's elegiac prose in bringing out an inherent tragedy.

In a serial triptych exhibited in London early in the inter-war period A.D. 1919-39, Max Beerbohm depicted, in his inimitable style, his notion of the Eighteenth, Nineteenth, and Twentieth Centuries' divers conceptions of their approaching successors.

In the first cartoon in the series, the Eighteenth Century, in the guise of a faultlessly frizzed and powdered man of the world, is looking down quizzically at the Nineteenth Century in the guise of a raw young man who is unable to hide his embarrassment under his disdainful senior's disgusted scrutiny. According to the Eighteenth Century's Gibbonian philosophy, History ought, of course, to have culminated in this Golden Age's unsurpassable self. The very suggestion that this definitive century might have a successor is a most offensive imputation upon its claim to have found and quaffed the elixir of immortality; and the present young pretender to a no longer open succession has added insult to injury by presenting himself as a figure of fun whose uncouthness is not a good joke when judged by eighteenth-century standards of good taste.

In terms of Sinic imagery with which we have made ourselves familiar in this Study, the Eighteenth Century is striking in this first cartoon the wry attitude of a complacently established Yin-state towards a diffidently

¹ Valéry, Paul: lecture of the 15th November, 1922, in *Variété*, p. 34.

² Valéry, Paul: 'La Crise de l'Esprit', in *Variété*, p. 16.

³ *Ibid.*, p. 13.

approaching Yang-activity. In the second cartoon the Nineteenth Century—here portrayed as a portly business man in Victorian dress whose rotundity and rubicundity give the measure of his prosperity—is shown beaming with a fatuous confidence as he pats on the back a still more rotund and rubicund reproduction of himself, attired in the self-same Victorian trousers, frock coat, and top hat; and in this mid-way tableau of the three a Sinic eye would no doubt see a picture of the Yang-activity no longer diffident and apologetic but flushed with an exhilarating sense of boundless achievement. The crack-brained inventor of a chimaerical steam-engine has justified his hopes, beyond his own wildest dreams, by getting up a hitherto unimaginably powerful head of steam. He has exploded a wizened Eighteenth Century's illusion of an already attained static perfection in order to substitute for this a dynamic ideal of perfectibility to be approached through a perhaps endless number of bigger and better editions of the sanguine Nineteenth Century itself.

In the third of the three cartoons, by contrast with the other two, there is only one figure on the stage on which the tragedy of Western history is being played out; and this solitary actor is an emaciated young man in a twentieth-century suit of clothes and with one arm in a sling. His clothes are of so dark a hue that you would take him to be in mourning, and the sombreness of his dress is matched by the obscurity of the prospect ahead of him. He is facing a curtain of night whose blackness is relieved only by the pale glimmer of an enormous question-mark; and this symbol of uncertainty, on which the wistful young man's apprehensive eyes are riveted, occupies the place where the spectator's eye looks to find the missing second living performer.

What is the question that is tormenting this tragic Twentieth Century that has just come through the shattering experience of being blown up in early manhood by a terrific explosion of the Nineteenth Century's recklessly over-heated boilers? Is he saying to himself that he, for his part, cannot even profess to have any notion of what a Twenty-First Century is going to be like? Or is he, perhaps, wondering whether he can even look forward to having any successor of any kind? A prospect which a Gibbonian Eighteenth Century has taken as an insufferable insult would be taken by a Valérian Twentieth Century as a comforting assurance; but, in venturing to consider this reassuring possibility, is not he (the unhappy questioner asks himself) indulging in a vice of 'wishful thinking' which has come to be rated a mortal sin in a disillusioned century's recension of the Decalogue? Is it not far more probable that a second and a third explosion will have blown the coffinship *Hesperus* and all her crew to pieces long before the arrival of New Year's Day, A.D. 2001, can give the signal for the next change of the watch?

In these two identical portrayals of a Western World's outlook on the morrow of the War of A.D. 1914-18, Max Beerbohm and Paul Valéry are giving as faithfully accurate a picture of the same world's outlook on the morrow of the War of A.D. 1939-45 as if the draughtsman had reined in his pencil, and the writer his pen, till he had lived through a second

world war in one lifetime and had survived to witness the making and dropping of an atomic bomb.

If, however, we find this consensus between Valéry and Beerbohm impressive, what are we to make of it when Valéry and Gibbon, so far from speaking with one voice, declaim to us in irreconcilably discordant accents? When prophets disagree, are we to give credit to either of their opposing voices? The common-sense answer is that prophets talk the language of feeling, and that neither of the two antithetical attitudes which a Gibbon and a Valéry respectively represent is warranted by the facts. Gibbon's belief that, in his generation, the Western World had extricated itself, once for all, from the flow of History was decisively refuted, as we have seen, by revolutionary events that Gibbon himself lived to witness; but Gibbon's signal discomfiture is no evidence that an opposite appraisal of the Western Civilization's prospects is bound to prove correct. The symbol which a stricken Twentieth Century sees glimmering through the darkness ahead is not a skull-and-crossbones; it is a question-mark; and, though this cautionary signal will rightly give pause to a wayfarer who has been allowing himself to expect the light ahead of him to show green, the colour of the light that he is actually being shown is neither this beckoning green nor a forbidding red, but is a cryptically neutral yellow. Signs and portents which are good evidence that the wayfarer is in danger are no evidence at all that he is doomed to come to grief.

The truth is that Valéry's pessimism and Gibbon's optimism are, both alike, rationalizations of feelings that are irrationally subjective.

The only rational ground for Gibbon's complacent outlook was the ephemeral experience—out of date within Gibbon's own lifetime—of an exceptional spell of peace in the course of an exceptionally temperate passage of Modern Western history; but, if we were to try to account for Gibbon's complacency by seeing in it a rational inference from experience, we should hardly have begun to explain it. The deeper explanation of Gibbon's mood is to be found, not in any process of reasoning, but in an irrational egocentric illusion; and this most fantastic of all freaks of Maya is of course no peculiar aberration of one eighteenth-century Western philosopher's mentality.

The egocentric illusion has always beset every living organism in which an ego has ever asserted itself. In an earlier context we have made a survey of the breakdowns which human creatures, institutions, techniques, and ideals have brought upon themselves by the sin of self-idolization;¹ and we have observed² that there has never been a human personality, community, or society that has not been tempted to commit the fatuous impiety of trying to put itself in the place of its Creator by casting itself for the role of being 'the Chosen People' and 'the Heir of the World'.³ The most damning characteristic of this Original Sin of Human Nature is its aptness to vary in the degree of its virulence in inverse ratio to the measure of any rational justification for succumbing to it. Self-idolization is most flagrantly in evidence, not as a self-

¹ See IV. iv. 261-465.

² See IV. iv. 245-61.

³ Rom. iv. 13.

adjudicated reward for success, but as a self-exculpating compensation for failure. For example, in encounters between divers civilizations, the party that is the more apt to fall into the self-hypnotization of Narcissus is the assaulted party, not the assailant. This mirage is the inspiration of a Zealotism¹ that is an assaulted party's negative reaction; and the same baneful vice of self-worship manifests itself in Tithonian universal states,² in petrified civilizations,³ in the fossils of extinct civilizations,⁴ in arrested civilizations,⁵ and in primitive societies in their Yin-state.⁶

Such extreme manifestations of egocentricity are so many attempts to find escape in an inner asylum from an external reality with which the ego has failed to cope; and the most extreme manifestation of all is a Racialism which dreams of securing an automatic and inalienable salvation through the imaginary spiritual virtue of some particular physical make-up.⁷ We can still say 'We have Abraham'—or Arminius—to our father⁸ when we have no other word of hope or justification left; and this plea is, in fact, the last resort of spiritual bankrupts. Here, in self-esteem's last ditch, Zionists and National-Socialists meet; and here a de Gobineau rubs shoulders with a Gibbon; for the same ubiquitous egocentric illusion is the common ground for the pessimism of a nineteenth-century French aristocrat who despairs of a Western Civilization that has bred out or killed out his own incomparable Nordic Race, and for the optimism of an eighteenth-century English man of letters who believes in the prospects of a Western Civilization that has culminated in his day in his own incomparably polite society. An illusion that captivates such incongruously mixed company must spring from an Original Sin common to all Human Nature, and not from any common element in the allegedly objective facts on which the rival claimants to a unique pre-eminence have sought to base their mutually incompatible pretensions.

Another indication that Gibbon's optimism about the prospects of the Western Civilization was not grounded in any rational appreciation of contemporary Western experience is the significant fact that the same experience has moved other Western participants in it to view the Western World, not as a Paradise Regained which must be, and can be, preserved, but as a City of Destruction from which a faithful remnant must flee before this Gomorrah's jerry-built towers fall about a blindly unrepentant majority's ears. The same landscape may take on irreconcilably different aspects from diametrically opposite standpoints. Where top-dog sees a heaven, under-dog will see a hell; and, in fact, while 'the best of all possible worlds' was being commended to a comfortably placed religious, political, social, and intellectual 'ascendancy' by a Leibnitz and a Gibbon, the Early Modern, Late Modern, and post-Modern chapters of Western history were seeing the same world being denounced, repudiated, and deserted in equal good faith by a long series of

⁸ Matt. iii. 9.

ardent secessionists. The Protestants revolted against a Roman Catholic Church which, in their eyes, had ceased to be *Una Sancta* to become the Scarlet Woman of the Apocalypse.¹ The English shook from their feet the dust² of a treacherous continent, and the Americans the dust of a treacherous hemisphere. And, when a Western internal proletariat had become as widespread as the 'capitalist' Western Civilization that, in the Communists' indictment of it, stood accused of having reduced the proletariat to misery, the seceding Communists found in Russia a non-Western base of operations for mounting an attack upon Capitalism in its Western birthplace and citadel. The irreconcilability of these conflicting appreciations of a Western Civilization's value showed that all of them were subjective, and their subjectivity convicted all of them of inconclusiveness.

Pessimism, of course, was no more proof than optimism against the possibility of being refuted by events. If Gibbon lived to see the outbreak of the French Revolution refute his unfounded optimistic conviction that History had come to an end in the eighteenth century, he was only suffering the same fate as his forebears the eleventh-century Western Millenarians,³ whose no better founded pessimistic conviction that History was coming to an end on the thousandth anniversary of Christ's nativity—or, failing that, at any rate on the thousandth anniversary of the end of His mission on Earth—was no less conclusively refuted within their own lifetime by History's inconsiderate performance of sailing on serenely through each, in turn, of these nicely calculated successive terminal dates.

Nor did History merely insist on continuing to flow beyond the latest term that these Millenarians had prescribed for her. She completed their discomfiture by choosing the very date on which they had predicted that she was to go out of action as her date for opening a new chapter in the growth-phase of these eccentric Millenarian pessimists' own society. An eleventh century of the Christian Era which, in the event, did not bring with it the end of the history of all things, did doubly falsify the Millenarians' gloomy expectations by inaugurating, instead, the opening of a new chapter in the growth of the Western Civilization; and the fresh impetus acquired by this growing civilization in this critical passage of its history was actually comparable, in its vigour and creativity, to the classic flowering of the same civilization some four hundred years later. If it is a commonplace that the fifteenth century of the Christian Era saw the Western World move out of a 'medieval' into a 'modern' stage of its growth, it is no less clear that the eleventh century of Western history witnessed a similar transition to 'the Middle Ages' from 'the Dark Ages'.⁴ Yet, in thus conclusively demonstrating the erroneousness of the eleventh-century Western Millenarians' application to their own times of a Primitive Christianity's belief in the imminence of Christ's Second Coming, the course of Western history did not eradicate this traditional expectation from the minds of the confuted Millenarians' descendants. In cultivated Western

¹ Rev. xvii. 3-6.

⁴ See I. i. 171.

minds this belief did not fade out before the seventeenth century; in 'fundamentalist' Western Christian minds it was still alive in the present writer's lifetime.

The pessimist's error of mistaking dawn for nightfall may be rarer than the optimist's error of mistaking sunset for noon; yet the eleventh-century Western Christian Millenarians' misapprehension of the character of the age through which they were living has at least one striking counterpart in the Boeotian poet Hesiod's misapprehension of the prospects of his own Hellenic Civilization in the eighth century B.C. Hesiod believed that the Iron Age into which it had been his fate to be born was a worse age than all previous ages¹ of human history. In his eyes it was an age that was to see Honour and Justice, the slowest of the Gods to despair of Human Nature, at last break off their losing battle against triumphantly aggressive forces of evil and sorrowfully withdraw from the terrestrial arena, leaving human sinners and sufferers to their self-inflicted fate. The iron had entered into this eighth-century Hellenic prophet's soul.²

'O would that I had not tarried to live thereafter with the fifth race, but had either died before or had been born after; for now in these latter days is the Race of Iron. Never by day shall they rest from travail and sorrow, and never by night from the hand of the spoiler; and cruel are the cares which the Gods shall give them. The father shall not be of one mind with the children nor the children with the father, nor the guest with the host that receives him, nor friend with friend, nor shall brother cleave to brother as aforetime. Parents shall swiftly age and swiftly be dishonoured, and they shall reproach their children and chide them with cruel words. Wretches that know not the visitation of the Gods! Such as these would not repay their aging parents for their nurture. The righteous man or the good man or he that keeps his oath shall not find favour, but they shall honour rather the doer of wrong and the proud man insolent. Right shall rest in might of hand and Ruth shall be no more. The wicked shall do hurt to his better by use of crooked words with oath to crown them. All the sons of sorrowful Man shall have Strife for their helpmate—harsh-voiced Strife of hateful countenance, rejoicing in evil.

'And then, at long last, shall those spirits go their way to Olympus from the wide-wayed Earth, with their beautiful faces veiled in white raiment, seeking the company of the immortals, and leaving behind them the company of men—even the spirits of Ruth and Retribution. Pain and grief are the portion that shall be left for mortal men, and there shall be no defence against the evil day.'³

The sincerity of Hesiod's cry of anguish is transparent; yet it is manifest in retrospect that Hesiod in the eighth century B.C. was misreading the signs of the times as egregiously as the Millenarians were to misread them in the eleventh century of the Christian Era. Hesiod's announcement of the withdrawal of Astraea was just as wide of the mark as the Millenarians' announcement of the approach of the Last Judgement;

¹ The diffraction of a post-Minoan heroic age in Hesiod's retrospective vision of it through two different lenses has been noticed in VIII. viii. 74-78.

² 'Ferrum pertransiit animam eius', Psalm cv. 18, as mistranslated in the Vulgate version (where it is numbered civ. 18).

³ Hesiod: *Works and Days*, ll. 174-201.

for 'the Dark Night of the Soul' is a darkness that is the herald, not of Death, but of Dawn.

Thus feelings prove to be as inconclusive as statistics when we interrogate them as witnesses in an inquiry into the prospects of the Western Civilization; and, now that we have drawn blank in these two preliminary reconnaissances, it is time to have recourse to our well-tried empirical method of investigation.

C. THE TESTIMONY OF THE HISTORIES OF THE CIVILIZATIONS

(I) WESTERN EXPERIENCES WITH NON-WESTERN PRECEDENTS

IN earlier Parts of this Study we have tried to gain some insight into the causes of the breakdowns of civilizations and into the process of their disintegrations by making empirical surveys of relevant historical facts,¹ and in these surveys we have taken a synoptic view of evidence from the histories of all the civilizations known to us, including the Western. At the point which we have now reached in our present inquiry into the prospects of the Western Civilization mid-way through the twentieth century of the Christian Era, it may be useful to recall and review any conspicuous counterparts in Western history of phenomena in the histories of other civilizations which, in those histories, are recognizable symptoms of breakdown and disintegration.

In studying the breakdowns of civilizations, we found that the cause was, in every case, some failure of self-determination, and that, when human beings thus lost control over their own destinies, this social disaster usually turned out to have been the consequence of a moral aberration. A broken-down society, community, or individual would prove to have forfeited a salutary freedom of choice through having fallen into bondage to some idol of its own making. Mid-way through the twentieth century of the Christian Era the Western Society was manifestly given over to the worship of a number of idols that had been the bane of other civilizations in the past; but, among these, one stood out above all the rest, and this was the cult of the institution of Parochial Sovereignty embodied in parochial states that were being worshipped by their respective subjects as very gods² and that were demonstrating their demonic power over their devotees by exacting from them human sacrifices of ever greater enormity in cycles of fratricidal wars of a violence that was increasing in a geometrical progression.

This grimly prominent feature of post-Modern Western life was a terrifying portent on two accounts: first because this idolization of

¹ See IV. iv. 7-584; V. v. 15-568; and V. vi. 1-326.

² At some date during the latter part of the breathing-space between the general wars of A.D. 1914-18 and A.D. 1939-45, the writer of this Study heard the presiding officer of one of the livery companies of the City of London bear testimony which was convincing, because it was unselfconscious, to the primacy, in his *Weltanschauung*, of one of these tribe-worships. The occasion was a dinner at which the company was entertaining the delegates to an international congress that was in session in London at the time, and the presiding officer had risen to propose the toast 'Church and King'. Having it on his mind that a majority of his guests were foreigners who would not be familiar with an English tribal custom, the president prefaced the toast with an apology and an explanation. No doubt, he said, the order in which he had rehearsed the two institutions that were to be honoured conjointly in the toast that he was about to propose might seem to a foreigner not only quaint but perhaps even positively unseemly. He apologized for abiding, nevertheless, by the traditional order, and explained that he did so because it was the pride of the city companies to be meticulous in preserving antique usages, even when these had become so anachronistic as to be open to misconstruction by the uninitiated.

belligerent parochial sovereign states was the true, though unavowed, religion of a great majority of the inhabitants of the Westernizing World of the day¹ and, secondly, because this false and maleficent religion had been the death of no less than fourteen civilizations for certain, and perhaps of no less than sixteen, out of the twenty-one civilizations that had come into existence during the currency of this species of Society up to date.

Fratricidal warfare of ever increasing violence between parochial sovereign states had been by far the commonest cause of mortality among civilizations of all three generations.² In the first generation it had certainly been the destruction of the Sumeric³ and the Andean⁴ Civilization, and probably the destruction of the Minoan⁵ as well. In the second generation it had destroyed the Babylonian,⁶ the Indic,⁷ the Syriac,⁸ the Hellenic,⁹ the Sinic,¹⁰ the Mexic,¹¹ and the Yucatec.¹² In the third generation it had destroyed the Orthodox Christian Civilization, both in its main body¹³ and in its Russian offshoot;¹⁴ the Far Eastern Civilization in its Japanese offshoot;¹⁵ the Hindu¹⁶ and the Iranic.¹⁷ Of the five remaining known representatives of the species of Society to which the Western Civilization belonged, we may suspect that the Hittite Civilization likewise had brought itself to ruin by fratricidal warfare at home before it had run full tilt against a petrified Egyptiac World and had subsequently succumbed to a barbarian Völkerwanderung;¹⁸ and there were only four foundered civilizations whose evil genius had probably or certainly been an idol of a different clay. The evidence about the breakdown and disintegration of the Mayan Civilization that had been yielded by archaeological exploration so far was negative in the sense that it showed hardly a trace of any ravages of fratricidal warfare;¹⁹ the more abundant evidence about the breakdowns of the Egyptiac Civilization and the Far Eastern Civilization in China indicated that the idol to which these had sacrificed their lives had been, not Parochial Sovereignty asserting itself in fratricidal warfare, but an oecumenical polity—'the Old Kingdom' in the one case²⁰ and in the other case the Sui and T'ang evocation of a ghost of the Han Empire²¹—which had brought with it the additional incubus of a more and more top-heavy and parasitic bureaucracy. The incubus of a parasitic Nomad institution *in partibus agricolarum*—the slave-ascendancy of the Egyptian Mamlûks²²—may have been the death of the Arabic Civilization,²³ unless the fate of this society was a solitary instance of assassination by the hand of an alien assailant.²⁴

An idol whose cult had thus proved fatal to fourteen or sixteen out of twenty-one representatives of the species of Society to which the Western Civilization belonged manifestly could not be worshipped by its latter-day Western devotees with impunity. This form of collective self-wor-

ship had, in fact, already been the death of a Western city-state cosmos which had disengaged itself from, and forged ahead of, the rest of the Western World in the Medieval Age of Western history.¹ In the unhappy experience of this abortive sub-society within a Western Christian body social, the Venetians' idolization of their own dead collective self from the fifteenth to the nineteenth century of the Christian Era² had, as we have seen, been a startlingly close counterpart of the Athenians' idolization of their dead collective self from the fourth century B.C. onwards;³ and such examples from the history of the disintegration of a Western sub-society were not the only cases of this spiritual malady in the history of the Western World. While the Epimethean stance of Eire⁴ might perhaps be discounted on the ground that this was a defensive reaction of a submerged relic of an originally alien Far Western Christian Civilization which was showing in this way its recalcitrance to the Western Civilization's attempt to assimilate it, the reaction of the Virginians and the South Carolinians to their defeat in the Civil War of A.D. 1861-5 in the United States⁵ was an indubitable post-Modern Western instance of the Venetian-Athenian attitude; and, while this backward-turned posture was peculiarly incongruous with the forward-looking outlook normally characteristic of pioneers on new ground, the post-Bellum Epimetheanism of 'the Old South' of the United States was not so significant a portent for the prospects of the Western World as a whole as the Epimetheanism that had become rife in France after the General War of A.D. 1914-18 and, to a still greater degree, after the General War of A.D. 1939-45.

Moreover, in the Western World as a whole in the post-Modern chapter of its history, the devastating effects of the idolization of parochial sovereign states had been enhanced by the importation of a demonic 'drive' into the suicidal performances of these tribal gods' votaries. The restraining influence of an oecumenicalism on the ecclesiastical plane which the Western Civilization had inherited from its chrysalis the Western Christian Church had been removed by a lamentable victory of parochialism over oecumenicalism in Western life on this ecclesiastical plane at the transition to the Modern Age from the Middle Ages.⁶ The capacity of the parochial sovereign states of a Modern Western World to ruin their common civilization by ruining one another had been enhanced by the importation into their statecraft of an Italian efficiency which had been the unfortunate legacy of a foundering Medieval Western city-state cosmos.⁷ The impact of Nationalism upon the historic political map of a Late Modern Western World had imported a new ferocity into the fratricidal wars between Western parochial states by most inexpediently raising the stakes.⁸ In the paroxysm of wars fought in the name of Nationalism coupled with some form of political ideology which had begun with the outbreak of the American Revolutionary War in A.D. 1775, the contests could no longer be kept 'temperate and undecisive' because the parochial states of the Western World were now fighting one another

⁵ See IV. iv. 280-91.

⁸ See IV. iv. 185-90.

—as the Sinic parochial states had fought one another in the second and final paroxysm of a Sinic Time of Troubles—for their very existence, and no longer just for an inclination of the Balance of Power that would be too slight to menace the warring society's 'general state of happiness'.¹ The most serious of all these aggravations of an evil which was, at the best, a galloping consumption was, however, the impact of two recently begotten Western demons, Democracy and Industrialism, upon both Parochial Sovereignty² and an inter-state warfare³ that could never be abolished so long as Parochial Sovereignty was permitted to survive.

An Industrial Revolution that had overtaken the Western World in the eighteenth century of the Christian Era was an unmistakable counterpart of the economic revolution that had overtaken the Hellenic World in the sixth century B.C.;⁴ and this likeness was ominous inasmuch as the effect of either of these revolutions on the economic plane had been to increase the aggregate productivity of the society in which the revolution had taken place through the expedient of creating a single large-scale economic unit out of the hundreds of small-scale economic units of which the society had previously been composed. Communities that had previously made their living by subsistence farming had now combined to increase their output and their income by learning to produce specialized commodities—not only agricultural but now also industrial—for export in exchange for imports of raw materials and foodstuffs. Parochial communities that had formerly been economically autarkic had thus now become economically interdependent; and even the largest and wealthiest of them could no longer resume its former economic autarky, however keenly it might regret the loss of it, since the penalty would have been a prohibitively precipitous fall from a now customary standard of living (in the material sense of the term).⁵ Thus the effect of the Western and the Hellenic economic revolution alike had been to give the society a new structure on the economic plane that was incongruous with its structure on the political plane. On the economic plane the society had now been unified, whereas on the political plane it had continued to be partitioned among a litter of parochial states. This incongruity had

¹ Gibbon, E.: 'General Observations on the Fall of the Roman Empire in the West', at the end of chap. xxxviii of *The History of the Decline and Fall of the Roman Empire*.

² See IV. iv. 156–85.

³ See IV. iv. 141–55.

⁴ See I. i. 24–25; IV. iv. 200–14; and IX. viii. 429–30.

⁵ The progressive integration of the Western World on the economic plane as a result of the Industrial Revolution has been noticed already in another context (pp. 313–14, above). 'Bare as they are and short their span, the annals reveal', not only in the United States but likewise in the World at large, 'a secular trend towards territorial expansion of business relations and a concomitant trend towards economic unity' (Mitchell, W. C.: *Business Cycles and their Setting* (New York 1927 (reprinted 1930), N.B.E.R.), p. 446. Cp. p. 456). 'The larger the agricultural element in a given nation, the less likely are that nation's business cycles to fit neatly into the international pattern over a long series of years. For two nations with large farming interests are not likely to have closely similar harvest fluctuations year after year' (ibid., p. 448). 'The quiet business forces working toward uniformity of fortunes must be powerful indeed to impress a common pattern upon the course of business cycles in many countries' (ibid., p. 450). 'Undoubtedly a larger proportion of the population' of Great Britain 'felt the impact of the trade cycle on their lives and fortunes in 1910 than in 1790' (Rostow, W. W.: *British Economy of the Nineteenth Century* (Oxford 1948, Clarendon Press), p. 44). We have already cited A. C. Pigou's dictum (in *Industrial Fluctuations*, 2nd ed. (London 1929, Macmillan), p. 11) that, by A.D. 1872, the industrial fluctuations in the economic activity of a Westernizing World had come to be oecumenical in their geographical range.

created a tension of a magnitude proportionate to its own; and the incongruity had been so extreme that the tension had become intolerable.

In the history of the Hellenic Civilization this tension had generated a Time of Troubles manifesting itself in two paroxysms of inter-state warfare, of which the second had been more devastating than the first;¹ and the idolization of the ephemeral institution of the city-state had died so hard in Hellenic hearts² that the troubles had lasted for four hundred years—from the outbreak of the Great Atheno-Peloponnesian War in 431 B.C. until the establishment of a *Pax Augusta* in 31 B.C.—before the rending tension had been relieved at last by a political revolution that had brought the political map of the Hellenic World into tardy conformity with a unitary economic map which had been in existence by then for at least five hundred years. The establishment of an Hellenic universal state to serve as a political framework for an Hellenic oecumenical economy had been achieved too late to save the life of the Hellenic Society; it had availed merely to bring it a temporary reprieve; and the expiry of this four-hundred-years-long period of grace had been the signal for the demise of a society which had inflicted mortal wounds on itself at least as early as the onset of the second paroxysm of its Time of Troubles in the Hannibalic War (*gerebatur* 218–201 B.C.). What was going to be the effect of the same tension, arising from the same incongruity, in the life of a Western World which, since the Industrial Revolution, had become, in its turn, a unity on the economic plane while continuing to be partitioned on the political plane among a litter of still, and indeed perhaps now more than ever, fanatically worshipped parochial sovereign states? Would the Western World, unlike the Hellenic World, succeed in arriving at some less belated and less radical solution of this problem than the *ultima ratio* of abolishing fratricidal warfare by abolishing the war-generating institution of Parochial Sovereignty through a liquidation of all existing parochial states and the establishment of a single universal state in their stead?

One discouraging symptom in Modern Western history had been the emergence there, first in Prussia and latterly in Germany at large, of a militarism that had been deadly in the histories of other civilizations. Militarism was a portentous moral evil because it was an abnormal one. The millions of human beings who had sacrificed wealth, happiness, and life itself in fighting the battles of some parochial state, whose subjects they had happened to be, had mostly gone to war, not because they had delighted in War for its own sake, but because they had more or less ruefully resigned themselves to war-making as an evil necessary for the preservation of another evil—Parochial Sovereignty—to which they had perversely said 'Be thou my good'.³ In contrast to this normal negative human attitude towards the evil of War, militarism was a state of mind in which War had ceased to be looked upon merely as a means of serving an idolized state and had become an idol and an end in itself; and this cult of War was manifestly something contrary to Human Nature.

On this showing, it was disquieting for a Western historian to recall in

¹ See V. vi. 287–91.

³ Milton: *Paradise Lost*, Book IV, l. 110.

² See IV. iv. 303–20.

A.D. 1952 that a Modern Western militarism in its pristine Prussian form had made its first appearance—*regnantibus Frederico Gulielmo I et Frederico II*, A.D. 1713–86—in an age in which, of all ages of latter-day Western history, the evil of War had been at its minimum.¹ Yet this Western militarism, as it had been practised in Prussia in the days of Frederick the Great and even in the darker days of Bismarck, had been, like the Hellenic militarism practised at Sparta in the days of Cleomenes I, a vice that had still been kept within bounds by a surviving respect for at least some of a civilization's traditional conventions. The more devastating militarism of a post-Bismarckian Prussia-Germany which had brought upon the Western World the catastrophe of A.D. 1914–18 had been a Western counterpart of a Spartan spirit, exacerbated by the Great Atheno-Peloponnesian War of 431–404 B.C., which had found its nemesis in 371 B.C. at Leuctra, or of a Babylonian militarism practised in Assyria in the days of Assurnazirpal II and Shalmaneser III (*regnabant* 883–824 B.C.). As for the mad-dog militarism of a National-Socialist Germany, this could only be compared with the last phase of the *furor Assyriacus*, after its temperature had been raised to the third degree by Tiglath-Pileser III (*regnabat* 746–727 B.C.).² It was true that, in A.D. 1952, it might look as if the fires of Western militarism had at least temporarily burnt themselves out, even in Germany, and at the same date it seemed improbable that even the virus of Russophobia would prove sufficiently inflammatory to kindle the same flame in the traditionally unpropitious atmosphere of the United States. Nevertheless, the fact that, no farther than seven years back, one of the principal nations of the Western World had been still waging an unprovoked war for war's sake, and this with all its might, was a fact of bad augury for the Western Civilization's prospects.

To set against these bad omens on a Western World's horizon in A.D. 1952 there were, on the other hand, certain more auspicious symptoms.

For example, the Epimethean self-worship of Venice and the other *ci-devant* city-states in Italy and Germany had yielded in the end to new allegiances in the course of the three or four generations running from A.D. 1789 to A.D. 1871; and, though at that stage the Venetians had merely exchanged their parochial loyalty to Venice for a parochial loyalty to Italy, and the Lübeckers their loyalty to Lübeck for a loyalty to Germany, the very fact that such old and, in their dotage, apparently hard-set idolatries had at least once been transcended gave some ground for hope that the descendants of those converts from the worship of a city-state to the worship of a nation-state might one day transfer their allegiance to a universal state between whose provinces war would be impracticable. It was also a good sign that, eighty-seven years after the forcible reincorporation of a Southern Confederacy into the United States, the descendants of bellicose Southern secessionists had become reconciled to a political destiny which had been imposed by force of arms upon their great-grandfathers.

Moreover, there was one ancient institution—no less evil than War itself—which the Western Civilization had plucked out and cast from it,

¹ See IV. iv. 142–50.

² See IV. iv. 473, n. 3.

albeit at the cost of a terrible civil war in one province of the Western World in which a 'peculiar institution' had been obstinately maintained for some thirty years after its abolition in the Western World at large.¹ A Western World which had succeeded in abolishing Slavery in the nineteenth century of the Christian Era might surely take heart from the memory of this unprecedented victory of a Christian ideal in a Western arena as it addressed itself in the twentieth century to Hêraklês' next labour, namely the attempt to abolish the coeval institution of War; for War and Slavery had been twin cancers of Civilization ever since this species of society had first emerged; and the nineteenth-century conquest of one of these two fell social diseases was therefore a good augury for the Western Society's prospects in its twentieth-century campaign against the disease of War.

The abolition of Slavery in a nineteenth-century Western World had also been a particularly notable triumph on two accounts. In the first place Slavery, like War, had been a potent cause of mortality among civilizations in the past. Slavery as an instrument of government and war had conspired with War itself to bring an Ottoman Civilization to grief;² Slavery as an instrument of specialization in economic production had similarly conspired with War to bring an Hellenic Civilization to grief during the second paroxysm of its Time of Troubles;³ and a Modern Western Society's decisive victory over an evil that had thus proved almost as puissant as War in defeating other civilizations in the past was therefore impressive evidence of moral health in a latter-day Western body social. The second reason why the abolition of Slavery in a nineteenth-century Western World was noteworthy was because this evil in this century in this social milieu had been raised to a potency without precedent in any previous chapter of Western history by the impact of the new motive-power of Industrialism. On the cotton plantations in 'the Old South' of the United States, Slavery had been harnessed to the production of a crop supplying the raw material for a mechanized textile industry which was the master craft of Industrialism in that stage of its development. A victory over an ancient social institution into which a youthful Industrialism had put a demonic new 'drive' was a victory that might well be pregnant with future moral triumphs.

Moreover, a Western Society that in A.D. 1952 was still being worsted by War, eighty-seven years after its triumph over Slavery, could take heart from its record on other spiritual battlefields where the issue was still in the balance.

In its response to a challenge presented by the impact of Industrialism on the institution of Private Property,⁴ the Western Society had already made some headway in Great Britain, the Scandinavian countries, New Zealand and Australia in forcing a passage between Scylla and Charybdis. The empirical compromises between Free Economic Enterprise and Socialism that were being worked out in those countries in that generation promised on the one hand to steer clear of an untempered economic individualism that would have driven all but a masterful minority to the

¹ See IV. iv. 137-41.

² See III. iii. 22-50.

⁴ See IV. iv. 191-2.

wall if economic enterprise had been left uncontrolled in an age in which Industrialism had put a demonic 'drive' into it, while on the other hand this homoeopathic inoculation of a disordered body social with a moderate dose of socialism was a prophylactic against the danger of the society's succumbing to a totalitarianism that would have imposed on human beings the social justice of the ant-heap and the beehive at the cost of forcibly depriving them of Man's distinctive birthright of freedom.

In the same generation the Western Society had also been achieving some success in coping with the impact of Democracy upon Education.¹ In throwing open to the majority an intellectual treasure-house which had been a small minority's jealously guarded and oppressively exploited preserve since the dawn of Civilization,² the Modern Western spirit of Democracy had given Mankind a new hope at the cost of exposing it to a new danger. The danger lay in the opening which a rudimentary universal education gave for propaganda, and in the skill and unscrupulousness with which this opportunity had been seized by salesmen for advertising their wares and by news agencies, 'pressure groups', political parties, and the public relations departments of firms and governments for 'selling' their policies. The hope lay in the possibility that these exploiters of a semi-educated public would prove unable to 'condition' their victims so thoroughly as to succeed in preventing them from continuing their education; for, if only they could continue it, it might be expected to carry them to a point at which they would begin to become capable of detecting intellectual dishonesty and penalizing intellectual foul play.

Education was a two-edged sword which could be used at will, by the powers that wielded it, either for opening the minds of their fellow human beings to a liberating truth³ or for subduing them to a cramping dogma. At the time of writing, when this mental strife between Enlightenment and Obscurantism was raging *aequo Marte* in the 'democratic' as well as the 'totalitarian' provinces of a Westernizing World,⁴

¹ See IV. iv. 192-8.

² See IV. iv. 418-21.

³ John viii. 32.

⁴ The extent to which people's opinion and feelings were being 'conditioned' in the West in the twentieth century of the Christian Era, even in a Western country that boasted of itself that it was democratic, had been brought home to the present writer by an amusing incident at an unofficial international conference convened at Kyoto in the autumn of A.D. 1929 by the Institute of Pacific Relations.

This conference was attended by representatives of a number of countries with frontages on the Pacific Ocean; and, when English-speaking Westerners from the United States, Canada, Australia, New Zealand, and the United Kingdom found themselves sitting round the same table with Chinese and Japanese colleagues, they put their heads together and decided with one accord to improve the shining hour by doing something, out of school, to advance their Oriental colleagues' education in the principles of 'Democracy'. To this end they planned a series of evening meetings at which distinguished 'Anglo-Saxon' speakers were to hold forth to a voluntary class of Oriental neophytes on divers aspects of this beatific Western institution, and they placed 'Public Opinion' at the head of their select list of edifying topics. On the appointed evening their Oriental colleagues courteously presented themselves, the distinguished Anglo-Saxon speaker spoke his lines, and the Anglo-Saxon chairman then called for questions in an intonation suggesting that he expected the response to be a negative one, while the Anglo-Saxon supporters of the chair sat back in a row and relaxed with the air of men who had accomplished a meritorious evening's work. The atmosphere changed, however, from one of drowsy complacency to one of expectant amusement when a little Chinese lady, sitting in the back row, asked permission, not to put a question, but to make a statement. What on earth could a middle-aged headmistress from Changsha, in the far interior of China, have to say?

— 'During the war', meaning the war of A.D. 1914-18, the little lady began, 'I was living

there was no reason to take it as a foregone conclusion that an insidious Propaganda would win a permanent victory anywhere over an innate Human Intelligence. The impact of Democracy upon Education, however, was not so formidable a challenge to the Spirit of Man as the impact of Civilization, reinforced by the 'drives' of both Democracy and Industrialism, on the Division of Labour and on an indispensable but perilous social drill which we have labelled 'mimesis';¹ yet these, again, were not the battlefields that were likely to prove decisive for the Western Civilization's destiny. The plane on which the decisive spiritual battle was likely to be fought was neither the military nor the political nor the social nor the economic nor the intellectual; for in A.D. 1952 the crucial questions confronting Western Man were all religious.

Had the fanatically positive Judaic, if not the unfanatically negative Indic, higher religions been discredited beyond repair by the incriminating historical record of an intolerance that had given the lie to their professions?² Was there any virtue in the religious toleration into which a Western World, disillusioned by the inconclusive savagery of the Wars of Religion, had subsided towards the close of the seventeenth century of the Christian Era, at the opening of a Late Modern Age of Western history?³ How long would Western souls find it bearable to go on living in an empty, swept, and garnished house?⁴ And, now that the discomfort of a spiritual vacuum had tempted them to open the door to such devils as Nationalism and Fascism and Communism, how was their vaunted latter-day conversion to a belief in tolerance likely to stand this test? Toleration had been easy to practise in a lukewarm age of Western history in which all varieties of Western Christianity had lost their former hold on Western hearts and minds, while these had not yet found any alternative objects for their frustrated devotion. Now that they had gone a whoring after other gods,⁵ would an eighteenth-century toleration hold its own against a twentieth-century recrudescence of a seventeenth-century fanaticism which, in Gibbon's naïvely optimistic belief, had been exorcized once and for all from the precincts of a 'polite' society? And, even supposing that a fanatical intolerance were to bring upon itself, once again, when harnessed to the service of idolized parochial states, the discredit into which it had eventually fallen when it had raged in the service of warring Western Christian sects, might not this vice even then regain its hold on human hearts and minds once more by

in Blackheath"—and, at the mention of this familiar suburb of London, the Englishmen in the room all woke up with a start. 'I was living in Blackheath,' she went on, 'and travelling to my office in London every morning in a suburban train; so I could observe what newspapers my fellow-travellers were reading, and could listen to their comments on the news of the day. After a few days of this, I found myself able to tell each of them what his views would be before he had opened his mouth. "Now you have been reading *The Daily Mail*," I would say to one of them, "so your opinions on this morning's news will be such and such. You, though, have been reading *The Daily News*, so your opinions will be these". These predictions were fairly simple,' she said, 'so I thought I should like to tell you about this experience of mine, as a small contribution to a study of public opinion—at least, as this is understood in the West.'

This was enough. That same evening, before going to bed, the Anglo-Saxon committee for the education of Orientals in Democracy held an emergency meeting and cancelled the rest of their programme.

taking service, this time, with an idol standing, not for division, but for unity?

Wanderers in a Western wilderness, astray from their forefathers' One True God, who had been taught by a further bout of disillusioning experience that parochial states, like sectarian churches, were idols whose worship brought not peace but a sword,¹ might be tempted to seize upon a Collective Humanity as an alternative object for idolization.² A 'religion of Humanity' which had missed fire in the frigid mould of a Comtian Positivism had set the World ablaze when it had been fired from the canon's mouth of a Marxian Communism. Would a life-and-death struggle for the salvation of souls which Christianity had waged and won in its youth against an Hellenic worship of a Collective Humanity embodied in oecumenical cults of Dea Roma and Divus Caesar have to be fought out again, two thousand years later, against some latter-day embodiment of a worship of the same Leviathan? The Hellenic precedent raised the question without revealing the answer to a mid-twentieth-century inquirer into the Western Civilization's prospects.

If, in our review of Western experiences with non-Western precedents, we now pass on from the symptoms of breakdown to the symptoms of disintegration, we shall recall that, in our analysis of schism in the body social, we found unmistakable traces, in a latter-day Western World, of the epiphany of a dominant minority³ and of an internal and an external proletariat.⁴

The Western World's external proletariat will make little demand upon our attention; for our general conclusion⁵ that the barbarians had played no more than an insignificant part in the histories of the civilizations was conspicuously borne out by the situation on the Western World's anti-barbarian marches at the time of writing.⁶ The fate of the surviving barbarians had been sealed, as far back as the seventeenth century of the Christian Era, by the success of two sedentary Powers in encircling a Eurasian Steppe that had been the most devastating source of barbarian eruptions for at least three thousand five hundred years; and, though neither the Russian nor the Manchu Power had been a Western polity, their combined achievement had redounded to the benefit of a Western Civilization that had been expanding all over the *Oikoumenê* thanks to a mastery, not of the Steppe, but of the Ocean. By A.D. 1952 the last surviving enclaves of still recalcitrant barbarians were all manifestly on the verge of being eliminated. By the same date, however, it could already be foreseen that the barbarians would not pass out of existence without leaving their mark on the life of their victorious antagonists.

At the very moment when a Western Society armed by a Western Science was conquering the barbarians in the flesh, Barbarism was taking its revenge by finding its way into the souls of its Western conquerors.⁷ A regressive Western Neobarbarism, which, in the breathing-space between a First and a Second World War, had made so disconcerting an epiphany first in Italy and then in Germany,⁸ was, of course, morally far

more evil and politically far more formidable than the relatively innocent pristine Barbarism into whose heritage it had entered; and this evil had not been exorcized from Western souls by the military overthrow of an Italian Fascism and a German National-Socialism; for this perverse Western manifestation of Original Sin was an occupational disease of a semi-educated urban lower middle class that was as ubiquitous as the Western Civilization itself,¹ and there was perhaps no province of the Western World in which this class was not in some danger of succumbing to this malady. In an inter-war Italy and Germany, the heart of the disease had shown itself to be a morbid state of public opinion and feeling that was sufficiently malignant, and at the same time sufficiently widespread, to give an opening in public life for criminal activities. In this odious atmosphere a villain could count on being able to win popularity and power for himself by making preposterously false charges against the innocent, since it was an atmosphere in which the innocent had only to be accused of impiety against the current idols of the market-place to find themselves permanently under a cloud, however conclusively they might have proved their integrity, while the unscrupulous had only to launch such accusations to find themselves the heroes of the hour, even when they had been convicted of having known their charges to be false before they had launched them. In A.D. 1952 a touch of this painfully familiar inter-war Italian and German atmosphere was perceptible in the United States; and, though, in a North American social milieu, this spiritual malaria might be expected to bring about its own cure by stimulating a host of antagonistic spiritual forces to deliver a vigorous counter-attack, it was nevertheless disquieting for all people of good will in a stricken and beleaguered Western Community that such symptoms should have manifested themselves at all in the one Western country that, after a Second World War, still remained capable of serving as the arsenal, citadel, and conning-tower of Democracy in the Western sense of the word.

In the same chapter of Western history a vanishing external proletariat was also leaving its mark on Western life in a more direct and concrete way; for the *ci-devant* barbarians were being eliminated for the most part, not by being physically exterminated, but by being transferred to the ranks of a Western internal proletariat which by this time had come to embrace a great majority of the living generation of Mankind.²

The thus forcibly domesticated *ci-devant* barbarians were actually one of the smallest of the contingents of which this vast twentieth-century Western internal proletariat was composed. A far larger quota of the human beings who had been reduced to the status implied in the word 'Natives'³ by the sweep of a latter-day Western imperialism⁴ were children of non-Western civilizations that had been caught, like the last of the barbarians, in a world-encompassing Western net. A third contingent—the most unhappy and therefore the most actively dissident of the three—consisted of *déracinés* of divers origins, Western as well as

non-Western, who had suffered divers degrees of coercion. There were the descendants of African negroes who had been taken prisoners or kidnapped, been sold into slavery, and been forcibly transported beyond the Atlantic to the Americas;¹ there were the descendants of indentured Indian and Chinese coolies whose migration overseas had often in effect been just as involuntary as the African's, even though their virtual servitude might have been imposed on them under the legal cover of a formal contract. There were the descendants of transported West-European indentured servants and convicts² whose prospects had been less tragic than those of the Asiatic coolie or the African slave, since these temporarily disfranchised children of a Western household had been able to look forward to recovering their personal liberty after they had worked out the term of their sentence, and to finding themselves thereafter in as good a position as any voluntary emigrant of their own race to take advantage of opportunities offered by a new country. There were exiles whose banishment had been the penalty, not of real or imaginary crimes or misdemeanours, but of imputed heresies—religious, political, or ideological.³ And there were emigrants who had chosen to go into a voluntary exile rather than continue to put up with a state of hopeless poverty to which the niggardliness of Nature or the injustice of their fellow men would have continued to condemn them if they had clung to an ancestral home.

There were other *déracinés* who had been uprooted without suffering a sea-change. The most flagrant examples of 'proletarianization' in a post-Modern Western World were 'the Poor Whites' in 'the Old South' of the United States and in the Union of South Africa, who, after having crossed the Ocean in order to better themselves, had sunk to the social and moral level of their more successful fellow colonists' imported or indigenous African helots.⁴ There was an agricultural proletariat in Great Britain whose status had been depressed, not by the direct competition of helot 'Native' labour in their homeland, but by the ability of a West European country that had temporarily become 'the workshop of the World' to buy cheap mass-produced foodstuffs from overseas in exchange for exports of British manufactures. And there was an industrial urban proletariat⁵ which, in Great Britain first of all, and thereafter in one country after another in a Western and a Westernizing World, had been drawn off the land into the city as a fall in the death-rate—bringing this down to ever lower levels over a Time-span of five or six generations before the restoration of the balance by a compensatory fall in the birth-rate—had made the creation of an unhappy urban proletariat the only alternative to the multiplication of an even more unhappy rural one.⁶ This urban proletariat seemed in A.D. 1952 to be on the way to becoming as world-wide⁷ as a Western standard of public health which was the ultimate cause of its epiphany, and as a Western style of Technology which was its staff of life; but there was another contingent of *déracinés* uprooted *in situ* which was the peculiar product of originally

¹ See II. ii. 218.

⁷ See V. v. 155–6.

non-Western societies that had found themselves forced to conform in some degree to an alien Western way of life. An *intelligentsia*, called into existence to serve as a corps of interpreters between a proletarianized 'Native' society and an importunate Western 'ascendancy',¹ was, as we have observed, the most unhappy and the most explosive of the many ingredients of which a world-conquering Western Civilization's world-wide internal proletariat was composed.

The relations between a Western internal proletariat and a Western dominant minority were further aggravated by a 'colour-bar' in countries where there was an indigenous or imported proletariat that happened to have been stamped with the physique of a Black, Brown, or Yellow Race, and where the dominant minority had been recruited from Teutonic-speaking descendants of those White barbarians who had battered on the carcass of a dead Hellenic body social some fifteen hundred years back in the past. At the time of writing, the worst offenders were the Dutch-speaking lords and masters of the Union of South Africa; but the same fundamentally Fascist régime—making a class-distinction ineffaceable by identifying it with a race-distinction—was being maintained under the auspices of English-speaking cousins of the Afrikaners in Kenya Colony, in 'the Old South' of the United States, and in some respects—as, for instance, in a *de facto* segregation of domiciles—also in other sections of the North American Republic. Thus, in both a South African and a North American province of a latter-day Western World, a 'colour-bar' between divers communities sharing a common country was setting up, in a new social environment, the institution of Caste, which, in an Indic World that had been blighted by it, had likewise originated in a 'colour-bar' according to the tell-tale evidence of its Sanskrit name.²

In these circumstances it was not surprising to find a Western internal proletariat retorting to repression by exploding in outbreaks of retaliatory violence³ reminiscent of the classical explosions during the second paroxysm of an Hellenic Time of Troubles.⁴ The earliest of these outbreaks had occurred in an expanding Western Civilization's West European homeland; but the Anabaptist terror at Münster in A.D. 1543-5 and the successive Jacobin and Communard terrors in Paris in A.D. 1792-4 and in A.D. 1871 had been dwarfed in scale, though perhaps not surpassed in vindictiveness, by the insurrection of that vast majority of a latter-day Western internal proletariat which was of non-Western origin. The first of these anti-Western counter-attacks had been launched by Peter the Great, the Russian prototype of the Herodian saviour-king in a Westernizing World, in the Great Russo-Swedish War of A.D. 1700-21; but the consequent cession of the Baltic Provinces and the Karelian Isthmus by an eighteenth-century Western to an eighteenth-century Westernizing Power⁵ was a trifling loss for the Western Community

¹ See V. v. 154-8.

² 'Colour' is the literal meaning of *Varna*, the Sanskrit word for which the Modern Western languages had found an equivalent in the Portuguese word *Casta*.

compared to the sweeping reversals of Western conquests during the fifth decade of the twentieth century.

In the General War of A.D. 1939-45, Russia had profited lucratively by her victorious alliance with the English-speaking Western Powers against a National-Socialist German Neobarbarism that had rankled into hideous life within the Western Society's bosom when in Germany a long since repressed abomination of desolation¹ had risen again, like an evil genius, from the depths of a collective Western subconscious psyche. In A.D. 1944-5 a Soviet Union, that had been compelled in A.D. 1918 to renounce Russian sovereignty over all Western territories that had been annexed by Russia since the days of Peter the Great, had re-established a Russian ascendancy over the Western World's East European marches; and this time Russia had succeeded in bringing under her domination a far larger portion of the Western Civilization's Continental European patrimony than had ever fallen under a Petrine Russia's rule. After the War of A.D. 1939-45, Russia had not only reannexed the Balticum and the Karelian Isthmus and suspended a sword of Damocles over Finland's head; she had enveloped the whole of Poland, Czechoslovakia, and Hungary, and large fractions of Germany and Austria, within her 'iron curtain'. These East European marches of the Western World were being kept under a Communist Russia's control by indigenous Communist parties with the backing of an undemobilized Russian Army; and this deft manoeuvre of harnessing volunteer non-Russian running-dogs to the sledge of a Russian imperialism was being practised by the statesmen in the Kremlin not only in Europe but in Asia as well.

In Eastern Asia, Russia had been the beneficiary of Japanese conquests which had been as extensive as they had been short-lived; for, ephemeral though they had proved to be, these triumphs of a non-Western Great Power over Western empire-builders on Asiatic ground had irretrievably shattered the myth of Western invincibility. In the Philippines, Hong Kong, Malaya, Indonesia, Indo-China, and Burma in A.D. 1941, the Western strong man armed had met one who was stronger than he;² and the signal retribution that had afterwards overtaken a Japanese black dragon had not availed to set up a Western humpty-dumpty again in the esteem of his former Asian subjects. In their suicidal act of breaking the West's spell over Asian souls, the twentieth-century Japanese disciples of the Forty-Seven Rōnin had let loose, out of Aeolus's wind-bag, the long-pent-up spiritual force of Asian resentment against a Western ascendancy which had been all the more galling for being asserted on the cultural level as well as on the economic, the political, and the military; and an anti-Western crusade which had been half-hearted so long as it had had to be carried on by quislings in the service of a nakedly self-seeking Japanese nationalism had been resumed, after Japan's defeat, with a novel enthusiasm under the banner of a Communism in which a self-seeking Russian nationalism was artfully camouflaged. In 1952 it looked as if Chinese Communist armies that had, in effect, been fighting Russia's battles in Korea might have it in their

¹ Matt. xxiv. 15 and Mark xiii. 14, following Dan. xi. 31 and xii. 11.

² Luke xi. 21-22.

power to sweep off the Asiatic chess-board most of the Western pawns that had been precariously replaced on it in A.D. 1945.

The example of an insurgent Asia might be followed by an effervescent Africa whose soldiers had seen the World and taken stock of it in the South-East Asian and West European war-zones of a Second World War; and, as the spark ignited by Russian Communism travelled along a train of gun-powder long since laid by Western imperialism, it was not inconceivable that it might fire the native peasantry in a chain of Latin American republics, from Mexico to Paraguay inclusive, that had been planted on the volcanic soil of buried Andean and Central American worlds. A conflagration that had started in Mexico in A.D. 1910 by spontaneous combustion might spread to Peru and Bolivia if the flame were to be fanned by Communism's forced draught. In short, a world-wide proletarian revolt against a world-wide Western ascendancy had now become a possibility with which the West had to reckon; and, for a Western Society at bay, this prospect was daunting.

At the same time there were a number of less sensational, but not necessarily on that score less substantial, entries on the other side of the account.

The first point that might come to tell in a menaced Western Civilization's favour was the alloy of Russian nationalism in an Oecumenical Communism that professed, with a show of Pauline fervour, to have risen superior to all invidious distinctions between Jew and Greek or bond and free.¹ For this vein of insincerity, however adroitly it might be veiled, was a flaw in the physique of Communism which exposed it to the danger of death by thrombosis. At a moment when in Eastern Asia the Western cause was suffering grievous immediate adversity, a Western telepathist who could have looked into the hearts of the close-lipped statesmen in the Kremlin might have learnt that they were watching their Chinese allies' rather spectacular military successes against their common Western adversaries with not unmixed feelings. Would Chinese Communists elated by victories over the greatest Power in the Western camp be content to dance to Russia's tune thereafter? The future of Manchuria, Mongolia, and Sinkiang was, after all, of vastly greater importance for China and for Russia alike than the future of Indo-China, Hong Kong, and Formosa. The territorial issues between China and Russia were, in fact, both more momentous and more intractable than those between China and the West. Might not a Communist China, flushed with her demonstration of her ability to engage the United States in battle on equal terms, round on Russia with the cutting observation that, in accordance with the Marxian Religion of Humanity that both Russia and China professed, what was sauce for the American goose must be sauce for the Russian gander. A now hard-pressed Western World might perhaps live to see a Communist Russia's Asian Communist allies go a Communist Yugoslavia's way; and, at a moment when eager voices were being raised in the United States for a precipitate rearming of a Germany and a Japan who had been flying at the Western Community's throat only seven or eight years back, an English observer could look forward in his

¹ 1 Cor. xii. 13; Gal. iii. 28; Eph. vi. 8; Col. iii. 11.

imagination to a perhaps not distant day when the same voices would be hailing Holy Russia as 'the White Man's hope'.

This no doubt at first sight unconvincing prognostication had a solid basis in two indisputable facts. Russia was the only major province in the patrimony of the White Race in which the population was increasing in the twentieth century at the rate at which it had increased in the nineteenth century in Western Europe and North America; and Russia was also the province of the White Race's patrimony which marched with the Continental frontiers of China and India. If either or both of these two sub-continents, which, in the twentieth century, each housed nearly one quarter of the living generation of Mankind, were ever to succeed in carrying the process of Westernization on the technological and organizational planes to a point at which Chinese or Indian 'man-power' would begin to count—in contemporary Western terms of economic, political, and military strength—in proportion to its immense strength in sheer numbers, it was to be expected that a reinvigorated Samson would insist—under threat of pulling down the pillars of Humanity's house—on a drastic revision of the grossly inequitable distribution of the World's natural resources in territory, raw materials, and food producing capacity which had been the consequence of the West European peoples' conquest of the Ocean in and after the fifteenth century of the Christian Era. In such not inconceivable circumstances, Russia, in struggling to preserve her own existence, might find herself involuntarily performing, for a Western World snugly sheltering under her lee, the unrewarding service of acting as a buffer that the main body of Orthodox Christendom had once involuntarily performed for the same Western World when the explosive quarter of the Continent had been, not China or India, but a South-West Asia politically reunited under a dynamic Primitive Muslim Arab leadership.¹

In A.D. 1952 it would, no doubt, have been folly for a Western World that had been thrown on the defensive by a Russo-Chinese *entente* under the banner of Communism to count upon any possibility of a future breach between the two titanic non-Western Powers that were now co-operating with one another in an anti-Western campaign. There was perhaps more legitimate ground for encouragement in the fact that a Western Community which had come into headlong collision with the Chinese in Korea and which was desperately embroiled with the Vietnamese in Indo-China had managed to come to terms with the Indonesians after having crossed swords with them on the morrow of the 'liberation' of the East Indian archipelago from the Japanese, and had voluntarily abdicated its dominion over the Filipinos, Ceylonese, Burmans, Indians, and Pakistanis by amicable agreements that had not been sullied by any stain of bloodshed.

The voluntary liquidation of American rule in the Philippines was perhaps not so remarkable—though an English observer could hardly claim to be an impartial judge in this case—as the voluntary liquidation of a British Rāj in India that was not only a hundred years older than the American régime in a former dominion of the Spanish Crown but had

¹ See I. i. 156; II. ii. 376-9; and III. iii. 276, n. 1.

also come to count for far more in the life of the ruling Western country. When, on the 18th July, 1947,¹ Great Britain had completed the fulfilment of a pledge, first made on the 20th August, 1917,² to grant full self-government to India by stages at the fastest practicable pace, the Western country that had carried out this transfer of political power on this scale without having been constrained by any immediate *force majeure* had performed an act that was perhaps unprecedented and was certainly auspicious for the future, not merely of the Western Civilization, but of the Human Race.

In thus bestowing political independence on a sub-continent which they had originally brought under their rule by force of arms during a bout of anarchy at a late stage of a Hindu Civilization's disintegration, the British people had been inspired by an indelible memory of their disastrous failure in the eighteenth century to retain the allegiance of their own kinsmen and colonists in North America. This redoubtable lesson had burnt into their souls a conviction that it was as unwise as it was unwarrantable to attempt to rule other people by force when they could no longer be governed with their own consent, and that the right and statesmanlike course was always to grant self-government to a subject population that was demanding it in time to avoid the humiliation of being forced at last to concede it at the bayonet's point. This was the psychological background in British hearts and minds to the historic act of the 18th July, 1947; but so novel and difficult a political undertaking could hardly have been carried peacefully to success if the psychological atmosphere had not been propitious on both sides. The transformation of a British Rāj into the three independent Asian states of India, Pakistan, and Burma had been a joint achievement of the British people and their former Continental Asian subjects; and the Asian contribution had been a Hindu spirit of non-violence which had been blended with a Western spirit of non-violence—the living tradition of the Society of Friends—in the soul of the Mahatma Gandhi. The spiritual worth of this joint achievement and the genuineness of the co-operation between Westerners and Asians that had been the secret of its success were attested by the immediate transformation of a previous bitterness on the Asian side and a previous irritation on the Western side into a mutual esteem and friendship founded on a common sense of relief and satisfaction at having found, in concert, a happy issue out of a strange and awkward, but perhaps fatefully creative, encounter between the children of such diverse civilizations as the Western, the Hindu, the Islamic, and the Indic.³

This notable reconciliation between an Asia represented by various communities formerly subject to a British Rāj and a Western Society represented by British protagonists in the drama of Late Modern Western imperialism opened up a prospect that—in spite of a Communist

¹ This was the date on which the Royal Assent was given, at Westminster, to an India Independence Act enacted by the Parliament of the United Kingdom. The formal assumption of authority by the Governments of the Indian Union and Pakistan followed on the 15th August, 1947.

² In the House of Commons at Westminster by the Secretary of State for India, Mr. Edwin Montagu.

³ For a diagnosis of the Hinayanian Buddhist communities in Ceylon, Burma, Siam, and Cambodia as fossils of an otherwise extinct Indic Civilization, see I. i. 35.

enemy's assiduity in sowing tares in an expansive Western Civilization's Asiatic field—some part, at least, of the vast Asian contingent in an oecumenical Western internal proletariat that had been heading towards secession from a Western dominant minority might be moved to change its course in order to make for the alternative goal of entering into a social partnership on terms of political and psychological equality with its former Western masters. In that event, a world order, embracing the whole habitable and traversable surface of the planet, which had originally been established by Western force of civil and military technology on the inequitable basis of a Western minority's ascendancy over the rest of Mankind, might perhaps be saved from being shipwrecked on the rock of its own primal injustice through being converted into a common home for the whole Human Race, in which all members of the family would find themselves able to dwell together in unity¹ under the impartially hospitable roof of a house of many mansions.²

In Asia and in the North African province of an Islamic World the reconciliation of a world-encompassing Western Society's internal proletariat to its dominant minority seemed most likely to come about through the grant of local self-government to previously subject peoples within the framework of a political world order in which all states would enjoy an equal measure of liberty, while none of them would be free to exercise the licence of unlimited sovereign independence. The same open road to corporate membership in an oecumenical society seemed also to lie ahead of un-uprooted representatives of the Black Race in West Africa south of the Sahara whose continuing possession of their ancestral homes was guaranteed to them by the benevolence of a climate that made it impossible for any representatives of the White Race to enter in and dwell there³ permanently. A reconciliation was manifestly more difficult in provinces of a Westernizing World in which the representatives of visually diverse races were citizens of the same country, working in the same fields and factories, and living in adjoining quarters of the same villages, towns, and cities. Yet the 'colour-bar' that had been a Dutch-speaking and English-speaking White dominant minority's inhuman response to this heart-searching challenge in South Africa and in North America north-east of the Rio Grande was not the only answer that had been found by European pioneers of the Western Civilization who had called into existence overseas new communities composed of diverse races.

The French, for example, had shown themselves ready to fraternize with any convert to the French version of the Modern Western culture, and the Spaniards and Portuguese to fraternize with any convert to the Roman Catholic version of a Western Christianity, whatever the colour of the proselyte's skin might happen to be;⁴ and, though, in a post-Modern Age of Western history, the Romance-speaking representatives of the Western Civilization outside Europe might count for less than its Teutonic-speaking representatives, their older and more humane Western solutions for the problem of 'the clash of colour' were at any rate

¹ Ps. cxxxiii. 1.

³ Matt. xii. 45; Luke xi. 26.

² John xiv. 2.

⁴ See IX. viii. 565-6.

still in the field as alternatives to a 'colour-bar' which, so far from solving the problem, grievously aggravated it. The living examples of these happier alternative responses might perhaps still have some effect on the eventual handling of the race problem in English-speaking provinces of a Westernizing World in which the 'colour-bar' was a stumbling-block to Protestant as well as Catholic Christian consciences.

In the United States, in particular, at the time of writing, the tendency of a 'colour-bar' to harden into a caste-distinction on Indic lines was being resisted by the counter operation of the spirit of Christianity; and, though, at the time of writing, it was still impossible to tell whether this Christian counter-attack was a forlorn hope or whether it was 'the wave of the Future', it was at least a good omen that in the United States, as in India, the redeeming spirit had been at work on both sides. In the hearts of a dominant North American White majority a Christian conscience that had insisted on abolishing the evil institution of Negro Slavery at the cost of a civil war within the bosom of the White community had come to realize that a merely juridical emancipation was not enough, and had been moved by the Apostle's warning of the spiritual unprofitableness of good works, if these were not hallowed by Christian love,¹ to press on towards the more elusive goal of winning for a juridically emancipated Negro minority a social and psychological equality for lack of which the bare legal status of personal freedom had proved to be as bitter to the taste as Dead Sea fruit. This indefatigably sustained Christian endeavour on the part of a White minority that was the salt of this North American earth would, however, have been of little avail if a Christian spirit on a Coloured minority's side had not been ready to respond to a contrite White minority's Christian overtures. In other contexts² we have admired the spectacle of a Negro *anima naturaliter Christiana* taking to heart, in a New World that, for the African slave, had been a land, not of hope and glory, but of exile and servitude, a Christianity that had left no mark on the stony hearts of White slave-traders and slave-owners who had been its incongruous and impervious carriers. In North America, as in India, if the schism in the body social were eventually to be healed, the salvaging of a disintegrating civilization would, once again, have been Christianity's achievement.

A third arena in a Westernizing World in which Christianity had been battling with an inhumanity that had been making for social disruption was on the Western Society's home front, and on this front the critical sector was a Britain that had been the scene of the first eruption of a Late Modern Western Industrial Revolution. If, in the generation in which this visitation was conjuring into existence the English vanguard of an oecumenical industrial urban proletariat, John Wesley (*vivebat* A.D. 1703-91) had not devoted a long life to evangelizing an English under-world to which an eighteenth-century Established Church had heartlessly turned a blind eye, who can tell that the tribulations to which this pastor's sheep were subjected during the half-century following his death might not have goaded them into savagely militant insurrections of the kind that had once devastated a disintegrating Hellenic World in

¹ 1 Cor. xiii, *passim*.

460 PROSPECTS OF THE WESTERN CIVILIZATION

the course of the second paroxysm of an Hellenic Time of Troubles in the second and the last century B.C.¹ It was thanks to the labours of Wesley and his fellow Christian evangelists in the eighteenth century of the Christian Era that in the nineteenth and twentieth centuries a slowly maturing political Labour Movement in Great Britain had not taken either an anti-clerical or an anti-constitutional turn.

The bloodless political revolution through which India had obtained her emancipation from a British Rāj on the morrow of the War of A.D. 1939-45 was not more remarkable than a simultaneous bloodless revolution in Great Britain through which a Western country, where power, wealth, and opportunity had been, within living memory, the close preserve of a scandalously small and odiously over-privileged minority, had now peacefully transformed itself, without vindictiveness on the majority's part and without rancour on the minority's, into a community in which a maximum of social justice had been secured at the cost of a minimal sacrifice of individual liberty. These two liberal and constructive non-violent revolutions—one in Great Britain and the other in India—on the morrow of a devastating war were achievements in which any living Englishman could take pride, for whatever party he might happen to have cast his parliamentary vote.²

¹ See V. v. 68-71.

² The writer of this Study, for example, who was not a member of the Labour Party, had found himself moved, on visits to the United States during the years A.D. 1947-52, to expound the ideals and commend the policy of the Labour Movement in the United Kingdom to middle-class American critics whose attitude towards British Labour was one of suspicion inclining towards hostility.

In the sight of these American onlookers this policy was obnoxious on two grounds. They deemed it in the first place socially superfluous, and in the second place politically untoward. It seemed to them superfluous because in the United States no regimentation or socialization had been required in order to enable the industrial workers as a group to share in a continuing general rise in the national standard of material living; it seemed dangerous because, in their expectation, even a modicum of socialism was bound to act as the thin end of a wedge which must eventually prise the last remnants of individual liberty out of the body social, and was consequently bound in the end to clamp the yoke of a totalitarian régime *à la Russe* on the necks of the whole nation, including the deluded industrial workers whose misguided socialist leaders had set this fatal train of events in motion. It was difficult at this date for an Englishman, even if he were in the forensically strong position of not being a member of the Labour Party himself, to convince his American interlocutors that the leaders of the British Labour Movement, as well as the rank-and-file, were as constitutional-minded as any British Conservative or any American Republican; that the British trade union organization had been built up in accordance with a national tradition of keeping elected representatives under their constituents' control; that the British working class set immense store by their trade unions, as going concerns which they had created for themselves and which had proved their value to them by enabling them over the course of decades to obtain notable successive improvements in their standard of living; that this trade union organization could only survive (as had been demonstrated by the fate of the trade unions in a Communist Russia) in a social milieu in which Labour and Capital were free to bargain with one another; and that, if ever the logic of events were to force British Labour to choose between the preservation of their trade unions' right to negotiate and right to strike and the assertion of the absolute authority of a socialist state, a doctrinaire socialism, not a traditional trade unionism, was the cargo that would go by the board. It was no less difficult to convince middle-class Americans at this time that a modicum of socialism was, nevertheless, also indispensable if the minimum standard of living was to be raised substantially in a country whose aggregate national income and resources were as small as those of the United Kingdom were by comparison with those of the United States.

In putting these considerations before middle-class Americans the writer was always at pains to make it clear that his defence of British Labour policy was a defence of its application in Great Britain under current conditions of life in that particular country, and that he was not advocating it as a panacea for all countries in all circumstances. The United States, for example, with its vast already-developed national wealth and vast

The foregoing survey of facts telling against, as well as in favour of, the likelihood of the Western Civilization's coming to grief through the secession of an internal proletariat suggests two tentative conclusions. In the first place, the forces of reconciliation and recuperation that were in the field against the forces of schism and disintegration in the Western World at this stage in its history appeared to be stronger than any corresponding forces that might have been at work in the Hellenic World in the course of the second paroxysm of an Hellenic Time of Troubles in the second and the last century B.C. In the second place, this difference, to the Western World's advantage, between these two comparable passages of history appeared to be mainly due to the continuing operation of a spirit of Christianity that had not lost its hold over the hearts of latter-day Western men and women when their minds had eventually rejected an outworn creed in which the abiding spiritual truths of Christianity had been translated into the ephemeral language of a pagan Hellenic philosophy.¹

This persistent vitality of a higher religion which had once provided a larval Western Civilization with its chrysalis was an element in the Western situation in the twentieth century of the Christian Era that had been conspicuously absent in an otherwise comparable Hellenic situation in the last two centuries B.C.; and it seemed not unreasonable to conjecture that there was some relation of cause and effect between this apparent invincibility of a living higher religion and the paucity and jejunity of the new crop of religions of the same species that were raising their heads in a Westernizing World at this time. The Bahā'iyah and the Ahmadiyah² might be approximate counterparts, in the current chapter of Western history, of religions that had competed with Christianity for the conversion of an Hellenic World in its universal state; and Communism might resemble the Mahāyāna in being a religion that had been conjured out of a philosophy. But Communism had already fallen into the aberration

reserve of still-untapped national resources, might, for all he knew, be able to make just as near an approach towards the democratic ideal of a classless society as had been made in A.D. 1945-51 in the United Kingdom under a Labour régime, without finding herself compelled to have any recourse to regimentation or socialization. However that might be, it was in any case an historical fact, as far as a foreign observer could judge, that, in the United States so far, there had been no appreciable signs of a tendency for an industrial urban proletariat to secede from Society. In the United States the industrial workers had not gone through the tribulations that in Great Britain had been their penalty for being the earliest representatives of their species to make their appearance in a Modern Western World. The North American industrial workers' minimum standard of living had always been fabulously high, as measured by even the highest contemporary West European standards; and any North American industrial worker who was energetic, able, and enterprising could still look forward—or at any rate still believed that he could still look forward—to finding opportunities of rising into the middle class by his own personal exertions. On this account, industrial workers in the United States mid-way through the twentieth century were perhaps still almost as much concerned to keep open their opportunities of attaining individually to a middle-class prosperity as they were to improve collectively a present state of life which they were inclined, one and all, to regard as transient. If this is a correct diagnosis of the mid-twentieth-century outlook of the industrial workers in the United States, this state of mind would manifestly be an effective insurance against any risk of a secession of the industrial proletariat in the leading Western industrial country of the age. A West European observer, however, would be moved at this point to ask himself whether, in the long run, North American conditions were not more likely in these respects to approximate to West European conditions than West European conditions were to approximate to North American.

¹ See VII. vii. 473-8.

² See V. v. 174-6.

tion, to which the Mahāyāna had never succumbed, of lending itself to the mundane purposes of a militant state; and a sterility that had been the uniform nemesis of Zoroastrianism, Imāmī Shi'ism, and Sikhism when these abortive higher religions had prostituted themselves respectively to the service of the Sasanian Empire, the Safawī Empire, and the Khalsa¹ might be expected to blight a Communism that had prostituted itself to the service of the Soviet Union² at the very moment when it had embarked on the audacious spiritual enterprise of challenging not only a post-Christian Western Civilization but a Christianity that was the tap-root of the Western and the Russian Civilization alike.

Thus, while the symptoms of schism in the Western Civilization's body social were unmistakable, the patient's prospects were still enigmatic in A.D. 1952; and we shall find ourselves arriving again at this same pair of conclusions if we look into the contemporary state of Western souls. A sense of drift, for example, could be detected on the intellectual plane in the antinomianism of the post-Modern Western historians,³ and on the economic and political planes both in a Liberal *laissez faire*⁴ and in a Marxian determinism;⁵ and any anti-Marxist who might be seeking comfort in the idea that a deterministic creed could not be a dynamic one would have been wise to recollect that Fatalism has a paradoxical power of acting as a spiritual tonic.⁶ A sense of sin that Methodism had inculcated in the eighteenth century into the hearts of a despised and rejected urban proletariat was at work in the twentieth century in the hearts of Protestant Westerners of the middle class, to judge by the vogue of the revivalist enthusiasm that was being propagated in this soil by a 'Moral Rearmament' movement.⁷ A sense of promiscuity was, of course, strongly marked in a Western Civilization that had become ubiquitous; but its most characteristic manifestations in a twentieth-century Westernizing World were not those tendencies towards pammixia and proletarianization that had loomed so large in the histories of civilizations whose geographical expansion had been an unequivocal symptom of cultural disintegration.

The notorious receptivity of empire-builders had been displayed by Modern Western representatives of the type for the most part in trivialities such as a partiality to exotic foods and beverages.⁸ It was true that the advance-guard of the West European settlers on North American ground had gone considerably farther towards adopting in its entirety the barbarian way of life of the Red Indian 'natives' with whom they had fought and traded, but these barbarized pioneers of an expanding Western Civilization had ensured their own disappearance in the act of exterminating their barbarian 'opposite numbers'. As soon as they had accomplished their murderously romantic historical mission of clearing the North American barbarians out of the way, they themselves were swiftly sucked back into the prosaic Main Street of a pullulating Middletown.⁹ The culture of this Middletown had lapsed into a conspicuous vulgarity and barbarism in the realm of Art;¹⁰ yet an observer who might

⁷ See V. v. 439.

¹⁰ See V. v. 481-2.

be inclined to see in this the token of a failure of creative power would have been wise to recollect that the vulgar Hellenic art of Gandhāra had given birth, in its day, to the etherially creative Mahayanian Buddhist art of China and Japan.¹

An expanding Western Society had found it convenient to employ the Tuscan,² French,³ and English⁴ languages as *lingue franche* at successive stages of its progressive occupation of the *Oikoumenê*; but the inevitable debasement of these languages in this rough and ready usage had not disqualified either English, French, or Tuscan for continuing to be used as a vehicle of high poetry by poets who still spoke the language as their mother tongue. Latter-day Western history could also furnish examples of syncretism in religion. Since A.D. 1688 one of the attributes of the British Crown had been a simultaneous association with two—and, from A.D. 1714 to A.D. 1837, actually with three—different denominations of a Protestant Western Christianity;⁵ and this late-seventeenth-century constitutional combination of varieties of one of two branches of the Western Society's ancestral religion, which had marked the transition from a fanatical Early Modern to a latitudinarian Late Modern chapter of Western ecclesiastical history, had been surpassed in daring by the nineteenth-century infusion of an exotic Protestant Christianity into the ancestral Hinduism of the Brahmō Samāj and into the ancestral Taoism of the T'ai'p'ing.⁶ Yet, however daring they might be, these and other syncretisms between an Occidental and an Oriental religion in Modern Western history had so far shown no sign of playing the momentous part that had been played in post-Alexandrine Hellenic history by Christianity, Mithraism, and the worships of Isis, Cybele, and Iuppiter Dolichenus.

In the life of a latter-day Western Society there were also some manifest exhibitions of Archaism and Futurism.

Archaism had displayed itself on the plane of institutions and ideas in Rousseau's cult of Primitive Human Nature⁷ and in Hitler's cult of Barbarian Blood and Soil;⁸ on the plane of visual art in a Neo-Gothic and a Neo-Colonial architecture which had been conspicuous in a pre-atomic Western urban landscape;⁹ on the plane of language and literature in attempts to revive an antique Norse and an antique Irish;¹⁰ and on the plane of religion in the nostalgia for a traditional Roman Catholic ritual that had been displayed in both Positivism and Anglo-Catholicism,¹¹ and in the nostalgia for a semi-fictional Nordic barbarian ritual that had been displayed in Hauerism.¹² Yet this Hitlerian German attempt to revive a primitive pagan past was convicted of being nothing more than a passing extravaganza when it was measured by the standard of the Meiji Japanese revival of Shintō;¹³ the preciousness of a selfconscious Anglo-Catholic and Positivist ritualism fell far short of achieving either a social or a moral effect that could be compared with the effects of the revival of traditional Roman religious observances by Augustus;¹⁴ and it is significant

that the linguistically selfconscious nineteenth-century Norwegians and Irish were descended neither from the original members of the Western Civilization nor from its barbarian proselytes, but from frustrated representatives of two abortive civilizations that had been blighted by premature encounters with a rising Roman Western Christian Civilization for which they had been no match.¹

A glance at the contemporary exhibitions of Futurism in a latter-day Western Society's life told the same tale. On the plane of political institutions, the deliberate effacement of traditional boundaries through an artificial redrawing of the administrative map, *more Cleistheneo*,² had been exemplified in the remapping of an eighteenth-century France into departments and of a twentieth-century Germany into Gaue,³ while, on the plane of the arts, there had been patent symptoms of Futurism in all provinces of a post-Modern Western World in music, dancing, painting, and sculpture.⁴ Yet, though such manifestations of Futurism were discernible, it was also manifest that their effect, so far, had been slight.

In addition to these latter-day Western evidences—at whatever value their importance was to be appraised—of schism in the Soul and schism in the Body Social, we have found,⁵ in a synoptic analysis of the rhythm of the disintegration-process, that the Western Civilization's latter-day history conformed to a pattern—a series of two paroxysms punctuated by one rally—that had been the regular rhythm of a Time of Troubles in the histories of civilizations that had run through the whole disintegration-process from breakdown to dissolution. The appearance of this sinister pattern in Western history was, in A.D. 1952, perhaps the most alarming of all current Western experiences with non-Western precedents. Yet, as we have already observed in another context,⁶ the nebulous possibility that the Western Civilization might, at this date, be in the grip of the second paroxysm of a Time of Troubles was less significant than the plain fact that it had at least not yet entered into a universal state.

The inquiry that we have now completed thus suggests that the non-Western precedents for Western experiences were inconclusive. While we have found enough evidence to make it clear that authentic symptoms of breakdown and disintegration were discernible in the life of the Western Civilization mid-way through the twentieth century of the Christian Era, an assessment of this evidence has proved not to be so easy; and we might be in danger of exaggerating the significance of the facts if we were to allow ourselves to forget that, in the life of every living society, as in the life of every living organism, a tendency towards breakdown and disintegration is constantly asserting itself, and as constantly requiring to be resisted, even when the society is in the healthiest and most vigorous burst of its growth. The pertinent question was not whether the symptoms of breakdown and disintegration were present, but whether they were serious. Was the malady grave? Was it incurable? Was it lethal? And in A.D. 1952 these were questions to which no conclusive answer could be given when they were asked with reference to

⁵ See V. vi. 312-21.

⁶ On pp. 411-12, above.

the prospects of the Western Civilization, because in A.D. 1952 the plot of this Occidental drama had not yet arrived at its denouement.

(II) UNPRECEDENTED WESTERN EXPERIENCES

In the pursuit of our inquiry into the prospects of the Western Civilization we decided to take testimony from the histories of all societies of the species, and in the preceding chapter we have called the roll of Western experiences with non-Western precedents. Our investigation would, however, be incomplete if we did not go on to consider evidence furnished by the history of the Western Civilization to which the histories of other civilizations present no parallels; and, as soon as we address ourselves to this remainder of our present undertaking, our attention will be caught and held by two commanding features in the social landscape of a latter-day Western World that have no visible counterparts in the landscapes of the other societies of the same species when, in our mind's eye, we conjure these up, side by side with the Western Society, in a synoptic view. The first of these apparently unprecedented Western experiences is the extent of the mastery that a Late Modern and post-Modern Western Man had acquired over Non-Human Nature; the second apparently distinctive Western experience is the constantly accelerating rapidity of the process of social change in the Western World in consequence of the no less constantly accelerating rapidity of Western Man's advance in his mastery over Non-Human Nature. It is true that these two at first sight seemingly unique experiences of a latter-day *Homo Occidentalis* turn out, on a closer view, to have been shared with him in some degree by all other avatars of Man in Process of Civilization, and in lesser degrees by all Mankind and perhaps even by all Life since the first epiphany of Life, human or pre-human, on the face of the planet. These differences of degree were, however, so great that they were tantamount to differences of kind, and this meant that the impression of being unique that these two latter-day Western experiences gave at first sight came nearer to the heart of the truth than the observation that both of them were actually shared by Western Man with the representatives of other species of Human Society and other forms of Terrestrial Life.

In an earlier context¹ we have noted that, since Mankind's passage from the Lower to the Upper Palaeolithic stage of a cumulative technological progress, the Human Race had been the lords of Creation on Earth in the sense that, from that time onwards, it had no longer been possible either for Inanimate Nature or for any non-human terrestrial living creature to exterminate Mankind or even to prevent them from continuing to increase their knowledge, their power, or their happiness. From that time onwards nothing on Earth, with one outstanding exception, had been capable any longer of thwarting Man's material and moral progress or of bringing him to ruin or destruction; but this one last unsubdued enemy and potential destroyer of Man was a formidable one, since he was, of course, none other than Man himself. Man's firmly established lordship over Creation had endowed him with a surplus of

¹ In VII. vii. 486.

power over and above his limited requirements for holding his own against Non-Human Nature; and it was open to him to use this surplus as he chose.

The craft of his engines hath passed his dream,
In haste to the good or the evil goal;¹

and he had turned his face so perversely towards the evil goal of being his own enemy that, ever since his acquisition of this two-edged superfluity of material power, his crux had been the spiritual problem of dealing with himself, his fellow men, and God, not the technical problem of dealing with Non-Human Nature. Man's relation to a conquered Non-Human Nature now no longer had any importance for Man in itself, since his power to hold his own against this once formidable but now defeated adversary was something that, henceforward, he could take for granted. The importance of his Technology for him now lay in the surplus of power that he was able to extract from Non-Human Nature for use either for or against God and himself; but, by reason of the metamorphosis of a technological into a spiritual problem, the importance of Technology had actually become greater than ever; for its spiritual effects for good or for evil had increased and were increasing *pari passu* with each fresh advance in technological progress.

In the light of this tragic relation between Technology and Morality since a Fall that had been coeval and identical with Life's attainment of the level of Humanity, it might look as if, after all, there were nothing new in the spiritual challenge that a latter-day Western Man was presenting to himself by his continuing technological progress in the twentieth century of the Christian Era. In previous passages of Western history, as well as in the histories of other civilizations, human affairs had not infrequently been upset by sudden great advances in Man's command over Non-Human Nature; and this previous evidence was even sufficiently copious and illuminating to warrant the tentative formulation of a 'law' to the effect that, the greater the technological triumph, the greater the risk of spiritual devastation. The Western dawn of an Atomic Age had now, however, registered the point at which the stakes in the game of human life that Man must play willy nilly *ex officio humanitatis* had been raised to a degree that had made the change tantamount to a difference in kind; for the eruption of a Late Modern Western Industrial Revolution in Great Britain, less than two hundred years since, had brought with it a fresh increase in Man's power over Non-Human Nature that dwarfed the previous sum total of Man's cumulative achievements in a field of activity in which he had been as signally victorious over Non-Human Nature as he had been signally defeated by his own nature in the things of the spirit.

An unprecedented increase in Man's material power, which had begun with the harnessing of steam, generated by coal, to the service of manufacture and locomotion, had been mounting up in one feat of technological virtuosity after another. The physical driving force at Man's com-

¹ Sophocles: *Antigone*, ll. 365-6, translated by Gilbert Murray (quoted already in V. v. 61).

mand had been multiplied by the subsequent harnessing of mineral oil to drive an internal combustion engine, and by the discovery of a 'know-how' for converting Man's older servant water-power into electricity. The consequent possibility of producing cheaply an abundance of artificial light and heat had enabled Man to make himself at home within the Arctic Circle,¹ while the progress of Tropical Medicine and the discovery of a technique for air-conditioning had enabled the children of temperate latitudes to exploit the wealth and enjoy the amenities of the Tropics without any longer incurring a prohibitive risk of finding a grave there. After the invention of the steamship, the railway train, and the motor-car had 'annihilated distance' for travellers on the land and water surface of the planet, the invention of the submarine and the aeroplane had given Man's habitat a third dimension in both depth and height. The telegraph, telephone, gramophone, radio, television, and radar had 'annihilated distance' in a fourth dimension by enabling human beings to communicate with one another instantaneously round the whole circumference of the globe without having to meet one another in the flesh. And, finally, since the last days of a Second World War, the unprecedentedly fast and fertile technological progress of the Western World in the course of the preceding six generations had been crowned by a feat that had made even the intellectually and morally blindest men and women in the living generation suddenly aware of the fateful significance of all technological progress, not only in the Western World since the outbreak of a Late Modern Western Industrial Revolution, but in the World at large since the dawn of a Late Palaeolithic Age. The discovery of a 'know-how' for tapping the titanic force of atomic energy and applying this to the destruction of human lives and works had brought home to the imagination of Mankind in the mass some inkling of a tragic lesion in the affairs of men which more than one Western man of science had already diagnosed and reported.² A geometrically progressing Technology had now armed a perpetually reborn Original Sin with a weapon potent enough to enable a sinful Mankind to annihilate itself. 'The wages of Sin is Death.'³ The fate of Hiroshima and Nagasaki had set these dread words ringing again in ears that, through a long familiarity with their sound, had long since grown deaf to their meaning.

In A.D. 1952, seven years after the detonation of an explosion that had been heard round the World, it was evident that an unprecedented human situation had now been created by the unprecedented potency to which Mankind's progressively accumulating surplus of material power had been raised, with an unparalleled rapidity, by the technological prowess of the Western Civilization in the latest chapter of its history. Man's acquisition of this degree of command over non-human forces had made it impossible for him any longer to evade the challenge of two

¹ The sudden provision of an abundance of cheap lighting in Northern Norway during the winter months of perpetual night through the generation of electricity out of the abundance of a previously unutilized local water-power was said to have been followed by a proportionately steep fall in the local rate of death by suicide.

³ Rom. vi. 23.

evils which Man himself had brought into the World in the act of providing himself with a new species of society. For some five or six thousand years ending on the 6th August, 1945, Man in Process of Civilization had been indulging in wars and class-conflicts between fractions of societies that had articulated themselves vertically into mosaics of parochial states and horizontally into layers of stratified classes. The strife generated by these fatal flaws in the structure of the civilizations had already been the death of perhaps twenty out of the twenty-one representatives of the species that had come into existence up to date. The vast and swift further technological progress that had since been made by the sole survivor was now threatening to bring destruction, not just upon one more civilization, but upon this species of Society itself and upon the species of living creature that had created it. The challenges of War and Class-Conflict had now been raised to a pitch of intensity at which the choice with which Mankind found itself confronted was the extreme choice of kill or cure. A latter-day Western Civilization's technological *tours de force* had, in fact, made War intolerable by making it manifestly suicidal,¹ and made Class-Conflict intolerable by making it apparently remediable.²

While the vast new impetus imparted by Western Man to Mankind's secular technological progress had thus precipitated a crisis in human affairs that had been pending since Primitive Man's entry into an Upper Palaeolithic Age, the correspondingly vast new acceleration of the pace of change that a Western technological revolution was now forcing upon Human Nature on every plane of activity had precipitated a crisis that had been pending since the first epiphany of Life on Earth. In a previous context³ we have seen that an acceleration which was one of the key-notes of the current phase of Western history was the latest term in a serial crescendo movement that had been gathering momentum with each fresh advance in the evolution of terrestrial living organisms; and in this perspective the technological stimulus by which this movement had been carried forward in a human milieu looked like Man's translation, into his own rational purposive terms, of some *nisus* inherent in Life itself. In the same context, however, we have also seen that in the current phase of Western history the pace had been forced to a speed that had imported a new element into the situation. For the first time in the history of Mankind, not to speak of the history of pre-human forms of Terrestrial Life, the speed had risen to a height at which a quantum of change within a single lifetime that was beyond the adaptational capacity of a single life was being demanded of all living members of a Western Society that by this time had engulfed the whole living generation of Mankind.

A killing pace was not, of course, in itself, an altogether unknown tragedy in previous human experience. Ever since the time, some five or six thousand years back, when societies that were chronologically contemporary with one another had begun to become differentiated from one another culturally by the emergence of the civilizations above the

¹ See pp. 473-560, below.

³ On p. 361, above.

² See pp. 561-641, below.

level of the primitive societies and by the distinctive individuality of the contours of each of these uprising cultural peaks, an abrupt encounter between two or more sharply diversified societies had been a perpetual possibility that had also frequently been realized as a matter of tragic historical fact. In such encounters between diverse contemporaries the weaker party was apt, as we have already observed,¹ to be confronted with the agonizing necessity of having to attempt to achieve an adaptation beyond the compass of its adaptational capacity as the only alternative choice to going under without a struggle; and, though we have not come across any instance of a civilization in its growth-phase having been broken down by a collision with a more potent alien society, we have noted a number of examples of civilizations already in disintegration receiving their *coup de grâce* from an alien hand.²

The Western Civilization, for example, had played either the murderous or the insidious aggressor's part in encounters with ten contemporary societies of its own species. It had assassinated the Mexic, Yucatec, and Andean civilizations, and had led the other seven the dance that Goethe's Mephistopheles leads Goethe's Faust.³ The new element in the situation in a Westernizing World in A.D. 1952 was not the destructive or subversive effect that was the familiar consequence of any cultural encounter, but the fact that, in an *Oikoumené* that was in process of being made into the common home of a single all-embracing society within a Western framework, the unifying Western Civilization had carried the acceleration of its own spontaneous internal change to a pitch at which it was now already victimizing itself by acting as its own Mephistopheles and was threatening to victimize itself more crudely than that by acting as its own Cortés or Pizarro. The pace of Western change had now become so fast that, even within the Western Civilization's own original Western patrimony, where this pace was being set from within and was not being forced upon the Subconscious Psyche by the pressure of any external agent, it was imposing an intolerable tax on the stamina of the best-trained native-born Western runners. *A fortiori*, this was a killing pace for that great majority of Mankind who were not native children of Hesperia's household but were alien conscripts in her immense internal proletariat.

At this critical moment in the history both of the West and of the World, when it would have been difficult in any circumstances for the Human Psyche to move fast enough and far enough along the path of psychological adaptation to a process of technological advance that was now rushing at a break-neck speed, the difficulty had been aggravated by revolutionary social and political changes that the revolutionary technological changes had brought with them.

Since the close of the fifteenth century of the Christian Era, the work of unifying the World within a Western framework had been mostly carried out by six West European countries—Portugal, Spain, Holland, France, Britain, and Belgium—and, within these countries, mainly by one class, the bourgeoisie; and, after the two Iberian pioneer countries in a Modern Western movement of world-wide Oceanic expansion had fallen out of the race, the British, French, Dutch, and Belgian middle

¹ In IX. viii. 88-629.

² See IV. iv. 76-114.

³ See II. i. 272-99.

class had been left to share between them the bulk of the profits of this gigantic Western enterprise. In drawing profits and exercising power they had gradually acquired experience and undertaken responsibilities; and, though their Western competitors and non-Western commercial customers and political subjects might complain that these middle-class North-West European organizers of a Unitary World had been awarding to themselves unduly high fees for their unsolicited managerial services, the World's history since A.D. 1914 had demonstrated by the method of experiment that these services had come to be indispensable, whatever the fair charge for them might be estimated to be, and whatever agency might have the handling of the business of performing these services on commission. It had also been demonstrated that, whatever might be History's ultimate verdict on the conduct of a Unified World's affairs by its self-appointed previous British, French, Dutch, and Belgian managers, no other candidate had so far come forward who was, as yet, equally well qualified to execute delicate and exacting tasks that must be carried out with vision as well as with efficiency if a now oecumenical Western Society was to be saved from shipwreck.

By A.D. 1914 the North-West European bourgeoisie had knit the whole habitable and traversable surface of the planet together in a network of shipping, trade, and finance of which the nodes had come to be London, Paris, Amsterdam, and Brussels, and they had also bridged the cultural gulf between the Western Civilization and its contemporaries by building overseas empires that had brought Western and non-Western populations together under common governments operated and controlled by the West European imperial Powers who had organized them. No doubt, a world order that had been founded on so narrow a basis would have had to be placed on a broader basis sooner or later as a necessary alternative to a break-up that would have been a catastrophe for all parties in an age in which Technology had come to operate on an oecumenical range; but this doubtless ultimately inevitable transfer of profits, power, and responsibility would probably have taken place gradually, over a span of several generations and perhaps even more than one century, if a Westernizing World had continued to suffer no more severely from Civilization's historic maladies of War and Class-Conflict than it had been suffering during the century that had ended in A.D. 1914. If the World had gone on living at that tolerable nineteenth-century tempo the North-West European middle class would have had time to share their profits, power, responsibilities, and experience with a continually widening circle of successively co-opted new partners without being ruined by being called upon to adapt themselves to this necessary change at an impracticably headlong gait, while the new participants in North-West European middle-class experience, responsibilities, power, and profits would have had time, for their part, to digest the experience and to accept the responsibilities as a moral obligation bound up with the taking of the profits and the assumption of the power. Unhappily the Subconscious Psyche's failure to keep pace with the accelerating speed of technological innovation had forced an anyway inevitable change to take, not the auspicious course of orderly rational evolution, but the

disastrous course of a revolution that was as uncircumspect as it was anarchic.

Between A.D. 1914 and A.D. 1945 the high tension between a conservative Psyche and a revolutionary Technology had discharged itself in two world wars in one lifetime; and this reduplicated catastrophe had 'put down the mighty from their seat and . . . exalted the humble and meek'¹ at a pace that was not less bewildering and overwhelming for suddenly exalted *novi homines*—a Bevin, a Nehru, a Truman, a Stalin—than it was for elder statesmen, proconsuls, financiers, and diplomatists who had been as suddenly deposed from a long-exercised office. In the course of little more than thirty years the North-West European middle class had had to concede a preponderance of political and economic power at home to the industrial workers, and simultaneously to hand over the whole of its previous political and economic power in its former Asiatic dominions to a native Asian *intelligentsia* whose left-handedly sincere way of flattering its European creators and employers by imitation had been to insist on taking their places as the masters in each once subject Asian people's own now emancipated national house. Within the same brief period of time a North-West European middle class that had thus been losing its predominance at home and its ascendancy in Asia had simultaneously been forfeiting its oecumenical economic and political influence to new supra-national Great Powers of an invincibly higher material calibre that had swiftly loomed up out of great open spaces where they had been able gradually to develop, unthwarted, on the fringes of an *Oikoumenê*² that since A.D. 1498 had been unified by, and till A.D. 1914 had been centred upon, a diminutive row of half a dozen nation-states along the Atlantic seaboard of Western Europe.

In A.D. 1952, when it was already possible to look back on this 'awful revolution'³ as a decisively accomplished fact, the practical question of vital moment for the future of the West and of the World was whether the new holders of power and responsibility had grown in wisdom commensurately with their growth in stature.⁴ People whose experience had been gained, and whose habits of feeling, thinking, and action had been formed, in the negative school of an opposition, in which they had been serving their apprenticeship for decades and even for generations, had now suddenly saddled themselves, or been saddled by the fiat of History, with the moral burden of onerous positive duties. A British industrial working class bred up in a century-old tradition of resisting exploitation by middle-class employers now had to 'make the country pay its way'. Indian nationalists bred up in a fifty-years-old tradition of rebelling against the rule of British imperialists now had to 'carry on the' *ci-devant* 'King-Emperor's government'. American politicians bred up in a one-century-and-three-quarters-old tradition of making it impossible for any American avatar of a British King George III to levy taxation without representation, and Russian autocrats bred up in a six-centuries-old tradi-

⁴ Luke ii. 52.

tion of making Holy Russia safe for an orthodox faith, had now 'to make the World go round' between them.

Would these rawly inexperienced new pilots succeed in keeping Mankind's battered and labouring ship off the rocks? This was the question that, in A.D. 1952, rose to the lips of a sixty-three-years-old middle-class North-West European observer who had been born into a seemingly rational and manageable world in which the feasible responsibility for keeping a world-wide Westernizing Society on an even keel had rested with his own kin and kind, and who had now lived on into an unfamiliar and disconcerting World in which his own kin and kind had become flies on a hazardously untended wheel that was spinning this way round and that way round at a venture, while two titans who alone now possessed the brawn-power to manipulate it were engaging in a quarrel over the dangerous competition between them for exercising the control. This question how a twentieth-century Westernizing World was likely to fare in the hands of its new masters is manifestly of the essence of our present inquiry into the Western Civilization's prospects. In trying to read this riddle we may manage to simplify to some degree a bafflingly complex intellectual task by giving separate consideration, first to Technology, War, and Government, and then to Technology, Class-Conflict, and Employment.

D. TECHNOLOGY, WAR, AND GOVERNMENT

(I) THE ORIGIN AND NATURE OF THE PROBLEM

THE problem with which the heirs of a Western Civilization were being confronted by the institution of War in A.D. 1952 had been set by the impact of an unprecedentedly potent latter-day Western technique on a literally world-wide Westernizing Society that was still articulated into a plurality of parochial states, since these states were still at liberty—and, because individually free, were collectively under pressure of a mutual fear and competition—to continue to go to war with one another as the penalty for being still severally sovereign and independent.

This problem was, as we have seen, by no means peculiar in itself to the Western World in the twentieth century of the Christian Era; it had likewise beset, in their day, all the civilizations that by this time were demonstrably extinct, fossilized, petrified, or moribund; but, as we have also observed, the extreme difference of degree between a latter-day Western and a previous human mastery over Non-Human Nature was tantamount to a difference in kind, because the additional 'drive' that it had put into the traditional institution of War had heightened the hazard of War for Humanity from a limited to an unlimited risk. In the situation as it was in A.D. 1952 the continuance of a possibility of War was no longer only a menace to the survival of another man-made institution, the now oecumenical Western Society. Since the invention of the atomic bomb and the incubation of further, and perhaps still more deadly, new weapons, War had also become a menace to the survival of all human beings implicated in this society—and, by the time of writing, the membership of the Western Civilization on the technological and military planes had come to include the entire living generation of the Human Race.

(II) THE SITUATION AFTER THE SECOND WORLD WAR

(a) A PROGRESSIVE CONCENTRATION OF POWER

On the morrow of the Second World War, a World that had now been unified within a Western framework found itself in the midst of a revolution generated and propelled by the double shock of two blows dealt by a Western technology that had been raised to an unprecedented degree of potency. The impact of Technology on the Human Psyche had detonated two world wars within twenty-five years of one another and had thereby reduced the number of the Great Powers in a Western system of international relations from eight to two within the thirty-one years 1914-45. The impact of Technology on Mankind's means of communication had brought these two surviving Great Powers within

point-blank range of one another round the circumference of the globe by 'annihilating distance'. The situation thus created was so formidable, as well as so novel, that it called for a closer analysis.

The deadliness of the rate of the casualties among the Great Powers during these first thirty-one years of a new bout of Western warfare was grimly evident in retrospect. It was now clear that political and military power—and, by implication, economic power as well, in an industrialized and mechanized world—were being concentrated at a headlong pace; and the effect of a now manifest tendency upon its victims' minds and feelings was the sharper inasmuch as this dominant undercurrent of international affairs had been concealed, in and after the peace-settlement following the General War of A.D. 1914–18, by a short-lived tendency in the opposite direction that, at the time, had been conspicuous¹ just because it had been superficial.

By breaking up one Great Power, the Danubian Hapsburg Monarchy, and one *ci-devant* Great Power, the Ottoman Empire, and temporarily maiming and crippling two other Great Powers, Germany and Russia, the War of A.D. 1914–18 had permitted a previously dammed-back wave of Nationalism—rampant among politically un-unified and un-liberated peoples who had been dazzled by the historic success of the classical nation-states of Modern Western Europe²—to increase, at those four stricken Powers' expense, the number of the states of a medium and a small calibre in the Western international comity. During the preceding forty-three-years-long lull (*durabat* A.D. 1871–1914) between the end of the aftermath of the Revolutionary and Napoleonic Wars and the outbreak of the First World War, the political unification of Italy and of Germany had reduced the number of the lesser states in the Western system to a minimum and had indeed temporarily removed from the map all remaining states of a medium calibre with the sole exception of Spain. In the peace-settlement of A.D. 1919–21 this medium class of states had been reintroduced on to the political map by the reconstitution of Poland and by the aspiration of Brazil to have outgrown the stature of a small state even if she might not yet be deemed to have attained the dimensions of a Great Power.³

In the constitution of the League of Nations the success of the lesser states' self-assertion during the first decade after the close of the First World War had been registered in A.D. 1922 in the raising of the number of non-permanent seats on the Council from the provisional minority figure, originally agreed in A.D. 1919, of four, as against the minimum number of five permanent seats then reserved for Great Powers,⁴ to the majority figure of six, as against four;⁵ and in A.D. 1926 the Great Powers

¹ See Toynbee, A. J.: *The World after the Peace Conference* (London 1925, Milford), pp. 24–43, especially the comparative table, on pp. 32–34, of states, below the rank of Great Powers, which were playing an active part in international affairs before and after the War of A.D. 1914–18.

² See IV. iv. 185–90.

³ See Toynbee, A. J., *op. cit.*, pp. 35–36, and Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs, 1926* (London 1928, Milford), p. 21.

⁴ See the original text of Article 4 of the Covenant of the League of Nations.

⁵ See Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs, 1926* (London 1928, Milford), pp. 10–14.

on the Council had been prevented by the minor states' obstruction from securing Germany's admission to membership in the League with a permanent seat on the Council until they had consented to pay the price of agreeing to the institution of three 'semi-permanent' seats for the benefit of Poland and other medium-sized states of her kind.¹ The Wilsonian illusion, thus created, that the comity of states was being 'democratized', had been fostered at the time by the self-restraint of the three Great Powers—France, Great Britain, and the United States—that had emerged from the First World War as temporary victors; for it had been incompatible with these Powers' principles, and not imperative for their interests, to treat the lesser states very high-handedly.

The brutal truth that had been hidden under this amiable but brittle mask had, however, been quickly exposed by the resurgence of Germany under a National-Socialist régime; and, after a criminal Power that had taken full advantage of having been let off lightly in the Paris peace-settlement of A.D. 1919–20 had paid in A.D. 1945 for her abominable crimes by being first blasted, then invaded, and finally dismembered like the Hapsburg Monarchy in A.D. 1918, it had become clear that the significant event in the First World War had been the destruction of the weakest of the Great Powers of the day, not the spawning of a litter of new minor states. The temporary erection of minor states in a political vacuum produced by the break-up or mutilation of former Great Powers, so far from militating against the concentration of power, had created an opportunity for it. The nominal 'liberation' of 'successor-states' had indeed been illusory from first to last. They had been created to be enslaved; for no other fate than enslavement could await minor states, new or old, in a world in which the concentration of power was being ordained inexorably by Technology's relentless progress.

In this world, states of anything less than the highest calibre were not any longer either economically or militarily or politically 'viable'; their presence on the map was an invitation to an aggressor, and the opportunity had been perceived by Hitler's intuitive genius and had been exploited by his criminal lust for power as a key that was to open for Germany her way to a world-wide domination. Hitler's strategy of aggression had been to equip Germany with the material resources for dominating the World by capturing the defenceless pawns that had taken the *ci-devant* Hapsburg and Romanov Empires' places on a Central and East European political chess-board; and his eventual catastrophic failure to win for a Third German Reich this Hapsburg and Romanov heritage had merely bequeathed to the Soviet Union the chance of snatching out of a slain Third Reich's dead hands, and concentrating in her own giant grasp, the whole of the Hohenzollern Empire's, as well as the Hapsburg and Romanov Empires', legacy of 'successor-states' as far west as the Elbe, Thuringia, and the Boehmerwald.

This progressive liquidation, since A.D. 1938, of the successor-states of destroyed or mutilated Great Powers in Central and Eastern Europe had indicated what the fate of all other successor-states in other regions was likely to be. The only reason why West Germany and South-West

¹ See *ibid.*, pp. 16–78.

Austria had not, by A.D. 1952, yet followed East Germany and North-East Austria into Russia's maw was that these two other fragments of a dismembered Third Reich had come meanwhile under the control of the United States and her West European allies Great Britain and France; and by this date it had become clear that the substitution of a United States protectorate for an untenable independence was the only insurance against Russian domination that promised to be effective in the long run for any state anywhere in the World.

This role, which was a new role for the United States in the Old World, was a familiar role of hers in the New World; for the substitution of a covert for an overt subjection through a process of nominal liberation was a tragi-comedy that, before being played in Central and Eastern Europe between A.D. 1918 and A.D. 1945, had been played in Latin America more than a hundred years earlier, between A.D. 1810 and A.D. 1823. From the days of the Holy Alliance to the days of the Third Reich, the Monroe Doctrine had saved the successor-states of the Spanish Empire in the Americas from falling under the domination of some other Continental European Power at the price of replacing a Spanish imperial administration by a United States political hegemony, that had been none the less effective for being exercised light-handedly, and by a no less alien economic ascendancy that had been enjoyed for a hundred years by the United Kingdom before this, too, had passed into North American hands. Since the reversal of the ratio of the relative strengths of the United States and Great Britain as a result of Great Britain's loss, and the United States' gain, in economic strength in the War of A.D. 1914-18, the underwriting of the Monroe Doctrine by British sea-power had ceased to be a necessity for the United States at the moment when it had ceased to be a possibility for the British Empire.

In a nineteenth-century Western World in which all the Great Powers except Great Britain had been situated on the European peninsula of the Eurasian Continent, the sea-power of the United Kingdom had incidentally screened the Americas in the act of screening the British Isles and the Transoceanic possessions of the British Crown against the danger of attack by any other Great Power then in existence. The temporarily favourable politico-geographical situation that had made it possible for the British Navy thus to provide strategic security for the entire English-speaking and overseas world had, however, ceased to exist when, at the turn of the nineteenth and twentieth centuries of the Christian Era, two new Great Powers—the United States herself and Japan—had arisen outside the British naval cordon round Continental Europe at the moment when, from within the cordon, British naval supremacy was being challenged by Germany; and the United Kingdom's inability, in these radically altered circumstances, to continue to give effective naval protection to the whole of the British Empire, not to speak of the United States and the Latin American republics, had been demonstrated in the course of half a century ending in A.D. 1945.

Even before the outbreak of the First World War, the challenge from Germany had constrained Great Britain to seek a reinforcement of her own naval strength—in the Pacific and the Indian Ocean by entering

into an alliance with Japan in A.D. 1902 and in European waters by making an entente with France in A.D. 1904. In the Second World War, in which both the Japanese and the Italian Navy had gone into action on the anti-British side, even the countervailing aid of the by this time immense sea-power of the United States had not enabled British sea-power to save Hong Kong, Malaya, and the Dutch Empire in Indonesia from being temporarily overrun by the Japanese at a time when the whole strength of the British Navy was having to be employed nearer home on the three-fold task of holding the Levant, screening Great Britain herself from invasion, and keeping open the western approaches to the British Isles. In other words, the British Empire's tribulations during the Second World War had proved conclusively that, on the strategic plane, the British Empire was now no longer the unitary Power that it had been so long as the sea-power of the United Kingdom had been able effectively to protect the whole of the Empire, from its frontage on the North Sea and the English Channel to its frontage on the China Seas inclusive; and this dissolution of the British Empire's former strategic unity had been discounted on the political plane in advance. A British statesmanship that had never forgotten the lesson of Great Britain's disastrous intransigence towards her North American colonies in A.D. 1775-83 had been forestalling the violent break-up that had been the Spanish, the Ottoman, and the Danubian Hapsburg Empire's fate by transforming the British Empire into a Commonwealth of fully self-governing states since A.D. 1867, 1848, 1841, or even as early as 1791 if the local landmarks in the constitutional history of Canada are taken as indicators of the progress of political devolution in the British Empire as a whole.¹

The voluntary, gradual, and pacific transformation of a once unitary empire into a free association between an ever-increasing number of fully self-governing states had been a triumph of good feeling and good sense which was perhaps almost unique in the political annals of Mankind in Process of Civilization up to date; and this political achievement reflected credit on the parties that had been willing to receive self-government in instalments, as well as on the party that had been willing to make progressive cessions of political power on its own initiative without waiting to be compelled. The creditableness of the political process in this British case could not, however, prevent the political effect of a dissolution of the British Empire by agreement from being much the same, in the stark terms of power politics, as the political effect of the break-up of the Spanish, Ottoman, and Danubian Hapsburg Empires by force. In this case, as in those, the effect had been the creation of a dangerous political vacuum which the champions of a dissolving Hapsburg Monarchy had diagnosed and deprecated when they had given it the pejorative nickname 'Balkanization', in allusion to the sequel to the previous break-up of the Ottoman Empire in Rumelia. The hard fact was that, by A.D. 1952, the sea-power of the United Kingdom

¹ A convenient list of the dates when responsible government was granted in the various British colonies with populations of West European origin will be found in Nathan, M.: *Empire Government* (London 1928, Allen & Unwin), pp. 47-48.

had ceased to be able, unaided, to protect the United Kingdom itself or what remained of its dependent empire, while the other now fully self-governing dominions of the British Crown, which had ceased to be able to count upon effective protection by the United Kingdom's Navy, had not become capable, unaided, of providing for their own security; and this meant that all continuing or former states members of the British Commonwealth, like all Continental European states west of the Soviet Union's 'iron curtain', must become protectorates of the United States as the only practicable alternative to their becoming satellites of the Soviet Union.

This was another way of saying that, in A.D. 1952, the Soviet Union and the United States found themselves confronting one another as the only two Great Powers still surviving on the face of the planet; and, in any international balance of power, two was bound, even at the best, to be an awkward number. It was true that in this current chapter of Western international history—in contrast to the situation during the chapter that had been opened in A.D. 1931 by Japan's initial act of aggression in Manchuria and had been closed in A.D. 1945 by the overthrow of both Japan and Germany—the two rival Great Powers were, both of them, economically 'sated' countries, either of which could find peaceful employment for the whole of its man-power, for many decades to come, in cultivating its own garden and developing the still untouched reserves of human and non-human resources within its own frontiers; and in this respect the international situation was less dangerous in A.D. 1952 than it had been before and during the Second World War, when Germany and Japan had been led into committing aggression by their belief that they could not continue to provide for a growing population at an acceptable standard of living within their own frontiers. By contrast, both the United States and the Soviet Union enjoyed, and admitted to enjoying, in A.D. 1952, a freedom from want that made both these surviving Great Powers immune to one of the historic motives for aggressiveness. Unfortunately, however, they did not, either of them, enjoy an equal freedom from the mutual fear that had been the other powerful motive for aggressiveness in the past; and their fear of one another was engendered and kept alive by the convergent operation of several different causes.

To begin with, the Russian and American peoples differed in *ethos*. The Russian people's habitual and characteristic temper was one of docile resignation, the American people's one of obstreperous impatience; and this difference of temper was reflected in a difference of attitude towards arbitrary government. The Russians acquiesced in this as an evil that some six hundred years of experience had schooled them to regard as inevitable, whereas the Americans' experience of successfully revolting against arbitrary government by ministers of a British King George III and successfully preventing any domestic recrudescence of arbitrary government during the first century and three quarters of the history of the United States had led them to think of arbitrary government as an evil which any people could banish if it had the will. In consequence, the Americans—including a middle-class-

minded American industrial working class—saw their *summum bonum* in a liberty that they equated with equality, whereas a Russian Communist dominant minority saw their *summum bonum* in an equality that they equated with liberty. These temperamental and doctrinal differences made it difficult for the two peoples to understand, and therefore difficult for them to trust, one another; and this inevitable mutual distrust bred a no-less-inevitable mutual fear in the hearts of the two strong men armed, now that the arena in which they menaced one another had been transformed out of all recognition by the unprecedentedly rapid and far-reaching recent progress of Technology in Western hands.

(b) A METAMORPHOSIS OF THE *OIKOUMENÊ*

By the middle of the twentieth century of the Christian Era the progress of Technology had made a once wide world shrivel to dimensions so diminutive as to make it henceforth impossible for two gladiators to take their stand in this arena without finding themselves within point-blank range of one another—and this, *mirabile dictu*, simultaneously from the rear as well as from the front, since, in the act of diminishing the size of Mankind's habitat, the *Oikoumenê*, in terms of its conductivity for human purposes, Technology had also transformed the *Oikoumenê*'s shape.

The unprecedented vulnerability of the position of even the relatively least vulnerable Great Power in the World of A.D. 1952 was, indeed, a consequence of a recent revolutionary change in the strategico-political map. Within living memory, Man's World, in the sense of the habitable and traversable surface of the planet of which Man was a denizen, had at last become round in fact as well as in theory—or, if not yet fully round, at least already more than hemispherical.

The theoretical knowledge that the Earth was a globe and not a disk had, of course, been inherited by the Western Civilization from its Hellenic predecessor; and this theoretical globularity had been confirmed by an empirical demonstration when, in the course of Western Man's conquest of the Ocean at the opening of the Modern Age of Western history, Magellan's squadron, setting sail westward from Seville in A.D. 1519, had encountered in the Moluccas in A.D. 1521 Portuguese compatriots of its late commander's who had arrived there by setting sail eastward from Portugal, and when the *Vittoria* had clinched this proof by coming home to port in Seville, and thus completing the circumnavigation of the globe, in A.D. 1522. Yet even this empirical demonstration had been barren of any immediate appreciable practical consequences.

So long as a Modern Western World's footholds on the shores of the Pacific had remained under the rule of Spain, a mercantile community at Seville that had been determined to retain a monopoly of the trade between the Spanish Empire overseas and the metropolitan country had succeeded in confining the annual trade across the Pacific Ocean to a single 'round trip' in which a galleon (usually accompanied by a tender) from Manila had brought a cargo of Chinese wares to the port of

Acapulco on the Pacific coast of Mexico.¹ It had been only in the course of the nineteenth century that this one sixteenth-century thread of Trans-Pacific maritime commercial traffic had been multiplied in consequence of the intervention of other Western Powers. From the eighteen-forties onwards, the Western World's frontage on the American shores of the Pacific had been extended northwards as a result of the overland expansion of both the United States and Canada from coast to coast. The Mexican port of Acapulco had been reinforced by San Francisco, Portland, Seattle, and Vancouver, while, on the East Asian shores of the Ocean, the Spanish port of Manila, the Portuguese settlement at Macao, and the Dutch commercial establishment on Deshima² had been eclipsed by Hong Kong, Shanghai, Tientsin, Nagasaki, Yokohama, and Dairen. Yet, even when the one tenuous thread, linking Manila with the Spanish dominions in the Americas, to which the Modern Western maritime traffic across the Pacific had been confined for the first three hundred years, had thus been transformed, during the nineteenth century, into a multiple skein, the *Oikoumenê* had still retained, for practical purposes, the flat and finite shape that it had worn since the days of Ptolemy, Eratosthenes, and Hecataeus, and indeed since the pre-Hellenic dawn of Civilization.

In the Old World, all civilizations of all generations up to date had risen and fallen within a festoon-shaped zone that had been slung like a hammock between a north-eastern peg in Eastern Asia slightly to the north of the 45th parallel of northern latitude and a north-western peg in Western Europe slightly to the north of the 60th parallel, with the festoon's pendulous mid-point brushing the Equator at the Straits of Malacca and sagging below it in Java. The divers sections of this elongated home of the civilizations of the Old World had communicated with one another through two socially and culturally conductive media—a waterless inland sea, consisting of a chain of steppes and deserts extending from Eastern Mongolia to the Western Sudan³ via the Shā-miyah and the Desert of Sinai, and a chain of coastal and land-locked waters extending from the Western Pacific to the Eastern Atlantic via the Straits of Malacca, the portage linking the heads of the Persian Gulf and Red Sea with the eastern extremity of the Mediterranean, and the Straits of Gibraltar—and this pristine shape of the *Oikoumenê* had not been changed when the western terminal of the longitudinal water-route had been pushed westward, across the relatively narrow waters of the Atlantic, from the west coast of the Continent to the two large off-shore islands of North America and South America, or when the portage previously interrupting the continuity of the voyage between the Continent's Atlantic and Pacific coasts had been circumvented in A.D. 1498 by da Gama and breached in A.D. 1869 by de Lesseps. At the turn of the nineteenth and twentieth centuries of the Christian Era an *Oikoumenê* whose eastern selvaie had been extended southward from the east coast

¹ A.D. 1592 was the date at which the eastern terminal of the Spanish annual Trans-Pacific voyage had been transferred to Acapulco from Callao. Officially the traffic had been limited to *per annum*. In practice there seems to have been a good deal of illicit traffic after, as well as before, this date.

² See II. ii. 232-3.

³ See I. i. 64 and III. iii. 7-8.

of Asia to Australasia, and its western selvage westward from the west coasts of Europe and Africa to the west coasts of North and South America, had been still, in effect, just as flat and as finite as ever. It had merely been tied to the circumference of the globe, as if it had been an oblong strip of cloth, by a skein of threads attaching its eastern and western selvages to one another across the breadth of the Pacific; and, even when these threads had been drawn tight enough to convert the oblong strip into a band in the shape of an armlet by bringing the two selvages together, a tell-tale suture had remained visible as an International Date-Line intersecting the Pacific Ocean along a *tracée* which followed, with some local variations, the 180th meridian of longitude.

The establishment of this International Date-Line in A.D. 1884¹ had borne witness to two contemporary facts of human geography. On the one hand a circum-global maritime traffic-belt had now come to be sufficiently frequented to demand a global adjustment between the now contiguous extremities of a longitudinal series of regionally differentiated time-zones that could not extend in a continuous chain round the entire circumference of the globe without there being a chronometrical discrepancy, of the time-length of twenty-four hours, between the respective timings of the first and the last zone in the series at the line along which these two extremities now adjoined one another. On the other hand the Pacific Ocean had continued still to be decidedly the least-frequented section of a maritime traffic-belt that had come to encircle the globe by expanding eastward and westward simultaneously from a base-line along the Atlantic coast of Western Europe; and for this reason the heart of the Pacific had proved to be the least inconvenient locus on the traversable face of the globe for a conventional line at which west-bound travellers would add to, and east-bound travellers subtract from, their time-reckoning the twenty-four hours that, at some line or other, must be added or subtracted, according to the direction of the voyage, in order to cancel an inevitable twenty-four hours' discrepancy between necessarily contiguous extremities of a circum-global belt of differential time-zones.

Meanwhile, an *Oikoumené* that had become round on the explorational plane in A.D. 1522, and on the chronometrical plane in A.D. 1884, had remained flat and finite on the strategico-political plane till A.D. 1941; for neither the passage of the Pacific on a voyage of exploration nor even the subsequent establishment of regularly frequented Transpacific traffic-lanes for merchant-ships had availed to reduce the Pacific to the dimensions of a basin in which navies based on opposite sides of its rim could manage to meet and fight. The turn of the nineteenth and twentieth centuries had seen this great Pacific gulf, breaking the continuity of the strategic map of a Westernizing World, still fixed—to all appearance as firmly as ever—in the locus of the International Date-Line; and a tacit assumption that the gulf not only was, but also would remain, an impassable one had been the common presupposition, on a fundamental point of fact, underlying the agreements reached at the Washington

¹ At the International Meridian Conference held in A.D. 1884 at Washington, D.C.

482 PROSPECTS OF THE WESTERN CIVILIZATION

Naval Conference of A.D. 1921-2 between the Western naval Powers of the one part and Japan of the other.¹

The basis of these agreements had been a reciprocal undertaking,² as between the United States, the British Empire, and Japan, to maintain the *status quo* with regard to fortifications and naval bases in certain specified territories and possessions of theirs in the Pacific area; for the effect of this reciprocal self-denying ordinance had been to insure Japan against the risk of seeing any potentially hostile foreign naval bases constructed within a closer range of her own home bases than the range of Pearl Harbour and Singapore; under the technical conditions of the moment, this provision had assured to the Japanese Navy the ability to maintain an unchallengeable regional supremacy in the Western Pacific; and, in return for the English-speaking naval Powers' consent to her thus preserving the security of her home territory through the retention of her command over the surrounding seas, Japan, for her part, had been willing to make a pair of counter-concessions without which the English-speaking Powers would not have been willing to make their own crucial concession to her.

In the first place, Japan had resigned herself to remaining markedly inferior to her two English-speaking competitors in absolute naval strength by agreeing³ to maxima in the ratio of 525,000 tons each for them, as against 315,000 tons for herself, as the figures for the replacement of capital ship tonnage. In the second place, she had bound herself not to abuse her now virtually guaranteed naval supremacy in the Western Pacific by misusing it for the purpose of committing aggression either against the now defenceless West Pacific possessions of the English-speaking naval Powers (for instance, the Philippines and Hong Kong) or against a likewise defenceless China. Japan had entered into an agreement with the United States, the British Empire, and France in which the four parties had undertaken to respect one another's rights in relation to their insular possessions and dominions in the region of the Pacific Ocean,⁴ and into an agreement with the same three parties, together with Belgium, Italy, the Netherlands, Portugal, and China, to respect China's sovereignty, independence, and territorial and administrative integrity and to refrain from taking advantage of anarchic conditions in China in order to take action there inimical to the security of the other contracting parties or damaging to the rights of their subjects or citizens.⁵

Twenty years after the date of the Washington Naval Conference the same assumption that the Pacific Ocean was still a strategically impassable gulf had nerved the Japanese Government to launch an attack on possessions of the United States, the British Commonwealth, and the

Netherlands in the Pacific; but this audacious Japanese act of aggression had proved in the event to have been suicidal because the underlying assumption had proved, this time, no longer to hold good.

By A.D. 1941 the Japanese naval authorities must have come to believe in the possibility of the United States Navy's being able, from a base in Hawaii, at least to threaten the eastern flank of a Japanese advance southward in the Western Pacific; for there can be no other explanation of their surprise attack on the 7th December, 1941, upon the United States Pacific Fleet at Pearl Harbour. Their failure, however, to follow up their sensational success in this initial operation by attempting to occupy the Hawaiian Islands and to proceed thence to an attack upon the Pacific coast of the United States and Canada is presumptive evidence of an abiding conviction in Japanese minds that it would still be beyond the Japanese Navy's, and therefore likewise beyond the United States Navy's, power to conduct sustained naval operations on the grand scale across the breadth of the Pacific. It can never have entered into Japanese calculations, when the Japanese Government were taking their fateful decision to challenge the United States' sea-power, that the United States Navy would be able within less than four years to bring Japan to her knees by succeeding, as it did in A.D. 1942-5, in solving the unprecedentedly complex and difficult logistical problem of bringing a crushingly superior striking-power to bear upon Japan in a West Pacific theatre of naval operations that was more than 3,000 miles distant from Pearl Harbour and more than 4,500 miles distant from San Francisco.¹ Admiral Nimitz's achievement in dealing Japan a knock-out blow across the Pacific in A.D. 1945 was, indeed, as epoch-making an event in the history of the West and of the World as Magellan's achievement of making his way across the Pacific to the Philippines in A.D. 1521. The American seaman was, in effect, translating on to the far more exacting strategic plane the feat performed by his Portuguese forerunner on the relatively facile explorational plane 424 years earlier.

The capitulation of Japan on the 15th August, 1945, under the Trans-Pacific pressure of United States sea-power signified the consummation of the revolutionary metamorphosis of a flat and finite *Oikoumenê* into a round one. After having been transformed from the shape of a card into the shape of an armlet when in A.D. 1884 its two selvages had been sewn together in a suture along the International Date-Line, the *Oikoumenê* had now been transformed again by the conversion of a sewn-up armlet into a welded ring; and this saturnine steel ring of unbroken strategic conductivity that had thus been clamped round the circumference of the globe in A.D. 1941-5 was threatening in A.D. 1952 to put the *Oikoumenê* through yet another metamorphosis by expanding into the shape of a great helm pulled down over the face of the globe from the North Pole to the southern edge of the Southern Temperate Zone.

In A.D. 1952 the problem of making direct flights, at least for warlike purposes, across the Arctic Circle was reported to be on the way to being solved, and this approaching fresh triumph of Western technology

¹ The distance to Yokohama was 3,445 miles from Hawaii and 4,750 miles from San Francisco.

would have the effect of putting the United States and the Soviet Union in jeopardy from one another on no less than three out of the four quarters of the compass. As a consequence of the latitudinal encirclement of the globe by the *Oikoumenê* through the United States Navy's strategic conquest of the Pacific in A.D. 1942-5, the two surviving Great Powers were already both in the same plight of simultaneously encircling and being encircled by one another—colliding, as they now did, on a front or rear in Eastern Asia, as well as on a rear or front in Europe.¹ The approaching conquest of the Arctic by the aeroplane was threatening soon to make the strategic position of both Powers even more precarious by now exposing both the United States' and the Soviet Union's northern flank to the new danger of trans-polar attack by air;² and, if this menace were to materialize, either Power would find itself in the desperate situation of having to provide concurrently for the defence of three fronts, each of which would be in danger of being turned from one flank as well as from the rear. Thus, in a now global *Oikoumenê* at the opening of the second half of the twentieth century of the Christian Era, either of the two still standing gladiators was in a posture to inflict upon, and to have inflicted upon him by, his adversary the shattering experience that once, at the crisis of the second paroxysm of an Hellenic Time of Troubles, had been inflicted upon the Romans by Hannibal and his brethren,

ad configendum venientibus undique Poenis
omnia cum belli trepido concussa tumultu
horrida contremuere sub altis aetheris oris
in dubioque fuere utrorum ad regna cadendum
omnibus humanis esset terrâque marique.³

Nor was this the end of a twentieth-century transformation-scene; for, in the act of enveloping the face of the globe, the *Oikoumenê* was contracting in scale, as measured by the speed of human means of communication, far faster than it was expanding in area, as measured by its extension over the physical surface of the planet. At the instant at which the *Oikoumenê* was assuming, on the strategic plane, the shape of a thirteenth-century Western helmet, this great helm was shrinking to the

¹ When the news of the Japanese attack on the United States fleet in Pearl Harbour reached England, an American visitor remarked to an English colleague of the present writer's, with whom he was discussing the news: 'It is all very well for you here in England to take this news so calmly! You can afford to, I suppose, considering that, in England, you are six thousand miles away from the front'. Forgetting, in the excitement of the moment, that the World had now become round and boundless, instead of being still flat and finite, this American commentator had consequently forgotten for the moment that a Britain which was six thousand miles and more to the east of the Japanese fleet's and air force's Pacific theatre of operations against Pearl Harbour was only twenty miles to the west of the German Luftwaffe's Continental bases of operations against Britain herself.

² The possibility that the ardent advance of Western Science might soon be going to set the North Pole on fire seems to have been overlooked by Senator Dandurand of Canada when, in A.D. 1924, in a debate on the draft Geneva Protocol for the Pacific Settlement of International Disputes, he had the hardihood to say about his native country: 'We live in a fire-proof house, far from inflammable materials. A vast ocean separates us from Europe.' In A.D. 1952 it was manifest that, as soon as the Arctic Circle became traversable by military aircraft, Canada's strategico-political situation would become much like what Belgium's had been in A.D. 1914 and in A.D. 1940.

³ Lucretius: *De Rerum Naturâ*, Book III, ll. 833-7.

diminutive size of a thimble; and the strategic consequence of the coming reduction of 'the great open spaces' of Man's once immense terrestrial habitat to the dimensions of a Lilliput had already been visible to the mind's eye of a prophetically imaginative Victorian English mathematician.

' "What is the smallest *world* you would care to inhabit?" . . .

' "You don't mean to say you have been trying experiments in *that* direction!" I said.

' "Well, not *experiments* exactly. We do not profess to *construct* planets. But a scientific friend of mine, who has made several balloon-voyages, assures me he has visited a planet so small that he could walk right round it in twenty minutes! There had been a great battle, just before his visit, which had ended rather oddly: the vanquished army ran away at full speed, and in a very few minutes found themselves face-to-face with the victorious army, who were marching home again, and who were so frightened at finding themselves between *two* armies that they surrendered at once!" ' 1

At a date no more than half way through the twentieth century, current Western improvements in the technique of overland transport had not yet arrived at such a perilous pitch of efficiency as to have made it likely that a vanquished North Korean Army, if it had been thrown out of North Korea in a north-westerly direction by a victorious United Nations Army in A.D. 1952, would have cannoned into a dumbfounded American Army in Bavaria. The technique of maritime transport had, on the other hand, already been brought to a point at which a United Nations Army, if it were to be dislodged or withdrawn from South Korea in A.D. 1952, might be ferried round the globe in a trice to confront a Russian Army on the Elbe; and the contemporary progress in the technique of aerial transport had already left the utmost achievements of maritime and overland transport far behind. In A.D. 1952 there was talk of aeroplanes which would be able to circumnavigate the Equator without having to break their flight in order to refuel, and which, when travelling from east to west, would be able to arrive before they had started by flying faster than the speed of the planet's eastward rotation round its axis; and presumably a single mechanical dragon of the kind could be freighted with bombs lethal enough to do execution on the appalling scale contemplated in the Book of the Revelation of Saint John the Divine. An *Oikoumené* which had been so rapidly coalescing and contracting had, in fact, no less rapidly been transforming itself from a common home into a common abattoir for the Human Race.

Πάντες τῷ θανάτῳ τηρούμεθα καὶ τρεφόμεσθα,
ὡς ἀγέλη χοίρων σφαζομένων ἀλόγως.²

In contemplating the straits to which the Human Race had thus brought itself in the twentieth century of the Christian Era through the 'annihilation of distance' by a Western Civilization's prowess in Technology, an historian would recollect that this was not the first instance of an abrupt change of scale in the histories of the civilizations. In Western history itself, for example, there had been a previous change of the kind

1 Lewis Carroll: *Sylvie and Bruno Concluded* (London 1889, Macmillan), pp. 169-70.

2 Palladas of Alexandria in the *Anthologia Palatina*, Book X, No. 85.

some four hundred years back, when the old city-states of Italy and Flanders had been dwarfed by the sudden rise of nation-states along the Atlantic seaboard of Western Europe, and when these nation-states had suddenly extended Western Christendom's horizon by mastering the Ocean. There had been a corresponding dual change in Hellenic history after Alexander the Great's passage of the Dardanelles in 334 B.C., when the Hellenic World's horizon had been rapidly extended first eastward to India and then westward to the eastern shores of the Atlantic, while simultaneously the old Hellenic city-states had been dwarfed by new multi-municipal polities on the scale of the Seleucid and the Roman commonwealths.¹ The same pair of simultaneous and associated sudden changes of scale can be discerned in Sinic history at the time of the outbreak of the post-Confucian paroxysm of a Sinic Time of Troubles. From an historical standpoint the difference between these earlier instances of an abrupt change of scale in the histories of other civilizations and the current instance in Western history was one of degree; but this difference of degree was so great—whether measured in terms of Time or of Space or of Force—as to be tantamount, in practice, to a difference in kind.

In its current act of transforming itself by simultaneously coalescing and shrivelling, the *Oikoumenê* had reduced its strategico-political structure to an unprecedentedly stark simplicity. In A.D. 1952 there was, for practical purposes, only one surviving ocean, the Pacific; only one surviving continent, the Old World; only one surviving mediterranean sea, the Atlantic; only one surviving pair of islands, the Americas; and only a couple of surviving Great Powers, the Soviet Union and the United States. The 'heartland'² of the Continent and the more northerly of the two islands were the respective seats of the two Powers' metropolitan territories; the remainder of the habitable and traversable surface of the globe was a no-man's-land between the homelands of these two gladiators who were the only two still on their feet in a Western arena that had now become world-wide; and the comparative success or failure of the Soviet Union and the United States in a competition for gaining control over the human and non-human resources of the intervening no-man's-land seemed likely to be the decisive factor in determining the side to which the scales of an oecumenical Balance of Power would eventually incline. The circum-global range of this fateful no-man's-land on the strategico-political map of the World in A.D. 1952 was as significant a feature in the current situation as it was an unprecedented one.

In an earlier context³ we have come across 'laws', operative in the play of the Balance of Power, that can be seen uniformly asserting themselves in divers episodes of history. In any system of international relations governed by the Balance of Power, it had been common form for the states at the centre to be pigmies by comparison with the relatively gigantic size of the states on the periphery, and for the central area, tenanted by the pigmy states, to be the arena into which the surrounding

¹ See IV. iv. 308-13.

² For this illuminating conception, see Mackinder, Sir H. J.: *Democratic Ideals and Reality* (London 1919, Constable), reissued in 1942 (New York 1942, Holt).

³ In III. iii. 299-306 and 311-12.

giants descended to meet and do battle with one another. Since the particular constellation of states constituting a particular balance of power had usually been brought into existence by one of those abrupt changes of scale that we have just been calling to mind, the pigmies of today were apt to be the giants of yesterday, and the arena of today, in which today's contending giants were doing their worst to ruin the civilization that was their common mother, was apt to be yesterday's nursery-garden, in which the civilization of today had been brought up as a seedling before being bedded out farther afield.¹

For example, the plain traversed by the Lower Yellow River, which in a post-Confucian Age of Sinic history was the principal battlefield of surrounding Great Powers that had arisen on the periphery of an expanding Sinic World, had previously been the domicile of the Chóu Dynasty and of a preceding Shang Dynasty's surviving successor-states, which in an earlier age had been the Great Powers of the Sinic World and the seed-beds of the culture that had come to prevail throughout the Sinic World in the subsequent Age of the peripheral Contending States. In Hellenic history corresponding roles were played by Continental European Greece and Sicily, and in Western history by Northern Italy and Flanders. Continental European Greece and Sicily, which in the third and second centuries B.C. were the battlefields of post-Alexandrine Hellenic Powers of the calibre of Egypt, Macedon, Carthage, Rome, and the Seleucid Monarchy, had been the domiciles of city-states that had been the Great Powers of a pre-Alexandrine Hellenic World and the seed-beds of an expanded Hellenic Civilization's post-Alexandrine phase of culture. Northern Italy, which from A.D. 1494 to A.D. 1866 was one of the two principal battlefields of the Great Powers of the Modern Age of Western history, and Flanders, which was their other principal battlefield down to A.D. 1918, had in a preceding constellation of forces been the domiciles of city-states that had been the Great Powers of a Medieval Western city-state cosmos and the seed-beds of the Western Civilization's Modern phase of culture.

It will be seen that these examples of *peripeteia*—the reversal of roles—in the play of the Balance of Power conform to a uniform pattern; and in Western history, by the time of writing, this pattern of events had repeated itself. In a twentieth-century Western World the nation-states that had been the Great Powers in the Modern chapter of Western history had been overtaken in their turn, since the transition to a post-Modern chapter, by the *peripeteia* which they themselves had inflicted once upon a time, at the preceding transition to the Modern chapter of Western history from a Medieval chapter, upon the city-states that had been the Western World's Great Powers in a foregoing Medieval Age. Since the onset of the series of world wars that had opened in A.D. 1914, France, Germany, Spain,² and Britain,³ as well as Italy and Belgium,

¹ See I. i. 19, for the performance of this part by Northern Italy in a Medieval overture to a Modern chapter of Western history. See further II. ii. 263, and the passages in III. iii, cited on p. 486, n. 3.

² In the Civil War of A.D. 1936-9, which, under the guise of being a domestic conflict, had been a local prelude to the international war of A.D. 1939-45.

³ In the attacks from the air to which she had been subject from A.D. 1940 to A.D. 1945.

had been suffering the ill-treatment that Lombardy and Flanders had suffered at French, Spanish, Austrian, Prussian, and British hands during the three war-and-peace cycles that had rolled over a Modern Western World in successive waves of calamity from A.D. 1494 to A.D. 1914.

Since A.D. 1914 the whole of the European nursery-garden of a Western culture that was now radiating into the whole of the rest of the *Oikoumenê* had become the Lombardy and Flanders of a literally world-wide constellation of forces in which the only surviving Great Powers were two states that were both non-European in their location and supra-national in their calibre; and this fate—physically and psychologically devastating though it was bound to be for the French and English and their like, now that their turn had come to suffer it—was nothing out of the ordinary in the sense that it was no exception to a ‘law’ of History exemplified in a number of earlier cases. The extraordinary feature in the strategico-military situation of a Westernizing World in A.D. 1952 was not that the European nursery-garden of a post-Modern Western culture had become the battlefield of a post-Modern Westernizing World’s supra-national Great Powers; what was novel and anomalous was that, instead of being confined to the locality where its location was to be looked for in the light of all the historical precedents, the battlefield of a Westernizing World which had become literally world-wide had expanded—far beyond the limits of the Western Civilization’s European patrimony—to embrace all the domains of all the civilizations that had risen and fallen up to date.

In the Old World the no-man’s-land between the Soviet Union and the United States included the whole of the festoon-shaped zone extending from the Japanese Archipelago through Java to the British Isles that had contained the habitats of all civilizations originating in the Old World until the propagation of the Orthodox Christian Civilization into Russia at the close of the tenth century of the Christian Era and the propagation of the Western Civilization into the Americas at the close of the fifteenth century; and this globe-encompassing no-man’s-land between two oecumenical Great Powers also embraced the habitats of the pre-Columbian civilizations of the New World in North America south-west of the Rio Grande and in a western strip of South America extending from Colombia to Bolivia. This conversion of all the nurseries of all the civilizations that had risen and fallen up to date into a common arena for a solitary pair of surviving Great Powers was an event that was, not merely unprecedented, but portentous. It seemed to signify that the latter-day expansion of the Western Civilization had been unique in two respects. Besides giving the *Oikoumenê* a spherical shape instead of a crescent shape in the act of expanding in the Space-dimension over the whole habitable and traversable face of the planet, a post-Modern Western Civilization had apparently been expanding in the Time-dimension as well by gathering up into its own heritage all the heritages of all the previous civilizations. All the eggs that all the representatives of this species of society had ever laid were thus now in the Western Civilization’s basket, and this novel and hazardous concentration,

in one target-area, of all the cultural treasures that Mankind had accumulated during the past five or six thousand years might be taken to indicate that the second half of the twentieth century of the Christian Era was to see the history, not only of the Western Civilization, but of Civilization itself, arrive at a crisis that might prove to be its climacteric.

In an historically as well as geographically unified *Oikoumenê*, it looked as if a competition for world-power between the Soviet Union and the United States might be decided in the long run by the suffrages of those three-quarters of the living generation of Mankind who, five or six thousand years after the dawn of Civilization, were still living in the Neolithic Age on the material plane of life, but who, within living memory, had begun to become aware that a higher material standard, opening up the possibility of a higher spiritual standard as well, had been demonstrated by the achievements of an industrialized Western Society to be attainable, under a latter-day Western technological dispensation, by a wider circle than the tiny minority which had monopolized the fruits of Civilization in all societies that had entered on the path of Civilization previously. In exercising a choice, now open to it, between an American and a Russian way of life, this hitherto submerged majority might be expected to choose whichever way of the two appeared in its eyes to promise better to satisfy this awakening majority's revolutionary aspiration to share in a hitherto dominant minority's traditional privileges; and the way of life for which the majority eventually opted on this criterion was likely to prevail throughout the *Oikoumenê*, as the progressive spread of a latter-day Western technological 'know-how' among Westernizing non-Western populations gradually enabled these to make their superiority in numbers tell in the conduct of Mankind's now common affairs.¹

Yet, although the last word might lie with a hitherto submerged non-Western majority of Mankind, it nevertheless seemed probable that in the short run the decisive weight in the scales of a Russo-American balance would prove to be, not those three-quarters of the World's total present population, but that one-quarter of the World's total present industrial war-potential that in A.D. 1952 was still located in the Western Society's patrimony in Western Europe; for, in undergoing her melancholy metamorphosis from being the nursery-garden of a post-Modern Western culture to being one sector of a Westernizing World's battlefield, Western Europe had been losing her security, prosperity, and happiness without losing her economic, political, or military importance. In this circum-global battlefield the West European sector was a crucial one because it was the Insular Power's Continental bridgehead, and because, if this bridgehead on the tip of a Eurasian Continent's European Peninsula were to fall into the hands of the Continental Power domiciled in the Continent's 'heartland', the proportion between the respective shares of the World's total current industrial war-potential at the command of the two surviving rival Great Powers would be changed at a stroke from a present ratio of three to one in favour of the United

¹ The temper generated by militarization in the non-Western peasantry of a Westernizing *Oikoumenê* is examined on pp. 503-16, below.

States¹ to an approximate equality; and, although, to begin with, that half of the World's total industrial war-potential that in A.D. 1952 was located within the frontiers of the United States might be expected to count for more than the other half because it would be less difficult to organize and to manipulate as an organic unity, it was also to be expected that this organizational advantage on the side of the United States would be outweighed, as time went on, by an increasingly effective mobilization, under a Russian single command, of the resources of a Eurafasian Continent whose aggregate resources, human as well as non-human, would doubtless prove far to exceed the aggregate resources of the American pair of islands.

(c) A TRANSMIGRATION OF THE MARTIAL SPIRIT

The Crescendo and Diminuendo of Militarism in Western Europe

The situation in which a Westernizing World on the morrow of a Second World War thus found itself on the strategico-political plane had its counterpart on the psychological plane; and, since the progress of Technology had no power to diminish the sway of feelings over the course of human affairs, but only power to put physical 'drive' into human action, our survey would remain incomplete if we did not take account of the spiritual, as well as the material, forces in the field. The effect of the current rapid increase in Mankind's material power, and of the recently consummated polarization of this power through its concentration at two points, and two only, on the face of a now global *Oikoumené*, would depend on the feelings and calculations of the divers actors in a drama in which the action had become unprecedentedly high-powered without having ceased to be familiarly human. In a mid-twentieth-century Westernizing Society, the choices between Peace and War and between Parochialism and Oecumenicalism would be decided, not by a blindly mechanical play of non-human forces, but by the hopes, fears, recollections, and expectations of men and women domiciled in divers sections of an embryonic World Community.

In this psychological situation one crucial point was the temper of the people of Western Europe, since this *ci-devant* metropolitan area of a Westernizing World still contained, as we have noticed,² a large enough proportion of the World's total current industrial war-potential to determine the inclination of the Balance of Power as between the United States and the Soviet Union. In A.D. 1952 a Western Europe that had been in a perpetual ferment of aggressiveness, with the wide world for its arena, during more than four centuries ending in the catastrophe of A.D. 1914-18, was belatedly making involuntary psychological amends to its former victims by displaying markedly less martial spirit than any other region in the *Oikoumené* of the day. After having at last converted even the Chinese, by the example of her own aggressiveness at their expense in the nineteenth century of the Christian Era, from a distaste for Militarism which had been ingrained in the Sinic tradition since

¹ This current superiority of the United States over the Soviet Union in the amount of industrial war-potential at its command is taken into account on pp. 529-30 and 531, below.

² On p. 489, above.

221 B.C., Western Europe mid-way through the twentieth century of the Christian Era had lost her own stomach for a warlike temper which she had thus perversely re-evoked in Chinese hearts; and this revolutionary psychological change in Western Europe marked the turn of a local tide that had been flowing, save for one pause in the eighteenth century, since the opening of the Modern chapter of Western history.

When, at the turn of the fifteenth and sixteenth centuries, the North Italian field of a Late Medieval Western Balance of Power between city-states had suddenly expanded to embrace the whole European domain of Western Christendom, the nation-states that were now replacing the city-states as the Great Powers in a larger constellation of forces had still followed the example of their Milanese, Venetian, and Florentine predecessors in fighting their battles mainly with mercenary troops—and these in numbers that were relatively small by comparison with the contemporary Western World's total stock of potential 'cannon-fodder'. In this Early Modern Western World the only peoples yet broken in to military service *en masse* were the seafaring populations of Venice and Genoa who furnished the man-power required for rowing their war-galleys.¹ In most of the Transmarine and Transalpine West European countries the only class yet militarized was a rural aristocracy that furnished a national heavy cavalry.

In sixteenth-century France, for instance, poverty conspired with martial spirit to send the younger sons of the nobility into the *gendarmerie*.² On the other hand the younger sons of a French peasantry that was able to make a living from agriculture found no need and felt no inclination to seek service in a national infantry;³ the only French province that produced a native infantry in the sixteenth century was Gascony;⁴ and in this age the French Government did not persevere in its discouraging attempts to build up a native infantry on a nationwide scale,⁵ because it was rich enough to hire a Swiss infantry which had established its ascendancy over the heavy cavalry of a Medieval Western Christendom since the eighth decade of the fifteenth century⁶ and which had been constrained by poverty to raise its military proficiency to a professional pitch of excellence at which it could sell itself at a high price for mercenary service abroad.⁷ Taking a cue from the Venetian Government,⁸ the French Government in the sixteenth century recruited its light cavalry from mercenary Albanian 'stradioti';⁹ and, for the reinforcement of armies operating in the Italian arena of Modern Western warfare, France could compete with other belligerents, non-Italian or Italian, for the services of the professional forces of the Italian principalities of Mantua, Ferrara, and Urbino,¹⁰ which were pioneers in the state trading enterprise—afterwards taken over by German principalities catering for a wider market—of maintaining standing

armies as profit-earning establishments to be hired at auction to the highest bidder.¹

The Spanish light cavalry (*ginetes*),² French heavy cavalry (*gendarmérie*), and Gascon infantry were thus the only land-troops of any account in the Western World at the opening of the series of Modern and post-Modern Western war-and-peace cycles that sought service with their own national governments; and they too, like their Swiss contemporaries who sold their services abroad, were moved by mercenary motives as well as by a zest for bearing arms. In contrast to the spirit of the Governments of the Early Modern Western parochial states, which already delighted in war as ardently as any of their successors, a great majority of the population of Western Christendom was thus at this date still unmilitarized. While they were already being victimized by their rulers' warlike propensities, they had not yet become their rulers' accomplices in the public crime of making war for the love of it.

This initial unmilitary-mindedness of the peasantry and bourgeoisie of Modern Western Christendom is perhaps one explanation of the long survival there of the practice of treating military service as a professional career for 'expendable' foreign mercenaries rather than as a patriotic duty for respectable citizens. Scottish and Irish mercenaries were still employed, side by side with Swedish national forces, by Gustavus Adolphus in the Thirty Years War (*gerebatur* A.D. 1618-48), and German mercenaries by the Dutch and Venetian Governments in the Western General War of A.D. 1672-1713 and in the Veneto-Ottoman War of 1683-1715. The British Government employed hired Hessian conscripts as well as voluntarily enlisted native British professional troops in North America in its war with the insurgent people of the British colonies there in A.D. 1775-83; and as late as the time of the Crimean War (*gerebatur* A.D. 1854-6) it raised a foreign legion of German, Swiss, and Italian mercenaries amounting to nearly thirteen thousand men, all told.³

Even after the hired foreign mercenary had been superseded by the native professional soldier as the typical man-at-arms on Western parade-grounds, so ardent a militarist as Frederick the Great had reversed, as we have noticed already in another context,⁴ his father's imprudent step of conscripting Prussian artisans as well as Prussian agricultural serfs;⁵

¹ The Rivieran principality of Monaco engaged in the corresponding state enterprise of maintaining a navy for hire (see Fueter, *op. cit.*, p. 231) before it went in for the still more profitable public business of turning a sovereign independent city-state into an international gambling resort.

² See *ibid.*, p. 19.

³ See Fortescue, J. W.: *A History of the British Army*, vol. xiii (London 1930, Macmillan), p. 227. When the writer of this Study was a child, he once met an old lady who told him that, in her own childhood, she had seen, encamped on the South Downs, the German mercenaries who, as she put it, had been hired to garrison Great Britain while the bulk of the small native British professional army of the day was on active service overseas. By the time of writing in A.D. 1951, the writer could not recollect his informant's identity, but the memory of what she had told him some fifty years or more ago was clear enough to send him in search of verification of it. The passage, cited in this footnote, of Fortescue's classical work shows that, out of close upon 10,000 German and Swiss mercenaries assembled in Great Britain from May 1855 onwards, about 6,000 were in fact retained there, while nearly 4,000 were sent to the seat of war.

⁴ In IV. iv. 145-6.

⁵ In an eighteenth-century Western World a selective conscription of the peasantry had been supplemented by the conscription of convicts and other 'social misfits'. The

and King Frederick William I himself would no more have dreamed than his son ever dreamed of attempting to impose military conscription upon the Prussian bourgeoisie. Nevertheless, the replacement of foreign mercenary volunteer or conscript professional troops by native volunteer or conscript professional troops, which had become the usual practice of a Late Modern Western World by Frederick the Great's day, was the prelude to the institution of compulsory universal service that was to be inaugurated, six years after Frederick's death, in a French *levée en masse*; and the raising of a native professional infantry, in imitation of, and substitution for, the rare, prized, and therefore costly Swiss, had been started by the Governments of contending Modern Western parochial states during a general war of A.D. 1494-1525 that had been the first war in the first war-and-peace cycle in the current Western series.

A sixteenth-century Austria who, like a sixteenth-century France, had no martial native source to tap for the meeting of her requirements in infantry,¹ and whose Government's poverty made it impossible for it to compete on equal terms with the French Government in the Swiss mercenary market,² had soon found a recruiting ground in adjoining German lands—in Bavaria, in Swabia, in Alsace—for Landsknechts who were passably good cheaper imitations of Swiss models;³ and in a contemporary Spain the same necessitudinousness had been the mother of the same invention. On a Castilian Plateau which, like the Swiss highlands, was a predominantly pastoral country, the native herdsmen offered better material for making soldiers than the husbandmen who were numerically predominant in the populations of most sixteenth-century West European countries.⁴ A Spanish 'gente armada y ordinada a la suiza' is mentioned as early as the 13th April, 1504, in correspondence between Their Catholic Majesties and the *gran capitán* Gonzalo de Córdoba;⁵ by about the year A.D. 1520, this new-model Spanish infantry had made its début in the field of Western warfare;⁶ and a Spanish copy had proved itself more versatile than its Swiss original in, for example, its capacity to storm fortresses besides fighting pitched battles.⁷ A partial and gradual militarization of the population of Western Christendom, which had thus begun soon after the opening of the sixteenth century of the Christian Era with these German and Spanish national imitations of a Swiss model, had been the prelude to the wholesale militarization which had been inaugurated, some three hundred years later, in the French *levée en masse* of A.D. 1792.⁸

Napoleon's intemperately aggressive abuse of this newly forged French weapon had provoked a more thorough-going adoption and more efficient organization of compulsory universal military service in A.D. 1807-13 in an only temporarily crushed and humiliated Prussia; and

legislation of the day, which was the reflection of an oligarchic régime, had the effect of driving into the ranks of 'the criminal classes', and from these into the ranks of the armed forces, categories of offenders who might have been saved for Society if they could have had the benefit of the more humane Western legislation in force mid-way through the twentieth century.

⁸ The tragically crucial importance of this revolutionary French step has been noticed in IV. iv. 150-1.

the political unification of Germany and Italy under the auspices of the military-minded Houses of Hohenzollern and Savoy in the course of the fifty-six years following the close of the Napoleonic Wars had militarized Western Christian populations—in Tuscany, Saxony, the former city-states of Frankfurt-am-Main, Bremen, Hamburg, and Lübeck, and elsewhere—which had long since become unaccustomed to bearing arms. The last members of Western Christendom to hold out against the twentieth-century Franco-Prussian institution of compulsory universal military service had been the English-speaking peoples; but in the United States ‘the draft’ had been introduced and enforced on both sides in the Civil War of A.D. 1861–5; in Australia and New Zealand compulsory military service had been adopted in A.D. 1909, albeit reluctantly and, as it turned out, only temporarily,¹ by two overseas Western peoples who had come to fear that their thinly populated territories might be coveted today, and appropriated tomorrow, by the congested populations of Eastern Asia; and an institution which the United States had found herself constrained to revive, and Great Britain to introduce, *ad hoc* in the two first world wars had been retained in both countries after the Second World War when the World had found itself in a twilight state that was neither war nor peace as these had been known in the past. Yet a still rising institutional tide of militarization had hardly begun to reach the English-speaking peoples before the psychological tide of martial-mindedness had begun to ebb in France.

The French psyche was, indeed, a psychological barometer on which the readings at successive dates of Western history since A.D. 1494 had been apt to give accurate forecasts of imminent rises and falls in the strength of martial feeling in the Western World as a whole. The progressive militarization of Western Christendom in the course of the four centuries beginning with a French King Charles VIII’s invasion of Italy had been registered in the French people’s change of mood from the peaceableness (perhaps due to their still lively memories of their sufferings in the Hundred Years War) that had been characteristic of a majority of the French people in the first chapter of this tragic story to the chauvinism that had come to be characteristic of a majority of them by the Napoleonic Age. This adventitious aggressive spirit in France had not been blunted by the horrors of the Grand Army’s retreat from Moscow in A.D. 1812 or by the experience of fighting on French soil in A.D. 1814 or even by the humiliatingly decisive defeat, at Waterloo in A.D. 1815, of a light-hearted attempt to reverse the military decision of the preceding year. Thereafter, the French had still had in them the spirit to seek psychological compensation for the loss of an abortive Napoleonic French empire in Europe by embarking in A.D. 1830 on the arduous aggressive military enterprise of conquering a substitute-empire in North-West Africa; and a French aggressiveness which had thus survived a chastisement with whips at Waterloo had required the sharper sting of a chastisement with scorpions at Sedan to make it wince and wilt. The nemesis of a Napoleon I’s militarism had not deterred French-

¹ Compulsion was suspended in Australia in A.D. 1929 and in New Zealand in A.D. 1930.

men of a later generation from placing their lives and fortunes in the hands of a Napoleon III; and, after having pandered to his subjects' still impenitently militaristic taste by leading them successively into a Roman adventure in A.D. 1849, a Russian adventure in A.D. 1854-6, an Austrian adventure in A.D. 1859, and a Mexican adventure in A.D. 1862-7, this second-rate practitioner of a dangerous trade had committed his country in A.D. 1870 to a Prussian adventure in which the agonies of the Hundred Years War had been concentrated within a Time-span of seven months. This terrible retribution upon France for a militarism to which her Government had been addicted since A.D. 1494, and her people since A.D. 1792, had been so shattering a psychological experience that French souls had never afterwards fully recovered from it.

Though in A.D. 1914 a conscript French national army had patriotically flown to arms to stem a fresh German invasion, and though for four years thereafter the French people had heroically endured casualties of a severity that was crushing for a country in which the population had ceased to increase, besides being grievous for millions of bereaved families, the French had emerged in A.D. 1918 from this deadly struggle for existence with a sharpened consciousness of having been caught by the malice or nemesis of History in a strategico-political position that was so perilously exposed that, sooner or later, it must prove untenable. History had condemned France in a post-Modern Age to have for her next-door neighbour a German national state that was at least as aggressive-minded as France had ever been at her worst, and that was now far more than a match for France in industrial war-potential, as well as in man-power. On the 11th November, 1918, the French had been aware that they would never have emerged on the winning side from a war with the Germany of that day if the combined strength of all the English-speaking peoples had not also been thrown into the anti-German scale; and from that moment onwards France's English-speaking allies and associates had started perversely to do their worst to break French hearts by serving public notice on France that she could not depend upon their being willing to come to her rescue again if the German peril were once more to loom up. In these cruelly unpropitious circumstances the French had entered an inter-war breathing-space in a mood of disillusionment and discouragement that had been registered in action eventually in France's collapse and capitulation in June 1940; and the ensuing passage of French history had been big with the future of the Western World as a whole.

The Vichyssois temper and régime had given a practical demonstration of a psychological process through which Nationalism, when carried to an extreme, could box the compass by turning into an equally extreme renunciation of a traditional will to maintain and assert a parochial sovereign independence. Frenchmen, responsible at the time for the government of their country, who, on the 16th June, 1940, had rejected with indignation Churchill's eleventh-hour offer of a voluntary political union on equal terms between a then all-but-conquered France and a then still unconquered United Kingdom, on the ground that this British offer was an insidious move to consummate the sacrifice of France for

the United Kingdom's benefit, did not rebel when, six days afterwards, on the 22nd June, they were required to sign an armistice which placed France at the mercy of a National Socialist Germany, and did not refuse, after that, to accede to German demands for French collaboration with Germany's continuing war-effort against a Britain who, till yesterday, had been France's ally, though a German victory over Great Britain would have extinguished France's last hope of ever being liberated from the German yoke to which she had bowed her neck. The ostensibly nationalist Vichysois slogan 'la France seule' was a euphemism for the unspeakable truth that France had placed herself at Germany's disposal and had accepted the shameful role of principal slave to a foreign tyrant nation that had attacked and conquered its neighbours in Continental Europe as a first step towards attacking and conquering the rest of the World with sinews of war that were to be reinforced thanks to the pliancy of Continental European victims who were to be bullied into becoming their German conquerors' accomplices.

It was true that a demoralized French nationalism would never have entered into a transaction of which it was manifestly ashamed if the alternative course demanded by a traditional standard of heroism had not been beyond the French people's powers of endurance under novel technological conditions of warfare which had keyed up a once familiar and tolerable ordeal to an unprecedented degree of severity; but this turn of a technological screw was not the whole explanation of the collapse of French *moral* that had declared itself in A.D. 1940. Part of the explanation also was that, for nationalist-minded souls, the psychological difficulty of acquiescing in the abrogation of a national sovereign independence by a foreign conqueror's exercise of an irresistible brute force was not so great as the psychological difficulty of taking the initiative in voluntarily surrendering some agreed part of the same national sovereign independence in order to enter into co-operation with people of other nations, on a footing of equality, in a loose confederation like the League of Nations or in a full federal union like the United States—and this though the difference between the respective effects of these two alternative ways of foregoing sovereignty was the extreme difference between purchasing security through co-operation and paying the penalty of subjection for the luxury of choosing the psychologically easier option of accepting a *fait accompli* imposed by *force majeure*.

The second factor that was reinforcing the effect of an advancing Technology in undermining a parochial patriotism was a victory of class-feeling over patriotism in a competition for precedence between two conflicting expressions of sectional corporate self-interest that were irreconcilable in the last resort. In a France that had been living under the régime of a *Front Populaire* from June 1936 to April 1938 a considerable portion of the middle class had apparently come, by A.D. 1940, to feel that the aggression of its working-class fellow-countrymen on a domestic front was a greater menace to the preservation of the middle class's most highly prized assets than the aggression, on an international front, of a Fascist Power which promised to protect a compliant French

bourgeoisie's private property as a *quid pro quo* for the abrogation of their country's national sovereignty.¹

If in France the Vichyssois policy and spirit had thus demonstrated that the experience of a First World War had made one once aggressively martial-minded Western nation willing to purchase peace 'at any price', the French people's British allies had been convicted of a willingness to purchase peace 'at almost any price'² by a policy and spirit of 'appeasement' (in a pejorative connotation of the word) that had been in the ascendant in Great Britain from the 18th September, 1931, when her inter-war temper had first been put to the test by the opening move in a new Japanese campaign of military aggression in the Far East, and the 10th May, 1940, when the British people had taken for their leader a statesman who had lost no time in putting their temper to the test again by his challenging offer to his countrymen of 'blood and toil and tears and sweat'³ as the price that must be paid for the United Kingdom's present survival and future victory.

From June 1940 to August 1945 the British people had paid as appallingly heavy a price for the purchase of an inestimably valuable spiritual treasure as the French people had paid in A.D. 1914-18; and in A.D. 1952, some seven years after their release from this supreme ordeal, it had still to be seen whether the ultimate psychological effect of a Second World War on British *moral* would or would not prove to have been the same as the effect of a First World War had proved to have been on French *moral*. Would British souls that had been willing to purchase peace 'at almost any price' rather than have to face a Second World War be found willing to purchase it 'at any price' if a third world war were to descend upon them? There were, after all, limits to Human Nature's powers of endurance, even in communities of the toughest moral fibre fortified by the most Spartan martial tradition. If the spirit of France had flinched in June 1940 at the prospect of having to face casualties in the field even heavier than the French casualties in A.D. 1914-18 and having to see the whole of her metropolitan territory overrun by a temporarily victorious enemy, how was the spirit of Britain likely to react to the prospect of seeing a congested island subjected to an intensive bombardment with guided atomic missiles which would do incomparably greater execution than the heaviest of the blows recently delivered by Göring's *Luftwaffe*?

The answer to this question was no foregone conclusion, and any future follower, German or Russian, in Hitler's footsteps would be inviting the fate that Hitler had brought on himself and his ambitions if, like Hitler, he were to gamble on the answer to the question turning

¹ Similarly, in a China that had been living under the régime of a Kuomintang during the years A.D. 1928-48, a considerable section of the industrial working class and even of the peasantry had apparently come, by A.D. 1948, to feel that the incompetence and corruption of this ruling clique of a Chinese *intelligentsia* was a greater evil than the hegemony of the Soviet Union under which they would be allowing their country to fall if they acquiesced in the liquidation of the Kuomintang régime by a Chinese Communist Party.

² 'Not peace at any price, but peace at almost any price' (Mr. Eden in the House of Commons at Westminster on the 25th June, 1937).

³ Mr. Churchill in the House of Commons at Westminster, 13th May, 1940.

out to be that the British no longer had any spirit left in them; yet, for all that, the question could not be denied a hearing in A.D. 1952; and the British people was not, of course, the only people in the World at this date about whom this importunate question had to be asked. If it was at least questionable whether a third world war would be endurable for the people of the United Kingdom, it was manifestly questionable *a fortiori* whether this tribulation would be endurable for Continental West European peoples who had undergone in the years A.D. 1940-5—and, in the Belgian, French, Italian, and Polish cases, in the years A.D. 1914-18 before that—an experience that was more harrowing, and very much more demoralizing, than the British people's ordeal of an aerial bombardment. These Continental West European victims of an inordinate German militarism had seen their countries partially or completely overrun and occupied by invading hostile armies, and they had found themselves at the mercy of an occupying alien enemy that had taken advantage of its power over them to distraint upon their material resources for the reinforcement of its own war effort against their surviving allies and to harness their energies to its own evil will by training upon them all the terrors of a post-Modern Western totalitarian police-state.

This institutional engine of militarism had been keyed up to a sinister efficiency on the home fronts of a Fascist Italy and a National-Socialist Germany; and, while in A.D. 1952 it was indisputably true that Western Europe as a whole had had its martial spirit damped by its devastating experiences since A.D. 1914, was this true without reservations of the two West European countries in which Fascist national governments had deliberately re-stoked the local fires of militarism after the First World War with the intention of profiting, in a Second World War, by a consequent marginal difference between the respective limits of their foreign victims' and their native instruments' capacity for continuing to stand the traditional test of an ordeal by battle? What had been the ultimate effect, on Italian and German souls, of the misdeeds that they had allowed their governments to require of them, and of the retribution that they had consequently allowed their governments to bring down upon their guilty heads? In what mood had the Italians emerged from the twenty-one years A.D. 1922-43, and the Germans from the twelve years A.D. 1933-45?

An observer in the year A.D. 1952 could predict with some assurance that the Italians would prove to have no more stomach for a Mussolinian militarism to which a majority of the nation had paid lip-service, not because they ever had it in them to go forth conquering and to conquer¹ any foreign people that was their match in technical equipment, but because they did not have in them the spirit to defy the will of a domestic tyrant from the Romagna. It was assuredly no accident that there was always an exceptionally strong local resistance to Fascism in a Piedmont that was also exceptional in being the one locality in a twentieth-century Italy that had preserved something of an earlier martial tradition. On this showing, it might be prophesied in A.D. 1952 that Italy would go the

¹ Rev. vi. 2.

same way as the rest of Western Europe. But could the same prophecy be made at the same date with the same confidence about Germany, where the traditional Prussian militarism that Hitler had stoked up to such incendiary effect manifestly had a far more wide-spread and far more tenacious hold on the souls of the people?

This question was one of grave concern to non-German West Europeans at a moment when, with their reluctant and half-hearted assent, the Americans were soliciting a German people that had attacked and overrun its neighbours twice in one lifetime to revive a martial tradition that, within living memory, had cost the rest of the World two world wars. At the time of writing, it was impossible to predict what the German response was going to be to a challenge presented to Germany by the current quarrel between the ex-victors in the latest of two wars that Germany had made and lost. Which of two features in the new situation would loom the larger in German eyes? The possibility for Germany of reacquiring political power by auctioning German military services to the higher bidder of the two parties that were now feverishly competing for so unquestionably valuable a military asset? Or the possibility of exposing herself to suffer a fate that would be even worse than the fate that she had brought upon herself in A.D. 1945, and indeed as bad as the fate that she had experienced in A.D. 1618-48, if she were now to become the battlefield of a war between foreign Powers by whom she had formerly been 'encircled'? On the morrow of the War of A.D. 1939-45 there were signs in Germany that some Germans, at any rate, had by this time had enough of sacrificing life, property, and conscience by submitting to serve as 'cannon-fodder' for successive German Governments to spend in successive wars of aggression ending in successive disastrous defeats; and the emergence of this mood in Germany after VE-Day, 1945, was, after all, something that was to be expected in the light of similar changes of heart which, at earlier dates, had come over other West European peoples who, in their day, had been addicted to Militarism no less strongly or persistently than the Germans.

The Germans' French victims, as we have already noticed, had lent themselves to Militarism for 376 years (A.D. 1494-1870), till they had been cured of it by a crushing German retort. A Swedish militarism that had been rampant since Gustavus Adolphus (*regnabat* A.D. 1611-32) had disembarked his expeditionary force on German soil on the 27-28th June, 1630, had been extinguished by a subsequent and consequent Swedish experience of being bled white by Charles XII (*regnabat* A.D. 1697-1718). A Spanish militarism that had been coeval with its French counterpart had evaporated after the Thirty Years War. "Therefore say: "Thus saith the Lord God: . . . I will put a new spirit within you; and I will take the stony heart out of their flesh and will give them an heart of flesh".¹ When this God-given change of heart had been vouchsafed, in recent Western experience, to the Spaniards and the Swedes and the French, it seemed unlikely that the Germans would be proof against an influence to which these other West European peoples had all yielded. Spanish, Swedish, and French hearts had been changed, sooner or later,

¹ Ezek. xi. 16 and 19.

by the experience of learning through suffering (*παθει μάθος*);¹ and since A.D. 1914 the Germans had received, in their repeated punishment for a repeated sin, a double measure of this sovereign spiritual education. 'Whom the Lord loveth He chasteneth, and scourgeth every son whom He receiveth',² was a timeless truth that held out hope for the conversion of the Germans in the sixth decade of the twentieth century of the Christian Era.

No doubt the non-German West Europeans, in their dealings with their German neighbours at this critical time, might, while putting their trust in God, still feel inclined, *en attendant*, to keep their powder dry.³ Yet, notwithstanding the openness of this question concerning Germany, by the year A.D. 1952 it looked as if, in a Western Europe which had already been put to the torment of a Second World War, dispirited nations and exasperated social classes had been reduced, by the combined operation of the psychological forces analysed above, to a temper in which their moral capacity to offer resistance to a world-conqueror would be at a minimum.

The Significance of Hitler's Bid for World-Dominion

The opportunity for political crime on an oecumenical scale which had been opened up by a recession of Militarism in Western Europe had indeed been visible to Hitler as early as the morrow of the First World War.

Hitler had perceived that, in a World whose peoples were all now miserably war-weary and war-shy, world-dominion might be the easy prize of any nation that could still be coaxed, duped, doped, or flogged by an audacious demagogue or despot into being one degree less unwarlike than its neighbours. 'In the realm of the blind the one-eyed man is king.' On the strength of this intuition Hitler had cold-bloodedly remilitarized Germany and then attacked Poland, four small West European countries, and France; and the sensationally successful results of these successive criminal acts had testified to the correctness of Hitler's calculations up to that point. The German people, for the second time in one lifetime, had duly allowed themselves, not only to be used by a German Government as instruments for the commission of an international crime, but to be induced to play this criminal role with all their heart, soul, mind, and strength;⁴ a Polish people that had remained exceptional in having lost nothing of its martial spirit had been overwhelmed by a German aggressor's crushing superiority on the plane of Military Technology; and the collapse of Hitler's West European victims had justified Hitler's thesis that, in the state of mind and feeling then prevalent in Western Europe, a small margin of superiority in martial spirit might earn for a boldly wicked aggressor a fabulous dividend in military conquests. Hitler was reported to have said, and this not in jest, that all good pacifists ought to wish him success because the con-

³ 'Put your trust in God, my boys, and keep your powder dry' (Blacker, Valentine: *Oliver's Advice*).

⁴ Mark xii. 30.

centration of a monopoly of military and political power in Germany's hands was the only practical means, in the World as it was, of translating the ideals of Pacifism into reality. Hitler was, in truth, offering the World, at his own price, a commodity—freedom from fear of further world wars—of which Mankind stood in dire need, and for which they were therefore already prepared to pay dear.

In psychological principle, therefore, the business of world-conquest on which Hitler had embarked was as 'sound' as it was immoral; and, if in the event this would-be world-conqueror, so far from making Germany's and his own political fortune, brought down upon his Third Reich and upon himself a disaster that eclipsed the previous downfall of the Hohenzollern Reich and Dynasty, this was because Hitler was guilty of two fatal errors, of which the second, at any rate, might have been avoidable.

The builder of a Third Reich who had also been the creator of National Socialism had made the price of a *Pax Teutonica* so intolerably high in requiring submission to a Nazi German domination that, at the first glimmer of a prospect that this tyranny might ultimately be foiled and overthrown, resistance movements sprang up in even the tamest of the countries that Hitler's armies had overrun, while a British people which had allowed its governing class to practise 'appeasement' towards Japan, Italy, and Germany from A.D. 1931 to 1939 falsified the not irrational expectations that Hitler had founded on his observation of this decidedly un-martial and apparently persistent British temper by refusing to accept peace at Hitler's price even when the collapse and capitulation of France in A.D. 1940 had left Britain fighting on alone without any apparent prospect of staving off imminent defeat and subjugation.

Hitler's second fatal error was his abandonment of a hitherto brilliantly successful policy of administering his aggression to his victims in successive doses nicely calculated to be, each time, just not too large for a docile patient to swallow; and this error looks like a gratuitous one, since an historian cannot descry any contemporary change in the international situation that could have forced Hitler's hand in this crucial issue. By his seizure of Bohemia and Moravia on the night of the 15th-16th March, 1939, Hitler made it certain that, when he went on to attack Poland, he would find himself this time at war with Great Britain as well; by ensuring the belligerency of Great Britain, he converted a local war into a general war; by thus bringing on a general war, he ensured the eventual intervention of the United States (whatever assistance his Japanese accomplices might or might not eventually give in driving the United States into belligerency); and, by thus condemning Germany, sooner or later, to be smitten by the full force of an industrial war-potential in the United States that amounted to more than half the aggregate industrial war-potential of the whole World at the time, Hitler was condemning Germany to receive a knock-out blow. Moreover, as if this chain of inevitable and inevitably fatal consequences of a false step taken on the 15th March, 1939, was not enough to make sure of Hitler's frustrating his own purposes, he gratuitously attacked the Soviet Union

after he had failed to subdue Great Britain and had succeeded in moving the United States to convert herself into 'the arsenal of Democracy'.

It will be seen that Hitler's eventual failure to impose peace on the World by force of arms was due, not to any flaw in his thesis that the World was ripe for conquest, but to an accidental combination of incidental errors in his measures for putting into execution a nefarious grand design that, in itself, was a feasible scheme for profiting by a correctly diagnosed psychological situation. A twentieth-century World, that had thus, in A.D. 1933-45, been reprieved, thanks only to a chapter of lucky accidents, from a fate which Mankind's patently increasing defeatism and submissiveness had almost provocatively invited, could hardly count upon any future would-be world-conqueror's being so clumsy as to let the same easy prey escape for the second time by allowing himself to blunder in his turn into an Hitlerian combination of egregious errors; and, if a future follower in Hitler's footsteps was unlikely to make Hitler's mistakes, he could, on the other hand, be sure of profiting by his Nazi forerunner's pioneer work in clearing the ground for a successor to cultivate; for, in failing by so narrow a margin to win the prize of world-dominion for himself, Hitler had left the prize dangling within the reach of any successor capable of pursuing the same aim of world-conquest with a little more patience, prudence, and tact.

The yeoman service that Hitler had performed for some future architect of a *Pax Oecumenica* was his historic achievement of forcing an oecumenical society that had already been devastated by one world war to inflict upon itself, within the lifetime of the generation that had been smitten by that shattering catastrophe, a Second World War that had brought still more grievous tribulations upon the World at large, and especially upon Europe. An Hitlerian 'revolution of destruction'¹ was an irrevocably accomplished fact by the time when Hitler came to grief; and the collapse of all Hitler's designs for the aggrandizement of Germany left this negative result of his criminal career intact. In A.D. 1952 it was manifest that, in failing to win world-dominion for his own abortive Third German Reich, Hitler had bequeathed, to any successor with the ability to take advantage of this opportunity, the legacy that Assyria had bequeathed to the Achaemenidae, Ts'in She Hwang-ti to Han Liu Pang, and Pompey and Caesar to Augustus.² Hitler, finding the peoples of a twentieth-century Westernizing World already psychologically devastated by the experience of one world war, had left them more than doubly devastated by a more harrowing repetition of the same experience within the same lifetime. A field that in A.D. 1914-18 had been scored by trenches and pitted with shell-holes had been ploughed up by bulldozers and effaced by bomb-craters in A.D. 1939-45. An *Oikoumenê* that in August 1914 had been under cultivation as a chequer-board of national allotments had now become a waste-land open to a unitary occupation. For a post-Hitlerian empire-builder, Hitler's derelict legacy was a gift of the Gods.

¹ Rauschnig, H.: *Germany's Revolution of Destruction*, English translation (London 1939, Heinemann).

² See V. vi. 186-7.

The Temper generated by Militarization in the Non-Western Peasantry

At the time of writing, it could not be foreseen whether, after a failure for which Hitler had paid with his reputation as well as with his life, other adventurers would embark on an enterprise in which the magnitude of the risk was proportionate to that of the prize that would be the reward of success. It could, however, already be foreseen that, if Hitler did have successors, their calculations, like his, would largely turn on estimates of the marginal differences in the degree in which vestiges of a martial spirit still survived in the hearts of the divers peoples of a world in which a traditional heroism was everywhere being called in question by the revolutionary psychological effect of technological changes. For the purposes of our own present inquiry into the prospects of the Western Civilization at this date, we may find it illuminating to take our stand in a hypothetical post-Hitlerian aggressor's observation-post and try to read, through his eyes, a psychological map of the contemporary *Oikoumenê* on which the aggressor may be imagined to have plotted out, for his purposes, the local differences in the degree of the defeatism and submissiveness that he can count upon in the hearts of his intended instruments and victims.

In attempting such a psychological survey, we have to bear it in mind that even the most judicious aggressor might be prone to fall to some extent into Hitler's error of over-estimating the lengths to which he could go with impunity. Even in an Atomic Age, traditional virtues and ideals might be expected to die hard when, like martial valour and like patriotism, they had in them the momentum of a five-or-six-thousand-years-long tradition. In setting our standard of expectation in regard to the prospective behaviour of a Westernizing World in the second half of the twentieth century of the Christian Era, we shall be wise to recall such pertinent historical precedents as, for example, the alacrity with which, in 522 B.C., some of the peoples that had been passed under Assyria's harrow seized an opportunity—offered by the assassination of an occupant of the Achaemenian imperial throne who was the last legitimate representative of the Cyran Achaemenid line if he was not an impostor—to plunge their world into anarchy again and expose themselves once more to all the horrors suffered by their forebears in the eighth and seventh centuries B.C., in the hope of depriving themselves of the dearly bought blessings of a *Pax Achaemenia* and resubjecting themselves to the curse of a now manifestly anachronistic parochial sovereign independence. With this cautionary tale in our minds we may perhaps venture on a tentative appraisal of the diversities in the temper of the divers peoples of a Westernizing World on the morrow of its Second World War. Manifestly the crucial question here was whether the martial spirit which had been ebbing out of Western Europe had evaporated or had migrated to other regions of the *Oikoumenê*.

The second of these two possibilities required consideration because, by A.D. 1952, it had become clear that the thirty-eight years which had now passed since the outbreak of the First World War in A.D. 1914 had brought to pass a dramatically complete inversion, not only of Western

Europe's previous temper, but also of her corresponding previous role. A region out of which one wave of aggression at the heels of another had been surging up indefatigably and travelling to the uttermost parts of the Earth for some four centuries and a quarter, ending in A.D. 1914, had now become the battlefield of a World which, in that now past chapter of history, Western Europe had been knitting up with herself by innumerable acts of economic, political, and cultural victimization; and this recent revolution in Western Europe's strategico-political situation was one of the experiences that had made the mood of her inhabitants apprehensive and conciliatory instead of confident and truculent. This reversal of fortunes and feelings in Western Europe, which had become manifest to all politically conscious West Europeans, and indeed to all their politically conscious contemporaries, by A.D. 1952, had been perceptible on the morrow of the First World War to the sensitive spirit of a French man of letters in the light of his own people's tragic experience and limpid intelligence.

'Un frisson extraordinaire a couru la moelle de l'Europe. Elle a senti, par tous ses noyaux pensants, qu'elle ne se reconnaissait plus, qu'elle cessait de se ressembler, qu'elle allait perdre conscience — une conscience acquise par des siècles de malheurs supportables, par des milliers d'hommes du premier ordre, par des chances géographiques, ethniques, historiques, innombrables. . . .

'L'Europe va-t-elle garder sa prééminence dans tous les genres? L'Europe deviendra-t-elle *ce qu'elle est en réalité*, c'est-à-dire: un petit cap du continent asiatique? Ou bien l'Europe restera-t-elle *ce qu'elle paraît*, c'est-à-dire: la partie précieuse de l'univers terrestre, la perle de la sphère, le cerveau d'un vaste corps? . . .

'La balance qui penchait de notre côté, quoique nous paraissions plus légers, commence à nous faire doucement remonter — comme si nous avions sottement fait passer dans l'autre plateau le mystérieux appoint qui était avec nous. *Nous avons étourdiement rendu les forces proportionnelles aux masses!* . . . Notre science — devenue moyen de puissance, moyen de domination concrète, excitant de la richesse, appareil d'exploitation du capital planétaire — cesse d'être une "fin en soi" et une activité artistique. . . . L'utilité du savoir fait du savoir une *denrée* qui . . . se préparera sous des formes de plus en plus maniables ou comestibles; elle se distribuera à une clientèle de plus en plus nombreuse; elle deviendra chose du commerce, chose enfin qui s'imité et se produit un peu partout. . . . Donc, *la classification des régions habitables du monde tend à devenir telle que la grandeur matérielle brute, les éléments de statistique, les nombres — population, superficie, matières premières — déterminent enfin exclusivement ce classement des compartiments du globe.* . . .

'Le phénomène de la mise en exploitation du globe, le phénomène de l'égalisation des techniques et le phénomène démocratique, qui font prévoir une *diminutio capitis* de l'Europe, doivent-ils être pris comme décisions absolues du destin? Ou avons-nous quelque liberté *contre* cette menaçante conjuration des choses? C'est peut-être en cherchant cette liberté qu'on la crée.¹

On the morrow of a Second World War that had harrowed Western

¹ Valéry, Paul: 'La Crise de l'Esprit', in *Variété* (Paris 1924, Gallimard, Éditions de la Nouvelle Revue Française), pp. 13-14, 24, 30, 29, 30, and 32.

Europe far more cruelly than the War of A.D. 1914-18, it was evident that this cradle of the Western Civilization had indeed been overtaken by the fate that, on the morrow of the First World War, Paul Valéry had still been hoping against hope to see her succeed in keeping at bay. The knack of using the products and copying the procedures of a West European technology had by now been effectively acquired by other inhabitants of an *Oikoumené* which had been unified by a secular movement of West European aggression; and, on the fringes of a world of which Western Europe had been the heart, a successfully propagated West European technique could command the brute force of an area of territory, a volume of non-human natural resources, and a head of population that this technique had never had, and would never have, at its disposal in the hands of its West European originators.

What use were Western Europe's pupils going to make of the power which their painful education had now placed in their hands? The wave of militarization, whose course since A.D. 1494 we have already traced within the narrow limits of Western Europe, had not come to rest at an expanding Western World's original boundaries or slackened the pace of its advance because the native Western peoples who had first set it travelling were now becoming war-weary as a consequence of having continued to indulge in recurrent bouts of warfare for more than four and a half centuries. Since the close of the seventeenth century of the Christian Era this ever advancing wave of militarization on Western lines had engulfed one after another of the once autonomous non-Western societies that had been drawn successively into an expanding Western Civilization's ambit; and in each case the introduction of this alien Western institutional process had had the same consequence as it had been having in the West since the opening of the overture to the current Western series of war-and-peace cycles. In the Western World at the turn of the fifteenth and sixteenth centuries of the Christian Era, the West European peasantry, with a few small local exceptions, had, as we have seen,¹ been strangers to the bearing of arms, and War had been the business of either a foreign mercenary infantry and light horse or a native feudal heavy cavalry; but we have also seen² that, since the General War of A.D. 1494-1525, there had been a sustained series of moves in all militant Western states to substitute native troops for foreign troops in all arms, conscripts for volunteers, and a universal compulsory service imposed on the whole population, without distinction between classes, for an earlier selective compulsory service in which the peasantry had been made to bear the brunt of the burden. These effects of modern militarization in the Western World itself were reproduced when the wave of militarization on Western lines spread to the once autonomous societies that were being swept into a Western net.

In these originally non-Western societies, as in the Western World itself in the past, the peasantry had as a rule been non-militant. The principal public service that had been required of them by their rulers had been to provide, out of their production of food and fibres, for the feeding and clothing of relatively small fighting forces consisting of

¹ On pp. 491-2, above.

² On pp. 492-4, above.

specialists for whom the bearing of arms at the public expense had been, not a *corvée*, but a privilege. These fighting forces might be recruited from transfrontier barbarians, such as the Gurkhas and Pathans who had served in the British Indian Army,¹ the Mongol bannermen, both tribal and professional,² who had been employed by the Manchu régime in China, or the Egyptian Mamlûks of Eurasian Nomad or Caucasian highlander origin; they might be recruited from members of some alien civilization, like the British troops employed by the British Rāj in India, the Iranian Muslim troops employed by these British empire-builders' Timurid Mughal predecessors,³ the Abyssinian Monophysite Christian mercenaries employed by the Muslim states in the Deccan which the Timurids eventually swallowed up,⁴ or the Egyptian Mamlûks of Georgian Orthodox Christian origin; they might be recruited from the descendants of conquerors, drawn from one or other of the two external sources above mentioned, who had made themselves at home in the country, like the Manchu bannermen in China⁵ or like the Rājput heavy cavalry of Hun and Gurjara origin who served the Mughal Raj as *foederati*, the Marāthā light horse of Saka origin who became the vanguard of an anti-Mughal Hindu counter-offensive, and the Jāt and Doghra fighting men, likewise of Saka origin, who became the backbone of a Sikh Khālsā; or they might be recruited from a feudal class of indigenous origin, like the Japanese Samurai. Examples of professional troops recruited from a native peasantry are rare in the antediluvian chapters of the histories of the non-Western civilizations that were swamped by a Western deluge and whose military systems were consequently revolutionized by the impact of Western arms and influences. The highly selective compulsory levy of boys from the Orthodox Christian peasantry of the Ottoman Empire, which eventually became the principal source of recruitment for the Pādishāh's Slave-Household,⁶ is one historic case of the kind; the enlistment of extramural Chinese volunteers in the professional banners of the Manchu Imperial Army⁷ is another. The Streltsy ('Archers') raised by Ivan IV (*dominabatur* A.D. 1533-47; *imperabat* A.D. 1547-84) were Muscovite counterparts of the contemporary Janissaries.

With these three institutionally notable, but numerically inconsiderable, exceptions, the peasantry in the non-Western societies, like the peasantry in the Western World at the dawn of a Modern Age of Western military history, had, as the foregoing summary indicates, for the most part not been permitted, and *a fortiori* not been compelled, to bear arms before the military institutions of these non-Western societies were revolutionized, one after another, by the Western Civilization's impact. In all these encounters with the West except the Hindu World's and Russian Orthodox Christendom's, the impact did not occur on the military plane until after an English Industrial Revolution had begun to make

universal compulsory military service an economically practical possibility,¹ and until after this possibility had been translated into a portentous accomplished fact in the fateful French *levée en masse* of A.D. 1792; and therefore everywhere, except in Russia and India, the effect of the introduction of Western military institutions was to militarize *en masse* at one stroke, without any transitional phase of selective conscription, a peasantry that had been non-militant up to that moment.

The Petrine Russian Army was exceptional in passing first through the phase of selective conscription, which was the system in vogue in the eighteenth century in the armies of the Continental European Western states, before following a French lead into the subsequent Western system of universal conscription. As for the British Indian Army, it remained a select professional force of the eighteenth-century Western type in its method of recruitment, and a force of privileged specialists of the pre-Western type in its sources of recruitment, until it passed out of British control upon its transfer in A.D. 1947 to the Governments of the British Indian Empire's Indian and Pakistani successor-states. Throughout the British chapter of its history the Indian Army continued to be recruited by voluntary enlistment and to be composed of troops drawn partly from transfrontier barbarians and partly from the so-called martial communities of barbarian origin in India itself. Its mainstays were the Jāts, Doghras, and other breeds of Panjābī manhood which, in the ranks of an early-nineteenth-century Sikh Army organized on Western lines by ex-Napoleonic Western officers,² had been the latest, and sole formidable, Indian antagonists of the British in a competition of all against all for the Mughal Empire's heritage.

The British Indian Army was perhaps the most conservative, as well as the most efficient, of the non-Western fighting forces that had been reorganized on a Western new model; yet, even in this decidedly old-fashioned military institution, the necessity of 'Indianizing' the cadres as a preliminary to handing the Army over to indigenous Indian successor-states of an abdicating British Rāj had been taken as an opportunity for making a breach in the traditional practice of recruiting the personnel almost exclusively from certain privileged communities.³ In the cadres from which, between the years A.D. 1918 and A.D. 1947, the previous British personnel was progressively withdrawn,⁴ the replacements were

¹ Professor William McNeill comments: 'There are real economic obstacles to the militarization of the World's peasantry. Where can a peasant country get modern arms? It takes at least a generation to establish an industry capable of producing them locally; and conditions for reduplication of the Russian *tour de force* cannot be assumed to be present in countries like India and China necessarily or, I should say, even probably.'

In A.D. 1952 the answer seemed to be that the peasantry could get arms from one or other of the two industrially potent Super-Powers that were competing, at this time, for the peasantry's allegiance. A North Korean, Continental Chinese, and Communist Annamese peasant soldiery was being armed from an 'arsenal of Communism' in the Soviet Union, while a South Korean, Formosan Chinese, and anti-Communist Annamese peasant soldiery was being armed from an 'arsenal of Democracy' in the United States.

² See IX. viii. 731.

³ As late as A.D. 1930 divers communities domiciled in the Panjāb were still providing 54 per cent. of the combatant troops in the British Indian Army (see *Report of the Indian Statutory Commission*, vol. i, Survey (London 1930, H.M. Stationery Office = Cmd. 3568), p. 96, and the instructive map of India facing this page).

⁴ In A.D. 1923 a decision had been taken to 'Indianize' five infantry battalions, two cavalry regiments, and one pioneer unit; in A.D. 1932 the decision was taken to 'Indianize'

no longer made solely from those indigenous Indian communities that had previously shared with alien British officers the privilege of manning their country's fighting force. Steps were deliberately taken to ensure that the elimination of the British element from a force that had hitherto been virtually an Anglo-Panjābī preserve should not have the effect of making it a Panjābī monopoly, at the risk of saddling India with a Panjābī Rāj—or pair of Panjābī successor-states, one Hindu and one Muslim—in place of a British Rāj. Pains were taken to make certain that indigenous Indian candidates for commissions should be drawn from all over the country, and the same new policy was applied to the recruitment of other ranks. The pace of this transformation of the Indian Army was greatly accelerated in the course of the Indian Army's expansion during the Second World War. In consequence, the militarization of India had entered, by A.D. 1947, on the same stage that the militarization of Russia had reached in the eighteenth century. Though the peasantry had not yet been subjected to a military service that was either compulsory or universal, their enrolment, by voluntary recruitment, in an army that had previously been a preserve for traditionally martial communities, indigenous and foreign, had set the Indian peasant's feet on the military road which the Russian peasant's feet had begun to tread after the way had been cleared in Russia by Peter's destruction of the Streltsy in A.D. 1698-9.¹

This militarization of a previously non-militant peasantry, which had thus begun in Russia in A.D. 1699 and in India in A.D. 1918, had also been taking place in other quarters of the World. There is no need to retell in this place a story that has already been told in previous contexts.² It will suffice to recall that the militarization of the peasantry had been put in hand in Egypt after the destruction of the Mamlūks in A.D. 1811; in Turkey after the destruction of the Janissaries in A.D. 1826; in Japan after the voluntary abdication of the indigenous feudal lords (the *daimyō*) and their indigenous military retainers (the *samurai*) in A.D. 1868-9; in China after the deposition of the Manchu Dynasty, and disbanding of the Manchu Imperial banner regiments, in A.D. 1911; in Korea after her annexation by Japan in A.D. 1910. In the present context the only further observation that has to be made is that this revolutionary militarization of the peasantry had not been confined to the Old World. An eighteenth century that had seen the Russian peasant inducted into selective military service on the contemporary West European pattern had seen in Paraguay the warlike traditions of the *ci-devant* barbarian Guaraní reanimated by the policy of resourceful Jesuit philosopher-kings who had been prompted by their benevolence to make this pro-

one division of all arms and one cavalry brigade; and in the October of the latter year an Indian Military Academy for the training of Indian officers was opened at Dehra Dun; but the beginnings of the 'Indianization' of the British Indian Army went back to the last year of the First World War. From A.D. 1918 onwards a small number of vacancies in the Royal Military Academy at Sandhurst had been thrown open to Indian candidates, and, from A.D. 1928 onwards, vacancies had also been offered at Woolwich (the training institute for the British Royal Engineers and Artillery) and at Cranwell (the training institute for the British Royal Air Force). In A.D. 1931 the number of vacancies offered to Indian candidates at Sandhurst had been ten, while at Woolwich it had been three.

² In VI. vii. *passim* and IX. viii. *passim*.

vision for the defence of their Reductions against marauding *Mamelucos* from Brazil;¹ and, after the break-up of the Spanish Empire of the Indies into a score of mutually hostile successor-states, the forgotten wars which the Guaranís had fought in the seventeenth century as soldiers of the Society of Jesus, and in an earlier age as barbarian invaders of an Andean Empire of the Four Quarters, had been refought in the nineteenth century in Paraguay's deadly single-handed war of A.D. 1864-70 against the combined forces of Brazil, Uruguay, and Argentina, and in the twentieth century in her duel with Bolivia in A.D. 1930-35 for possession of the Gran Chaco. In Mexico, again, since the revolution in A.D. 1910 against an oligarchy of Creole Spanish and other alien origin, the descendants of once martial Toltecs and Chichimecs had exercised themselves, like a previously non-militant Chinese peasantry since the revolution in A.D. 1911 against a Manchu 'ascendancy', in chronic civil wars which had been 'undecisive', though unfortunately not 'temperate', contests.

This widespread militarization of a hitherto primitive and, for the most part, pacific peasantry, that, mid-way through the twentieth century of the Christian Era, still accounted for some three-quarters of the living generation of Mankind, was an event that could hardly fail, in the long run, to have some decisive effect on the destinies of a Westernizing World. Its most impressive feature was one that was manifestly pregnant with alternative possibilities, good and evil. In almost every case, these hitherto unmilitary peasants had no sooner been drilled and armed according to the latest Western fashion than they had astonished the World by defeating, and this with ease, old-fashioned warriors of the traditional type who had hitherto taken it for granted that the peasants were of no military account.

The Egyptian fallāhīn, who had been subjugated, oppressed, exploited, and despised by an interminable series of martial alien conquerors, proved their mettle by breaking the resistance of the Moreots, in those wild highlanders' native mountain lairs, in A.D. 1825, only one year after Mehmed 'Alī had begun to draft the fallāhīn in any appreciable numbers into his new-model army,² and some two thousand years after they had given their latest previous proof of a capacity to make good soldiers when, in the service of another Macedonian master of their country, Egyptian peasant phalangites had defeated Greek peasant phalangites in pitched battle at Raphia in 217 B.C.³ This twice-performed achievement of the peasantry of Egypt had been capped by the peasantry of Japan when in A.D. 1877, only four years after the implementation in A.D. 1873⁴ of the conscription law of A.D. 1870,⁵ they had put down an insurrection of a dissident faction of the *samurai* of the self-assertive fief of Satsuma⁶ against a Meiji régime that had been inaugurated in A.D. 1868-9.

The prowess of these Japanese peasant conscript soldiers in this early ordeal is the more noteworthy considering that, in A.D. 1873, they had

shown a distinct reluctance and apprehension¹ upon their receipt of the summons to take up a military calling from which they had been jealously excluded for at least a thousand years past, and considering further that, in the event, the first enemy whom they had been called upon to face in the field had been a war-band of those indigenous Japanese feudal warriors whom the Japanese peasant had been taught sedulously, throughout those last thousand years, to revere as his legitimate and invincible lords and masters. Even the parvenu element in a British Indian Army had had time, before the transfer of the *rāj* in A.D. 1947, to demonstrate, by gallant conduct in the General War of A.D. 1939-45, that it, too, had military virtue in it which, through the long age of inhibition, had been awaiting, undamped, the first opportunity to declare itself. For example, a Bihar Regiment, raised in A.D. 1941-2,² and a Madras Regiment, reformed in A.D. 1942, both distinguished themselves on the Burma front in warfare that was perhaps the severest ordeal to which any troops engaged in this Second World War were subjected in any theatre of operations.

The beneficial consequence of the peasant conscript's prompt and conclusive success in proving himself in action to be the traditional privileged warrior's military peer was the gain won by each of these military demonstrations for the civil cause of social justice. One of the conspicuous moral shortcomings of Civilization during the first five or six thousand years of its currency had been its endowment of a small minority with material and spiritual treasures at the expense of a large majority whose own share in the fruits of the whole body social's co-operative labours had been as inequitably inadequate as the minority's share had been inequitably excessive.³ This moral flaw had reappeared in the histories of all the civilizations that had risen and fallen since the breakdown of the Egyptian Civilization in the Age of the Pyramid-Builders;⁴ so long as the flaw was allowed to persist, the institution of Civilization would remain morally unsound; and, in an aeon in which Mankind in Process of Civilization had not yet succeeded in extricating itself from the practice of War, it would perhaps have been too much to hope that a *misera plebs contribuens* should succeed in securing a long-since overdue modicum of social justice without having first vindicated its claim in an ordeal by battle. Nevertheless, it could be argued in A.D. 1952, on the evidence of disconcerting events, that militarization had by then already proved in practice to have been too high a price to pay for an approach towards egalitarianism. The course of Japanese history since A.D. 1877 aptly illustrated this point; for, while, on the one hand, the Japanese conscript peasant army instituted in the Meiji Era had proved to be the one effective institution for securing a minimum of social justice for a still conspicuously depressed majority in a Japanese Society that had continued,

¹ See Sansom, *op. cit.*, p. 411.

² The First Bihar Regiment came into existence on the 15th September, 1941, when the Eleventh Battalion of the Nineteenth Hyderabad Regiment was converted into a regular battalion and redesignated. This was the first time that aborigines were recruited into the Indian Army. The Second Battalion of the Bihar Regiment was raised on the 1st December, 1942, at Agra. Fifty per cent. of its recruits were from the aboriginal forest hill tribes of Chota Nagpur.

⁴ See I. i. 141-2.

in the main, to be authoritarian and oligarchic, this self-same Japanese conscript peasant army had been employed during the same period as an instrument of military aggression against Japan's neighbours by a Westernizing régime in Japan which had been unable or unwilling to think of any better device for raising the standard of living of a depressed peasantry within the national frontiers than the method—long since condemned by the judgement of History, but not yet discredited in human consciences—of taking tribute by force of arms from a still more deeply depressed peasantry in foreign parts.

An historian, contemplating this evil consequence—exemplified in recent Japanese history—of the success with which the peasant majority of Mankind was being militarized on Western lines, could find no comfort in the fact that an aggressive Militarism, evoked by this institutional process of militarization, had carried its Japanese addicts into disaster in A.D. 1945 in a military adventure in which a new-model military machine was being perversely used by its makers for the morally indefensible purpose of trying to raise the peasantry's standard of living in one country at the rest of the World's expense by force of arms; for in this case, as in others, Militarism had not recoiled upon its authors until after it had enabled them to inflict monstrous injury on Society at large. If the observer was to gauge the probable effects of the militarization of the peasantry upon a Westernizing World's prospects, he had to ask himself whether the hatching of Militarism from militarization, which had been the sequel to the history of militarization on Western lines in Japan, appeared to be the rule or the exception in a Westernizing World's current history.

There were, no doubt, here and there, peasant populations that could be militarized with impunity. The Egyptian peasant conscript army was perhaps a case in point; for the promise—or menace—implicit in the inaugural victory that it had won in an offensive campaign against the Moreots in A.D. 1825 had been belied by its signal failures to suppress the Mahdī Muhammad Ahmad's insurrection in the Sūdān in A.D. 1883–5 and to expel the Zionists from Palestine in A.D. 1948–9.¹ Thus in Egypt the militarization of the local peasantry bade fair to be as innocuous as it had been in the Kingdom of Naples.²

Was it this Egyptian experience or was it the Japanese experience that was to be taken as an index of the effect of militarization on the temper of the non-Western peasantry as a whole? At a moment when a North Korean and a Chinese conscript peasant army were fighting side by side

¹ The Egyptian Army crossed the Egypto-Palestinian frontier on the 15th May, 1948; an armistice agreement between the Egyptian and Israeli governments was signed on the 25th February, 1949.

² The significance of a conscript Egyptian peasant army's on the whole inglorious record is underlined by Professor William McNeill in the following comment: 'Among some peoples the psychological obstacles to militarization are tremendous. A nation without military traditions presents very refractory material. Egyptian fallāhs and Porto Rican jibaros are two cases, and some of the Indian peoples—the Bengalis, for example—must be similar. The military virtues cannot be called into existence at will, yet are very useful if an army is to fight effectively.' The military virtues can, however, manifest themselves spontaneously when they are given a chance, as is demonstrated by the records of the Bihar and Madras regiments of the Indian Army in the Second World War (see p. 510, above); and this Indian evidence is no less pertinent than the Egyptian evidence.

against a composite Western expeditionary force in a Korean theatre of military operations, while a Russian conscript peasant army in reserve was standing to arms both in Eastern Siberia and in Eastern Germany, it was evident that the temper and capacity of troops of this type would count for much in the shaping of a Westernizing World's destinies. What light was thrown on the peasant-soldier's qualities by his past performance? History indicated that, as might have been expected *a priori*, he was at his strongest in military situations calling for the exercise of the passive military virtues. He was stronger in endurance than in initiative, and stronger in defending his own country against an invader than in playing the invader's part himself.

In the history of a Westernized Russian peasant army, which was older, by more than a century, than other armies of the kind, the glorious passages, up to date, had all taken the form of ultimately successful wars of defence fought on Russian soil against an invader who, in the first phase of the war, had been apt to carry all before him. This had been the story of the Northern War of A.D. 1700-21, in which Peter the Great's callow peasant army had won its spurs in A.D. 1709 at Poltava, in the Ukraine, against Charles XII's far-ranging Swedes; the story of the foiling of Napoleon's invasion of Russia in A.D. 1812; and the story of the foiling of Hitler's invasion in A.D. 1940-4, when, in November 1942, the tide had been turned at the approaches to Stalingrad. On the other hand, in the Russo-Turkish wars of A.D. 1828-9 and A.D. 1877-8, in which the Tsar, by assuming Charles XII's and Napoleon's aggressive role, had thrust the Westernized Russian peasant army's classic defensive role upon this army's feebler Turkish counterpart, the noteworthy feature, on each occasion, had been, not Russia's victory in the second year's campaign, but her failure to overcome Turkey's resistance in the first campaigning season.

The extent of a nineteenth-century Russia's superiority over a nineteenth-century Turkey in military resources, as well as in experience of waging war on Western lines, had made an ultimate Russian victory a foregone conclusion in any trial of strength between the two Powers in that age; the length of the time that it had taken Russia, in both wars, to win her inevitable victory, and the heaviness of the price that she had found herself compelled to pay for it, had given the measure in which a conscript peasant army's *moral* and efficiency were apt to depreciate when this military instrument was transferred from the defensive role in which it felt itself at home to an aggressive role which it was accustomed to associate, not with glorious victories won by its own arms, but with shameful defeats incurred by enemy invaders of a patriot peasantry's own country. The beau rôle of offering a patriotic resistance to an invader was the moral advantage that had inspired a Turkish conscript peasant army to give so good an account of itself, against such heavy odds, in otherwise desperately adverse circumstances. A newly enrolled Turkish peasant-soldiery's achievement in the campaign of A.D. 1828, when it had succeeded in preventing the Russian Army from crossing the Balkan Range, had been particularly meritorious, considering that Sultan Mahmūd II had not been able to make any serious progress with the

organization of his new-model army until after the destruction of the Janissaries on the 15th June, 1826.

The same conclusions emerge from the history of a Chinese conscript peasant army organized on Western lines since the overthrow of the Manchu régime in A.D. 1911. After twenty years devoted to preliminary domestic exercises in civil wars, the Chinese peasant-soldier had won his spurs in his stubborn defence of an area in Greater Shanghai against a Japanese assault from the 28th January to the 3rd March, 1932.¹ In psychology as well as in strategy this campaign had been reminiscent of the Russo-Turkish wars of A.D. 1828-9 and A.D. 1877-8, and it had been prophetic of China's ultimate victory over Japan in a defensive war on a sub-continental scale that was to drag on from A.D. 1937 to A.D. 1945. At Shanghai in A.D. 1932, as in the Balkans in the nineteenth century, the moral victory had been won by the belligerent who had managed by sheer endurance to postpone the hour of a defeat which he knew to be ultimately inevitable owing to the odds being overwhelmingly in his antagonist's favour, while this ultimate victor had been humiliated by having to take so long, and pay so high, to overcome the resistance of an antagonist who was notoriously not his match.

If a non-Western peasant-soldiery that had proved itself so stalwart in wars in defence of its own hearths and homes had thus been found to lose so much of its spirit when it was led into wars of aggression on foreign soil, was not this an historical fact that was of good augury for Mankind's prospects? Did it not mean that, though the non-Western World had been following Western Europe along the road of militarization, there might nevertheless be some hope that the baneful rankling of militarization into Militarism, which had been the ruin of Western Europe, might not, after all, be the destiny of the World at large? Any Western observer who might be tempted to look to this consideration for comfort in A.D. 1952 would have been wise to temper his optimism by reminding himself that the quality in the non-Western peasantry which had made it possible to drill them so easily into becoming, for the most part, such unexpectedly good soldiers was a habit which would also impel them unquestioningly to obey the word of command, even when this bade them advance gloomily to the attack instead of bidding them stand cheerfully on the defensive. The soldierly trait in this peasantry's traditional ethos was an ingrained habit of submissiveness imprinted by an immemorially old experience of living in a state of serfdom on the verge of starvation; and a submissiveness that had not availed to beget a fighting-man when it had been mated with militarization in the soul of an Egyptian fallāh had borne a dragon's-tooth crop in the soul of this Egyptian peasant's Korean cousin.

A Western historian who, *en route* from Pusan to Seoul on the 15th November, 1929, has seen nothing in the Korean peasants, visible from his railway-carriage window, except a pathetic submissiveness mated with a comic unpracticality, had lived to chide himself, twenty-three years later, for having left out of account, in committing himself to that

¹ See Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs, 1932* (London 1933, Milford), pp. 480-95.

ill-judged appraisal, the combination of martial prowess and technological resourcefulness through which those ineffective-looking Koreans' indomitable forebears had once countered and defeated a Japanese assault upon their country in the Korean-Japanese War of A.D. 1592-8. This admonitory testimony of Korean history had been ignored by the Western traveller in A.D. 1929, as his own words now rose against him to testify.

'[The] inaudible music of the Korean landscape [this traveller had written in A.D. 1929] was not the serene and triumphant "music of the spheres"'. It was an elegy in a minor key—a dirge over a country that was in the autumn of its days. The rhythm was repeated in the movements of the little people who were working conscientiously but languidly in the fields or creeping along the roads. The little men and little women were all dressed in white—appropriately to the country's mood, since white in the East is usually the colour of mourning, yet in a manner obviously quite unsuitable for the day's work. In other countries the husbandman girds up his loins for the combat with Nature. But nobody could possibly gird up those voluminous white robes; and what hours the women must spend in washing out of them the mud imparted daily by those terraced fields in which their wearers laboured! The last touch of quaintness was given by the men's diminutive top-hats of black glazed gauze which were held in position on the crown of the head by a ribbon tied under the chin. . . . Yes, the poor Koreans were a joke. . . .

'Look at this scene at a country railway station where . . . the local Japanese colony is seeing off the Japanese police-commandant and his lady. . . . Where . . . are the Koreans? For there is nobody visible on this Korean platform except the Japanese colony and ourselves. O, there they are, a whole crowd of them, herded behind a barrier in the background. The expression on their pathetic faces was not even faintly resentful. It was wholly submissive. And, as I glanced from one row of faces to the other, I felt as if I were a spectator of some comedy of manners, with the Japanese playing "empire-builders" and the Koreans "ryots" or "fallāhīn". So the Koreans were Japan's Bengalis! And I could scarcely suppress an unmannerly guffaw as I suddenly thought of a colony of ants bearing sway over their insect-cattle.'¹

The wayfaring Occidental Philistine who had written these patronizing words in A.D. 1929 had it is true, also written, in the same context, that a 'ghostly music, audible all the time to the inward sense, would not allow one to forget that', besides being a joke, the Koreans 'were a tragedy'; and, in the light of an obvious analogy between Japanese rule in Korea and a British Rāj in India which, in A.D. 1929, was already in process of liquidation, he had also foreseen the passing of a Japanese ascendancy.

'As I strolled up and down that platform, looking at the scene that was being played before me there, the inaudible music of the Korean landscape began to develop a secondary theme, which was an elegy over the prospects of Japanese dominion. While the overtones were still sounding the dirge of Korea's national past, this undertone sang the transitoriness of all insular conquests on Continental ground.'²

¹ Toynbee, Arnold J.: *A Journey to China* (London 1931, Constable), pp. 185-6.

² *Ibid.*, p. 187.

This twenty-three-years-old intimation of mortality was still pertinent in A.D. 1952, since by that date the ever accelerating shrinkage in the scale of the *Oikoumenê*, as measured in terms of human means of communication, had reduced the effective size of the Island of North America to about that of the British Isles or the Japanese Archipelago twenty-three years back. Yet, in catching in A.D. 1929 this glimpse of the irony in the destiny of an ephemeral Japanese rule in Korea, the observer had failed to penetrate to the inwardness of the tragedy in the destiny of Japan's Korean subjects. What he had seen had reminded him of the social insects, but he had failed to apprehend the meaning of this cue. He had failed to recollect that the inhuman or superhuman discipline to which the social insects had subjected themselves had enabled them to cultivate a super-Spartan Militarism;¹ that a discipline which had been the matrix of Militarism had been the fruit of habits of docility, industry, and endurance; that, for the inculcation of these ant-like or bee-like *mores* in the Human Psyche, the best school in the World had been the life and labour of a primitive peasantry working at a standard of living just above starvation-level; and that it was no accident that Frederick II's Prussian Janissaries, like Mehmed II's Ottoman Imperial Slave-Household before them, had been recruited from a subject peasantry and not from the wilful and wayward scions of a traditional privileged warrior class.

The traditional submissiveness of the peoples of Asia had, since time immemorial, taken the political form of passive obedience to arbitrary governments. and the cultural process of Westernization would have to go far beyond the rudimentary accomplishment of acquiring a Western military technique before the Asian peasant-soldier would begin to think of questioning, or, *a fortiori*, defying, orders from above to sacrifice his life even in an aggressive war that meant nothing to him personally. On the other hand the citizens of West European states who were accustomed to exercise at least some measure of control over their governments, through parliaments composed of their own elected representatives, would be apt to display their novel unwarlikeness in compelling their governments to submit, Vichy fashion, to a foreign aggressor rather than go to war for the traditional object of preserving their countries' sovereign independence at a cost in life, property, and welfare which the West European peoples might now no longer have the will to pay.

How far could mid-twentieth-century Asian governments go in exploiting their subjects' ingrained submissiveness for military purposes? On the evidence of recent history, they could go less far in a war of aggression abroad than in a defensive war fought on their own soil; yet History had demonstrated that they could make their peasant armies obey, however reluctantly, the order to march into battle even in a foreign campaign for which they had no heart. What were the limits of the Asian peasant-soldier's endurance in honouring his rulers' demands upon his self-sacrificing submissiveness? In Western eyes it might look as if the Chinese or Russian peasant-soldier had given his government a blank cheque drawn on his life; yet History had demonstrated that there

¹ See III. iii. 88-111.

was some limit—however remote this might be by Western standards—beyond which neither a Chinese nor a Russian Government could venture, with impunity, to continue to turn the screw on their long-suffering subjects. Chinese régimes, from the Ts'in Dynasty's to the Kuomintang's inclusive, that had had the temerity to give the screw just one turn too many, had repeatedly paid for this excess by the forfeiture of their mandate to bear rule; and in Russian history it had been the same story.

The Temper in the Soviet Union and in the United States

A Tsardom that had had the wisdom to take the sting out of the Russian people's sufferings, defeat, and humiliation in the Crimean War by conceding the reforms of the eighteen-sixties had paid with its life for its stiff-neckedness in refusing to forestall trouble once again by paying a corresponding ransom for subsequent military reverses. The sufferings, defeat, and humiliation that the Tsardom had brought upon the Russian people by an imperialistic policy in Korea that had precipitated the Russo-Japanese War of A.D. 1904-5 had provoked the abortive Russian Revolution of A.D. 1905; the far worse tribulations of the General War of A.D. 1914 had cost the Tsardom its existence in the double revolution of A.D. 1917; and the breakdown of the Russian people's endurance on that occasion was noteworthy, considering that in A.D. 1917 the Russian peasant army had been fighting in self-defence against invading armies on Russian soil—a posture in which it had shown itself indomitable in A.D. 1812 and in which it was to display the same invincibility in A.D. 1941-4.

It seemed, then, that there were limits—even in a manifestly defensive war on home ground, and even without allowing for the unpredictable effects of atomic weapons upon the most tenacious habit of endurance—at which the *moral* of Russia or any other peasant country would collapse under the strain of war waged on Western lines. Russia, like France, but on a greater scale and to a more extreme degree, had suffered, twice in one lifetime, the agonies of a war in her own country, inflicted on her by a deliberately ruthless invader; and the fibre of Russian endurance could not be so tough as to have remained unaffected by this experience. Nevertheless, it seemed likely that the Government of the Soviet Union would face the terrors of a war with the United States rather than make any political concession to the United States that, in Russian eyes, would be tantamount to submission to an American ascendancy; and it also seemed likely that, if the Soviet Union did ever go to war with the United States, it would be able to carry a traditionally submissive Russian people with it, even if the initial military operations on the Russian side took the form of invading and overrunning countries allied to the United States, and not the form of resisting an American invasion of the territories of the Soviet Union and its satellites. Even then, a Russian peasant-soldiery's habit of submissively obeying their rulers' most distasteful orders might be expected to prevail over a war-weariness bred by recent and poignant experiences of war in their own country.

If it was thus likely that there were circumstances in which the Soviet Union could and would go to war with a Great Power of its own calibre,

was this also to be predicted of the United States? The question was a pertinent one, since there could not be a major war unless two Powers of first-class calibre were each prepared in the last resort to go to war with the other; and, when, at the opening of the latter half of the twentieth century, an inquirer put to himself the question whether the United States, as well as the Soviet Union, was willing to face a war with the one Power of her own calibre that was still on the map, he would find himself giving this question an affirmative answer.

Since the declaration of the independence of the United States, and perhaps since the first settlement of the oldest of the Thirteen Colonies, the American people had been one of the most unmilitary, yet at the same time one of the most martial, of the nations of the Western World. They had been unmilitary in the sense that they had disliked submitting themselves to military discipline and had had no Gallic ambition to see their country win military glory for such glory's own sake. They had been martial in the sense that, till the date of the closing of the frontier *circa* A.D. 1890, they had always numbered among them a contingent of frontiersmen accustomed, not only to bearing arms, but to using these at their own personal discretion in pursuit of their own private enterprises—a state of affairs which had become obsolete in Great Britain, even on the Anglo-Scottish Border, after the Union of the Crowns in A.D. 1603, and obsolete in most Continental West European countries since before the close of the fifteenth century. The martial spirit of ten generations of American frontiersmen would have been acknowledged by the North American Indians at any time since the first landing of White men from the British Isles on American coasts; by the English colonists' French rivals in the eighteenth century; and by their Mexican victims in the nineteenth century—and these encounters between the Anglo-American frontiersmen and their competitors for the possession of North America are also evidence that not only the frontiersmen, but the American people as a whole, were prepared, exceptionally and temporarily, to submit themselves to a military discipline without which the frontiersmen's personal spirit and prowess would have been unable to prevail against antagonists of their own cultural level.

The soldierly qualities latent in the American people as a whole had been revealed to their British adversaries in the wars of A.D. 1775–83 and 1812–14, and to their German adversaries in the wars of 1916–18 and 1941–5; but, up to date, by far the most impressive demonstration of American valour, discipline, generalship, and, not least, endurance had been given in a war in which Americans had been arrayed against Americans. The civil war of A.D. 1861–5 between the Union and the Confederacy had been the longest, the most stubborn, the costliest in casualties, and the most fertile in technological innovations of all wars in the Western World between the end of the Napoleonic Wars and the outbreak of the First World War; and this was a portent that the twentieth-century German militarists had twice overlooked to their own undoing.

Moreover, the two world wars that, within living memory, had harrowed Germany and Germany's Russian and West European victims, as severely as the American Civil War had harrowed the South, had left

the United States virtually unscathed. The psychological effects that two world wars in one lifetime had produced on the *moral* of West Europeans had hardly made themselves felt on the American side of the Atlantic. This immunity from a living experience of war in their own country seemed likely to prevail over a traditional aversion from Militarism if the American people were to be faced, or to believe themselves to be faced, with a choice between submitting to the Russians and fighting them; and in A.D. 1952 it could not be doubted by any open-eyed observer that the American people would indeed be prepared to face the terrors of a war with the Soviet Union rather than make any concession to the Soviet Union that, in American eyes, would be tantamount to submission to a Russian ascendancy. On this point of being willing to fight another major war in the last resort—and it was a crucial point for the eventual decision of the still open question whether there was, or was not, to be a Third World War—the Americans and the Russians felt and thought alike in A.D. 1952, as far as could be judged by a West European observer.

The Psychological Consequences of Atomic Warfare

Yet there was no people in the World—not even the Russian people and not even the American—that was in a position to boast in advance that, in a third world war, it would be capable of staying the course; for, though War might be coeval with Civilization itself, an advancing Western technology's discovery of the 'know-how' for releasing atomic energy for military purposes had now aggravated the incidence of a familiar social evil to a degree at which it seemed no longer likely to produce its familiar psychological effects.

The new psychological situation, created by the invention of atomic weapons, which had made an aggravation in the degree of the severity of the incidence of War amount to a difference that was virtually one of kind, arose, of course, out of the consequent immense enhancement of War's lethal power.

In War as it had been traditionally waged, each individual combatant had gone into action fortified by the knowledge that the chances were in favour of his coming through alive and even unscathed, and that, the greater the courage, the cool-headedness, and the discipline that he and his companions in arms displayed, the lighter their casualties were likely to be. In the history of Hellenic warfare down to 371 B.C., the Lacedaemonians had notoriously kept their casualties low by keeping their martial spirit high;¹ and even the devoted three hundred Spartiates who had gone to their deaths at Thermopylae in the year 480 B.C. had sacrificed their lives in the consoling knowledge that neither their country nor even their families would die with them. In picking his three hundred devotees, King Leonidas is said to have been careful not to take any fighting man who did not leave a son at home behind him;² he and these three hundred companions were all aware that, even if no single one of them were to return alive (and only two of them did survive in the event), the total loss of a force of this number would not jeopardize the

¹ Xenophon: *Respublica Lacedaemoniorum*, chap. ix, quoted already in III. iii. 63.

² Herodotus, Book VII, chap. 205.

existence, or even cripple the fighting-power, of a Lacedaemonian Commonwealth whose combatant strength was estimated to have been, at this time, about eight thousand Spartiates, all as good soldiers as the three hundred, without counting the fighting men from the perioecic Lacedaemonian communities, who were 'good enough soldiers, even though they might not be the Spartiates' equals'.¹ As for the future of the Lacedaemonian body politic, the Lacedaemonian Government were said to have received an oracle from Delphi assuring them that, in the current war with the Achaemenian Empire, Lacedaemon would not be wiped out by the enemy if a King of Sparta were to forfeit his life, and this was afterwards supposed to have been one of the decisive considerations in Leonidas' mind when he took his decision to stand fast at Thermopylae and die there.² Leonidas and the rest of the three hundred thus believed, on the day on which they went to their deaths, that, if they did lose their lives, there would infallibly still be a Sparta in being to receive the news that they had died in carrying out their countrymen's orders; and this is, of course, the theme of the Cean poet Simonides' immortally ambiguous couplet.³ They could also feel sure that these surviving countrymen of theirs would not forget either their deed or their names.⁴

The self-sacrifice of Leonidas and his three hundred in the year 480 B.C.⁵ was thus rational, as well as heroic, under the technological conditions in which War was waged in that year and at any later date down

¹ See the words that Herodotus puts into the mouth of the exiled Spartan King Damarátus, who was serving on Xerxes' staff, in Book VII, chap. 234.

² Herodotus, Book VII, chap. 220.

³ Quoted by Herodotus in Book VII, chap. 228.

⁴ Some thirty or forty years after the event a complete list of the names of the three hundred was obtained at Sparta by Herodotus (see Book VII, chap. 224).

⁵ G. B. Grundy, the distinguished Modern Western historian of *The Great Persian War* (London 1901, Murray), argues, in his chapter on Thermopylae (pp. 257-317), that, when Leonidas, after receiving the intelligence that his position had been turned by an enemy force, took his decision to continue to hold his ground, between the mountains and the sea, with the Lacedaemonian, Theban, and Thespian contingents of his own force, was not so much sacrificing his men's lives together with his own, but was dividing his force with the intention and expectation that the contingents which he was sending to the rear would not take the opportunity, as they actually did take it, for decamping, but would occupy and hold a position on the path over the mountains along which the enemy turning-movement was being made, in time to be able to bring to a halt the enemy's advance from this quarter, while Leonidas, with his half of the confederate army, continued to block the passage of the enemy's main body through the pass of Thermopylae itself.

This masterly and persuasive interpretation of what was in Leonidas' mind at that moment postpones the hour of the Lacedaemonian and Thespian contingents' witting and deliberate sacrifice of their lives without cheating these heroes of the glory of having performed their heroic act of self-sacrifice at a later hour of the same memorable day; for indisputably they did deliberately sacrifice their lives when, upon receipt of the news that the enemy turning-force had now succeeded in debouching out of the mountains on to the coastal plain in their rear, athwart their only possible line of retreat, they took their decision to retire to the famous hillock and make their last stand there, instead of taking a decision to lay down their arms, which was what the Thebans did in this now quite desperate situation.

Thus Grundy's theory, if accepted, leaves the Lacedaemonians and Thespians still eventually sacrificing their lives as deliberately as they are said to have sacrificed them in the traditional rendering of the traditional story.

In the course of his own reconstruction of the course of events, Grundy casts doubt on both the story of the oracle and the story that Leonidas did not take with him anyone who had not a son to leave behind him at Sparta. Yet the second, at least, of these two stories is surely credible, since Leonidas' expedition must, from the outset, have been one in which all participants will have faced the likelihood that they were going to lose

to the 6th August, A.D. 1945, when an atomic bomb was dropped on Hiroshima. Let us suppose, however, that the Babylonian, Egyptian, and Syriac civilizations had been 2,425 years ahead of a latter-day Western Civilization in the development of Military Technology. The supposition is not fantastic, considering that, in some branches of Technology, these older civilizations were at least that much in advance; and, if we allow this licence to our imagination, we may find ourselves puzzled to estimate how Leonidas and his three hundred would have acted in circumstances that would have stultified most of the considerations that are attributed to them.

Suppose that Xerxes' invading army had not been constrained, as it was, by the state of Military Technology at the time, to kill Leonidas and his three hundred companions in hand-to-hand combat with swords and spears, or at short range with arrows; suppose that they had had a stock of two atomic bombs, one to drop on the Greek force at Thermopylae, and another to drop simultaneously on Sparta—or, better still, that they had had a single hydrogen bomb whose explosion would instantaneously have destroyed all life in Continental European Greece and in the Aegean Archipelago before the Achaemenian expeditionary force had started cautiously to advance from its assembly-point in the interior of Anatolia: in those then inconceivable circumstances there would have been no perpetuation of the three hundred devotees' families, since the sons whom they had left behind at home would have been killed at the same instant as their fathers; there would have been no Sparta to receive the news of the three hundred heroes' faithfulness unto death¹ and to remember their deed and their names; no Simonides to compose an epitaph; and no monumental mason to engrave it. The presupposition of the three hundred Spartiates' self-sacrifice was an assurance—which, in these hypothetical circumstances, would have been denied to them—that, in giving their lives, they were saving their country's existence; and this was likewise the theme of another epitaph composed by Simonides in commemoration, not of Spartiates who had fallen in defence of Sparta against Achaemenian aggression, but of Tegeatans who had fallen in defence of Tegea against Lacedaemonian aggression some years later.

Τῶνδε δι' ἀνθρώπων ἀρετὰν οὐχ ἔκετο καπνὸς
αἰθέρα δαιομένης εὐρυχόρου Τεγέας·
οἱ βούλοντο πόλιν μὲν ἐλευθερίᾳ τεθαλυῖαν
παισὶ λιπεῖν, αὐτοὶ δ' ἐν προμάχοισι θανεῖν.²

their lives, even if they believed that the Lacedaemonian Government genuinely intended¹ to reinforce Leonidas' little army, and even if they were unaware that the position at Thermopylae could be turned via a path over the mountains. On the last day, when the position had in fact been turned by the enemy before any reinforcements had reached the Hellenic army, the normal human reaction was either to decamp (as was done by the contingents which, according to Grundy's hypothesis, had been detached by Leonidas to check the advance of the enemy turning-force) or thereafter to surrender (as was done by the Thebans). Even if Leonidas did go into action that day, with little more than one half of his total force, with the intention of still holding his position while the other half of the force checked the enemy's turning-movement, the decision in these circumstances to continue to hold his ground instead of withdrawing while the coast was still clear was heroic enough; and the Spartan and Thespian survivors' subsequent decision to die fighting after the enemy turning-movement had been reported to have achieved success was just as heroic as it has always been deemed to be.

² *Anth. Pal. VII. 512*; Bergk, *P.L.G.*, 4th ed., iii. 459.

¹ *Rev. ii. 10.*

The point made in this poem is that the fallen Tegeatan fighting-men had been free to choose between preserving their lives and sacrificing them and that, in choosing to sacrifice them, they had chosen right because, at this price, they had purchased the preservation of treasures which, for them, were of far greater value. Suppose, however, that, instead of being inspired by a reasonable hope of being able to save Tegea from physical destruction and to hand her on to their children with her political independence still intact, these heroic Tegeatan fighting-men had known in advance that a Lacedaemonian atomic bomb would annihilate Tegea's masonry, independence, and progeny in the same flash as her combatant troops in the field, what would have been a Tegeatan warrior's psychological reaction then? 'Who dies, if England live?'¹ was a question to which, in a pre-atomic age, a noble soul had been able to give only one answer; but this time-honoured challenge had undergone a disconcerting mutation since the explosion at Hiroshima on the 6th August, 1945, and the question had now come to read: 'Who can die to make England live, if England has to die with him?' While few might be found to dispute that *pro patria mori* was *dulce et decorum*,² it was not indisputable that to die *with*, instead of *for*, one's country would be either gratifying or even meritorious.

No doubt this reformulation of the question does not dispose of the problem, for there is an element in heroism which is beyond Reason because it is above it. If we can imagine Leonidas and his three hundred being deprived, by an ante-dated advent of atomic warfare, of all the reasons that they may have given to themselves to rationalize a resolve to sacrifice their lives, we can still imagine them doing, nevertheless, exactly what they did. When, sixty-five years, or thereabouts, before the three hundred Spartiates gave their lives at Thermopylae, Cyrus's general Harpagus had been imposing Achaemenian rule on the south-west corner of Asia Minor, the fighting-men of Xanthus, 'when they had been defeated in the field and been driven within their city walls', had 'collected their women and children and property and slaves in the citadel', had 'made a holocaust of them by setting the citadel on fire, and' had 'then bound themselves by the most formidable mutual oaths [to seek their own deaths], and' had 'duly made a sortie and died fighting to the last man'.³ On the same occasion the Xanthians' neighbours the Caunians had met the same challenge with the same response.⁴ This was also to be the response of the Marmareis in 334 B.C.⁵ and of the Tyrians in 332 B.C. to Alexander, of the Isaurians on the morrow of Alexander's death to Perdikkas,⁶ of the Carthaginians in 146 B.C. to Scipio Aemilianus, of the Xanthians (once again) in 42 B.C. to Brutus,⁷ of the Jews in A.D. 70 to

⁶ See Diodorus of Agyrium: *A Library of History*, Book XVIII, chap. 22, cited by Bevan, loc. cit.

⁷ See Appian of Alexandria: *The Roman Civil Wars*, Book IV, chap. 80. According to Appian, *ibid.*, this was actually the third time that the Xanthians had chosen annihilation in preference to surrender—the second of their three performances of the heroic deed

Titus, and of the Suliots who blew themselves up or threw themselves and their children over a precipice in A.D. 1803 rather than surrender to 'Ali Tepelenli.¹ Nor can we omit from this role of honour those execrable Assyrians who died like heroes at Harrân in 610-609 B.C., two years after the destruction of the wasps' nest at Nineveh.

It is, however, significant that in Jerusalem in A.D. 70 a majority of the besieged would have countenanced overtures for forestalling extermination by surrender if they had not been terrorized by a minority of fanatics into participating in these Zealots' suicidal heroism—under pain, as the penalty for 'peace talk', of being stabbed to death by the dagger of a Jewish *sicarius* before any Roman legionary's sword could come within striking distance of them; and, though Josephus, who is the source of our information, is a hostile witness to the conduct of the Jewish Zealots, there is no reason to suspect him of having falsified the truth on this point.

It is also significant that the Christian martyrs, who gave their lives rather than commit what would have been, in their eyes, an act of disloyalty to God, died in the confident belief that their blood was the Church's seed;² that a Church which Christ Himself had founded would endure, not only till Christ's ministers on Earth had had time to go into all the World and preach the Gospel to every creature,³ but to the end of Time; and that, though Heaven and Earth would pass away, Christ's words would not pass away⁴—as they believed that Christ Himself had declared after His resurrection and had then guaranteed by another positive act when He had ascended into Heaven, where He sitteth at the right hand of God the Father Almighty in *saecula saeculorum*. Though the citizens of this or that earthly commonwealth might have had the spirit, on occasion, to see their motherland perish with them, or even before them, rather than stoop to bow their necks to a foreign yoke, only the adherents of a religion that made no account of This World by comparison with an Other World could logically court, for the glory of God, a death that would be, not only their own death, but simultaneously the death of all life on the face of a planet that was their mundane home. It is all the more significant that the Early Christian martyrs, who did hold this transcendental belief, should have been inspired, not solely by a confidence that they were sacrificing their lives for the glory of God in a Heavenly Kingdom utterly beyond the reach of the most potent operations of a terrestrial human Technology, but also in part by a confidence that, by making this supreme personal sacrifice, they were promoting the propagation of Christ's Church Militant here on Earth—as Leonidas and his three hundred companions at Thermopylae had been confident that, by sacrificing their lives, they were furthering the mundane interests of the Commonwealth of Lacedaemon.

of mass self-immolation having been when they had refused to surrender to Alexander the Great.

¹ See Finlay, G.: *A History of Greece, B.C. 146 to A.D. 1864*, vol. vi (Oxford 1877, Clarendon Press), p. 51.

² See the passages from the works of Justin and Tertullian that have been quoted in V. vi. 202, nn. 2 and 3.

³ Mark xvi. 15.

⁴ Matt. xxiv. 35; Mark xiv. 31; Luke xxi. 33.

If it was thus true that even the Christian martyrs had been moved in part by a belief that their deaths would redound to the welfare on Earth of a Church and Faith that would live after them on Earth and would not die there with them, then we cannot know for certain what their psychological reaction would have been supposing that the Roman executioner's sword had been fraught with a hydrogen bomb's power to extinguish the Earthly Church Universal, throughout its geographical range at that day, from a Mesopotamian Edessa to a Baetican Gades and from an Egyptian Philae to a British Corstopitum. Would a martyr who knew in advance that this would be the earthly consequence of his own self-sacrifice have still gone unhesitatingly to his death with a serene confidence that he was doing God's indubitable will?

This was a hypothetical question that could never be answered conclusively by an historian living in A.D. 1952; but any human being at any date could comprehend that, if his martyrs-designate happened to be, not Christian transcendentalists, but post-Christian materialists who had deliberately invested in This World all their treasure, to the uttermost farthing,¹ it would be paradoxical to expect such self-made citizens of a 'Commonwealth of Swine'² to consent to sacrifice their lives for their treasure's sake if they knew in advance that, in the act, they would be bringing annihilation upon this mundane treasure as well as upon themselves; and this consideration was particularly pertinent to the circumstances of a Westernizing World mid-way through the twentieth century of the Christian Era; for in this world at this date—as, no doubt, in most times and places—both bona fide Christians and bona fide Spartans were rare indeed, while the Communist and Capitalist ideologies, whose respective champions were competing for the allegiance of all Mankind as eagerly and bitterly as if their beliefs and conduct had been poles apart, were in agreement with one another, and at variance with Christianity and with Spartanism alike, in setting up an exclusively mundane objective and ideal for Man, and differed from one another on this head only over the secondary question whether Man was to make a worldly success of himself as an individual or as a phalanstery.

What logic was there in asking a whole-hearted votary of either Capitalism or Communism to sacrifice his life for the sake of maintaining or improving a material mundane standard of living—not, of course, for his own personal benefit, *quod esset absurdum*, but even for the benefit of his family, tribe, or species—if the hydrogen bomb that was to take the prospective sacrificial victim's life was known by him in advance to be certain to extinguish in the self-same flash all possible beneficiaries of his proposed self-sacrifice? In this baleful light it looked as if an advancing Western technology's recent success in tapping atomic energy for use in War might have sapped the foundations of a traditional standard of heroism by stultifying some of the most compelling of the traditional motives for it.

(III) ALTERNATIVE POSSIBLE APPROACHES TO
WORLD ORDER

Our foregoing survey of the situation after the Second World War has shown that, at the opening of the second half of the twentieth century of the Christian Era, a Westernizing World found itself in a plight that can be summarily described as follows. Three recent achievements of Western technology—the coalescence and simultaneous shrinkage of the *Oikoumenê* and the invention of atomic weapons—had made it imperative for Man in Process of Civilization to abolish War; War could not be abolished unless the control of atomic energy employable for military purposes could be concentrated in the hands of some single political authority; this monopoly of the command of the master-weapon of the age would enable, and, in enabling, compel, the authority controlling atomic energy to assume the role of an oecumenical government; the seat of this oecumenical government must be either Washington or Moscow in the constellation of political forces that had emerged from the overthrow of Germany and Japan in A.D. 1945; but in A.D. 1952 neither the United States nor the Soviet Union was prepared voluntarily to place itself at the mercy of its sole surviving peer by submitting, without fighting, to seeing this rival arrogate to itself the world-wide political ascendancy that would be conferred automatically on either Power by a monopoly of the control of atomic energy for military purposes.

What was to be the denouement of this political problem-play? The line of least psychological resistance would, no doubt, be a resort to the old-fashioned expedient of ordeal by battle. Now that four centuries and a half of recurrent warfare in a Western arena had left only two gladiators still erect and *aktionsfähig*, a third world war might be expected to elicit a knock-out blow that would leave only one Power alive, with no competitor now remaining in the lists to dispute the sole survivor's monopoly of a control of atomic energy that would carry world-dominion with it. This catastrophic denouement was evidently feasible, since a world war fought with atomic weapons would be likely to have at least as conclusive an ending as the first and second world wars, both of which had ended in the decisive defeat of one side, though both these wars had been waged with relatively ineffective pre-atomic armaments. It could therefore be predicted that a third world war between the two remaining Powers would prove to be the final round in a series of contests that, since A.D. 1914, had already reduced the number of the Powers in this arena to two from eight. The outcome of a third world war thus seemed likely to be the imposition of an oecumenical peace of the Roman kind by a victor whose victory would leave him with a monopoly of the control of atomic energy in his grasp.

This denouement was foreshadowed, not only by present facts, but by historical precedents, since, in the histories of other civilizations, a Time of Troubles had been apt to culminate in the delivery of a knock-out blow resulting in the establishment of a universal state; but the precedents also suggested that Mankind could not afford in A.D. 1952

to resign itself to sanctioning a reperformance of this familiar tragedy. Whenever, in the histories of other civilizations, a series of cycles of warfare had eventually been brought to a close by the destruction of all the contending Powers except one single survivor, this barbarous remedy for a desperate malady had not availed either to save the sick civilization's life or to rid a war-stricken world of war in perpetuity, because the cost of arriving at a world order by this rough road had been mortally heavy. In the past the forcible establishment of an oecumenical peace had been purchased by a war-stricken society only at the prohibitive price of its inflicting wounds upon itself from which it found itself unable to recover; and, if this had been the ultimate effect of imposing universal peace by violence in a pre-atomic age, what were the Western Civilization's prospects in the event of its falling into a third world war in which a knock-out blow would be delivered with the unprecedented violence that had now been imported into the conduct of War by the invention of atomic weapons?

If the Western Society took this traditional war-path now that it was equipped with unprecedentedly potent armaments, would it not be condemning itself to purchase an ephemeral peace at a price that would be prohibitive? Would not the spiritual ravages of War, which had always been much harder to repair than its physical ravages, be likely, this time, to exceed all imaginable measure? Would not the agonies inflicted by atomic warfare make even a once humane and generous-hearted victor turn savage? These were considerations that might well deter the most fanatical Russian mind from allowing itself to believe that a third world war was the necessary price for completing the conversion of Mankind to the Communist Faith, and, *a fortiori*, deter the most sanguine American mind from allowing itself to believe that, the sooner a third world war was fought and won, the sooner the American people would be rid of the distracting anxieties of international politics and be free once more to devote themselves to the normal pursuits of private life. A sober-minded observer could foresee that after a third war fought with atomic weapons there would no longer be any possibility of life as it had previously been lived either in the United States or in the Soviet Union.

In these perilous circumstances the best hope for the future of Mankind lay in the possibility that the governments and peoples of the United States and the Soviet Union might have the imagination, wisdom, tolerance, self-restraint, patience, and fortitude to seek and ensue the one alternative to a third world war that, at this stage, was practical politics: that is to say, a pacific partition of the *Oikoumenē* between these two surviving Powers for an indefinite time to come. All the virtues enumerated above would be required on both sides if this policy was to have any chance of success, since it was evident that a society which had tapped atomic energy could never rest easy until it had brought under the control of some single oecumenical authority a newly released titanic physical force which would be a menace to the existence of at least half the Human Race, or, more probably, to the existence of the whole of it, so long as two mutually independent and antagonistic

Powers each remained at liberty to use this appalling weapon in waging war against its neighbour. Yet, if this risk of a Third World War fought with atomic weapons was the consideration that made the establishment of some kind of world order imperative, it would be a *reductio ad absurdum* of Mankind's quest for freedom from fear if, in seeking the solid and lasting security against a social catastrophe that was to be found in the establishment of a unitary control over atomic energy, the governments and peoples of the two surviving Great Powers were to precipitate the very catastrophe that all Mankind was concerned to avert. If the establishment of a world order was imperative for the sake of avoiding an atomic war, the avoidance of an atomic war must be imperative *a fortiori*, as an end in itself.

In the circumstances of the time the greatest menace to the welfare and existence of the Human Race was not the invention of atomic weapons, but the rise in living human souls of a temper reminiscent of a mood once prevalent in an Early Modern Western World for about a hundred years beginning with the outbreak of the Western Wars of Religion in the seventh decade of the sixteenth century of the Christian Era. At the opening of the second half of the twentieth century there were Capitalists and Communists who, like their Catholic and Protestant forerunners, felt it to be impracticable as well as intolerable to acquiesce in leaving the allegiance of Society divided, for an indefinite time to come, between an orthodoxy that they identified with their own faith and a heresy that they identified with the ideology of their adversaries. The wrong-headedness of this attitude was betrayed by the conclusion, logically following from it, that Orthodoxy was called upon by duty and self-interest in unison to combat, suppress, and eliminate Heresy by the ruthless employment of every weapon at Orthodoxy's command. The history of the Western Wars of Religion bore witness that spiritual issues could not be settled by force of arms; and the acquisition of atomic weapons gave warning that it would not be open to Capitalists and Communists in a post-Modern Age of Western history to learn the futility of religious warfare, and the necessity for religious toleration, by an empirical method of prolonged trial and chastening error that had been practicable for Catholics and Protestants in an Early Modern Age in which gunpowder was the deadliest weapon at the command of wrong-headed crusaders.

In the nineteen-fifties, as in the fifteen-sixties, the advocate of a patience that could claim to be the highest form of fortitude laid himself open, no doubt, to the charge of being a contemptible procrastinator who could offer no prospect of being able ultimately to avert the 'show-down' that he was cravenly seeking to postpone; but in the nineteen-fifties, at any rate, this taunt did the Fabian policy an injustice; for it failed to take account of the positive advantage that Mankind stood to gain by a successful pursuit of a policy of playing for time in the particular social circumstances of the Westernizing World of the day. The vehemence of the animosity, at this date, between the respective adherents of Communism and of a traditional Western way of life was one of the psychological effects of the sudden coalescence and shrinkage

of the *Oikoumenê* under the masterful impulsion of an ever faster advancing Western technology. It was an emotional reaction to the malaise that a Western and a Russian Society were both feeling as a result of finding themselves brought abruptly into an immediate physical contact with one another before either society had had time to become spiritually intimate with the other. Either party was having to accommodate itself to the sudden epiphany of a neighbour who had been a stranger to it during the centuries in which its own peculiar culture-pattern had been taking shape. What, on both sides, was now needed above all was time to allow a Subconscious Psyche, whose pace was the tortoise's gait, to adjust itself to the revolutionary situation created by the technological conjuring tricks of a Practical Intellect that had been racing ahead of its subconscious yoke-fellow at the pace of a march hare.¹

This common-sense consideration is clearly brought out in the following passage from the pen of a nineteenth-century Chinese philosopher:

'Now that the ingenious inventions of the steamship and the railway are enabling the European peoples to reach every corner of the Earth and every strange tribe of Mankind, the beginning of a world unity is here. When scattered races and nations are brought together, then divers civilisations will also gradually become unified. Our ancient sages made a distinction between the *Tao* [the Way of Life] and the *Ch'i* [the Tools]. The ways of life cannot be immediately unified; they must first be brought together by the tools or implements of human invention. The steamship and the railroad are the carriages of the ways of life. . . . Therefore, these great inventions, which the Western Powers are using for their encroachment upon China, are the very things which the sages of a future age will utilise as the means for the unification of the ways of life of all the nations of the Earth.'²

This shrewd Chinese observation brings out the further point that the psychological discomfort, and consequent animosity, that had been caused by Technology's feat of 'annihilating' physical distance, were not peculiar to the relations between a twentieth-century Western Society and a contemporary Russian Society. The same psychological disturbance had been produced by the same technological revolution in the West's relations with a Chinese Society and with all the other living non-Western civilizations. There had been a simultaneous and similar disturbance in the relations of these living non-Western civilizations with one another in so far as they had been brought abruptly into closer contact with one another through the introduction of Western means of communication; and these divers twentieth-century psychological tensions were so many examples of regular consequences of encounters between contemporaries that, in a previous Part of this Study,³ have also been illustrated from the histories of other arenas.

¹ See pp. 210-11, above.

² Wang T'ao (*natus* A.D. 1828), quoted by Hu Shih in *The Chinese Renaissance: The Haskell Lectures, 1933* (Chicago 1934, University Press), pp. 34-35. The contrast, in point of comparative effectiveness, between the respective careers of Wang T'ao and the contemporary Japanese pioneer of Westernization, Ito, is pointed out by Hu Shih, *ibid.*, pp. 10-12. Cp. pp. 33-34.

³ In IX. viii. 522-629.

Our foregoing study of encounters between contemporaries has lit up one truth that, in A.D. 1952, was most pertinent to the consideration of a Westernizing World's prospects. History showed that the psychological disturbance inevitably produced by an encounter was apt to be aggravated to a disastrous degree if either party sought impatiently to cut the Gordian knot by which he found himself unwelcomely tied to an uncongenial fellow-traveller, whereas the same disturbing effect of the same encounter might be turned to account as a supreme opportunity for an act of spiritual creation by evangelists who came to bring, not a sword, but peace, and who found their mission, not in striving to make one of two colliding cultures prevail over the other, but in seeking to make the challenge of an encounter yield the response of a new spiritual vision opening up the vista of a new way of life.

If this was indeed the truth, then the World's first need on the political plane in the sixth decade of the twentieth century of the Christian Era was a *détente* between the United States and the Soviet Union in the spirit of the *détente* which, at an equally critical moment of Hellenic history, the Roman and the Arsacid Power had jointly achieved in 23-20 B.C.—to their common credit and to the general benefit of a world whose fate had lain in the hands of those two Powers between them. In 23-20 B.C. the Roman and Arsacid governments virtually agreed to partition between them, *uti possidebant*, an Hellenic World which had been expanded by previous Macedonian conquests to embrace a Hittite, Syriac, Egyptiac, Babylonian, and Indic Society's domains in addition to the Hellenic Civilization's own patrimony.¹ Augustus was abandoning a Roman aspiration—inspired by a consciousness of Rome's decisive superiority over Parthia in military resources, and entertained since the year 53 B.C. by Crassus, Julius Caesar, and Mark Antony in succession—to reassert by force of Roman arms, as far eastward into the heart of the Continent as Alexander the Great had ever penetrated, an Hellenic ascendancy that, in the course of a century ending in 53 B.C., had been all but extinguished east of the Euphrates. In return for this tacit assurance that Rome was now renouncing an ambition whose achievement would have required the overthrow and destruction of the Parthian Empire, the Arsacid Government was now making it possible for Rome to forget her rankling resentment at the humiliating defeat of an aggressive Roman military adventure by giving back the captured standards and releasing the surviving prisoners of war that had been the trophies of a Parthian victory over an invading Roman army thirty years back.

It is true that the Romano-Parthian *détente* of 23-20 B.C. did not eliminate all the friction from the relations between the two surviving Powers in a war-stricken Hellenic World. For another four centuries and more, Rome and Ctesiphon were to contend for the prize of paramountcy over a buffer state in Armenia which was to play the part played by Afghanistan in the relations between the British and Russian empires in the nineteenth century of the Christian Era. There were

¹ The outlying Indian province of this expanded Hellenic World was the only fraction of it which, at this date, was not under either Arsacid or Roman rule.

also to be other bones of contention between Rome and Parthia besides Armenia, and these divers chronic disputes were to erupt into occasional wars. Nevertheless, the *détente* of 23–20 B.C. was as auspicious as it was historic; for it set a tone which governed the relations between the Roman Empire and its eastern neighbour on the whole for not much less than six hundred years thereafter;¹ and the tradition of moderation that thus came to prevail in the relations between the western and the eastern Power in a partitioned Hellenic World was not easily overcome by the deliberately banned spirit of militancy.

When Trajan strained Roman resources almost to breaking-point by reverting to the Alexandrine Oriental ambitions of Mark Antony, Caesar, and Crassus, the Augustan policy of self-restraint was promptly readopted by Trajan's immediate successor Hadrian; and, after this Hadrianic liquidation of a Trajanic adventure, a 'temperate and undecisive' border warfare that continued occasionally to interrupt a normal state of peace was not converted into a holy war either by the hold that Zoroastrianism gained over the later Arsacid princes of the Parthian line or by their Sasanid successors' act of officially establishing the Zoroastrian Church as the state church of their empire. The friction between the Roman trustees of Hellenism and the Iranian trustees of a temporarily submerged but never extinguished Syriac Civilization did not rankle into a life-and-death struggle until the two Powers fell into the reduplicated Romano-Persian war of A.D. 572–91 and A.D. 603–28; and it was only in the course of the second of the two bouts of this long-drawn-out struggle that a political conflict came to be inflamed into an ordeal by battle between the fanatical adherents of two rival faiths.

In the particular social circumstances of a Westernizing World in the twentieth century of the Christian Era, in which time was needed for the breeding of familiarity, the danger of an atomic world war, which loomed large in A.D. 1952, might be expected to recede if American and Russian statesmanship could contrive to keep the peace even for a much shorter period than the time for which it had been kept between the Roman and Parthian empires in virtue of the *détente* of 23–20 B.C.; but in this case, as in that, the task of statesmanship would not be easy.² A consideration that seemed likely to tell in favour of a preserva-

¹ From first to last the Euphratean frontier of the Roman Empire endured for nearly seven hundred years, running from Pompey's organization of the province of Syria in 64 B.C. to the irruption of the Primitive Muslim Arab barbarian invaders into the Roman and Sasanian empires simultaneously in and after A.D. 632 (see I. i. 75).

² Professor William McNeill comments: 'I feel that the Rome-Carthage relationship is a far more convincing parallel to contemporary conditions than the Rome-Parthia relationship. In the relations between Rome and Parthia mortal fear and the density of contact were, I believe, absent.' The present writer's comment on this comment is that it was not too much to expect of American and Russian statesmanship in the sixth decade of the twentieth century of the Christian Era that it should stabilize the relation between the United States and the Soviet Union on a Romano-Parthian basis and save it from degenerating into a Romano-Carthaginian 'irrepressible conflict'. Some of the obstacles to the achievement of the statesmen's task in the encounter between the United States and the Soviet Union are examined in the remainder of this chapter. These obstacles were manifestly formidable. Yet the present writer would submit that, when the obstacles had been looked in the face and had been estimated at their highest possible magnitude, it would still be a culpable surrender to despair—or, more culpable still, to mere impatience—if the statesmen were to resign themselves to the conclusion that a

tion of the peace was the current disparity between the two Powers' respective military resources.

In an age in which the sinews of war were technological and organizational experience and ability commanding man-power and non-human raw materials in quantities sufficient to ensure a full investment of the fund of human skill, the United States possessed in A.D. 1952 a superiority, in potential military strength, not only over the Soviet Union and her satellites, but over the whole World outside the United States' own frontiers;¹ and, though this present American superiority might, as has been noted,² be diminished, or even eventually converted into an inferiority, if the Russians were ever to succeed in fully developing the latent resources of the Soviet Union and in gaining effective control over the developed and latent resources of the rest of the Old World, the United States' present superiority seemed likely to last as far into the future as it was possible to see ahead, since the fund of skill which was the key to industrial power was, in the nature of things, an asset that it would take the Russians much longer to build up than material resources that could be converted into military strength only to the extent to which the skill to exploit them was forthcoming.³

On this showing, the present disparity between the United States and the Soviet Union in potential military strength seemed likely to endure. Yet it would have been rash to jump, on this account, to the conclusion that the Soviet Union would be willing or able in all circumstances to refrain from challenging her rival's decisively superior potential strength; for the competition between Rome and Parthia for paramountcy over Armenia after the *détente* of 23-20 B.C., and the competition between Athens and the Peloponnesian Confederacy for the accession of Corcyra after the peace settlement of 445 B.C., were warnings that, in any society that was partitioned politically between two Powers, and two only, a Balance of Power, even when this had been deliberately established by overt or tacit agreement, was in constant danger of being upset, even against the parties' will, by their falling into an involuntary yet unavoidable competition for the allegiance of forces, hitherto neutral, whose added weight might be expected to give the scales a decisive inclination to one side or the other—whichever of the two sides should succeed in securing this accession of strength for itself.

third world war could not be averted by a saving combination of the spiritual forces of wisdom, good will, and, above all, forbearance.

¹ Professor William McNeill comments: 'United States superiority is less than statistics of steel production would suggest, since, in the United States, more effort and material has to be devoted to civilian consumption, and more of military man-power and supply to services, than is required in the Soviet Union, where the lowness of the people's standard of living and the hardihood of their spirit makes them able to live and fight on a much smaller allowance of comforts and amenities than is demanded by Americans.'

² On pp. 488-9, above.

³ 'Les atouts actuels de l'Europe ne paraissent pas reposer sur des nécessités physiques, mais sur un acquis historique qui ne peut lui échapper que par une évolution prolongée, et sur les qualités morales et intellectuelles de ses populations. Notre civilisation sur-industrialisée ne peut avoir d'autres centres que l'Europe et les États-Unis, tant que les autres régions n'ont pas atteint le même degré de surindustrialisation, donc de technique, de capitalisation, de standard de vie; les courants ne peuvent donc être détournés que très insensiblement' (Dupriez, L. H.: *Les Mouvements Économiques Généraux* (Louvain 1947, University Press, 2 vols.), vol. i, p. 380).

In a twentieth-century *Oikoumenê* that, since A.D. 1947, had been virtually partitioned into an American and a Russian sphere of influence, there were at least two pawns on the board that imperilled the maintenance of peace between the two rival Powers through being assets on which neither Power's hold was secure, and consequently being objects for which the two Powers were bound to compete. One of these disputable assets was the industrial war-potential of Europe, which at this date amounted in the aggregate—including the Russian as well as the American sphere of Europe—to more than a quarter of the total industrial war-potential of the World; the other disputable asset was the man-power of the non-Western and non-Russian peasant countries in Asia, Africa, and Indian America (from Mexico to Paraguay inclusive), which amounted in the aggregate to about three-quarters of the living generation of Mankind. In A.D. 1952 each of these two assets was partly in American and partly in Russian hands; if either of them were to fall wholly into the hands of only one of the two competitors for possession, the effect might be to give the Russo-American balance a decisive inclination in the successful competitor's favour; and, in either field, the hold of one of the two competitors was precarious. While the United States had good reason for fearing that the secession of China from the American to the Russian camp in A.D. 1948-9 might be followed by further landslides in the same direction in other Asian or African countries, the Soviet Union had no less good reason for fearing that she might not be able permanently to retain her control over those eastern fringes of the Western Society's Continental European patrimony on which she had imposed her domination during the last phase of the Second World War. Thus either Power was vulnerable, on one of two critical fronts, to the danger of formidable encroachments at its expense on the rival Power's part; and the consequent instability of the current balance made it difficult to hold the political scales even, and proportionately difficult to keep the political temperature low.

A Russian observer, drawing an interim balance sheet in A.D. 1952, and entering in his credit column the accession of China over against an entry in his debit column recording the defection of Yugoslavia, might find it hard to say whether, on balance, the Soviet Union had been a loser or a gainer. If the triumph of Communism in China were indeed an augury of what was to come in the South-East Asian countries, in India, in Pakistan, in Persia, and in an Arab World extending westward from the oil-fields of 'Irāq and Sa'ūdī Arabia to the Atlantic seaboard of Morocco, this might seem in Russian eyes to be a winning card on a long view; for, in a competition for the allegiance of all Mankind between Communism and a traditional Western way of life, the suffrages of a peasant three-quarters of Mankind might be expected to be the determining factor in the long run; and, in appealing to this vast primitive electorate, Russia enjoyed advantages that America lacked.

The chief of these Russian advantages was that Russia herself, till yesterday, had been one of the primitive peasant countries at the mercy of a Western Society which had outstripped the rest of the World in its technological progress; and that, since yesterday, Russia had

discovered a method of catching up with the Westerners by a forced march, and had by this means transformed her own economy at short notice with a success that had been registered in her victory in the Second World War over a Germany who, next to the United States, had been the strongest industrial Power in the Western World of the day. The Russians could thus use their own striking technological achievements under a Marxian dispensation as an impressive argument when they were commending Communism to other peasant peoples who still found themselves in the Russians' pre-Stalinian, or even in their pre-Petrine, plight of individual poverty and collective impotence. Russian propagandists could appeal in the same breath to an ancient Asian peasantry's new aspiration to raise its standard of living, and to a parvenu Asian intelligentsia's aspiration—which was as old and as young as this intelligentsia itself—to make itself mistress in its own house by throwing off the ascendancy of Western intruders who, for their own purposes in Asia, had called this Asian intelligentsia into being.¹

At this point an alert Western counter-propagandist might try to put a spoke in the Russian propagandist's wheel by pointing out to the Asian intelligentsia that in reality the Russians were inviting them to exchange a Western ascendancy for a Russian ascendancy, and not for the national independence that the Russians were dangling before Asian eyes, and by simultaneously pointing out to the peasantry that in reality the Russians were inviting them to exchange the familiar woes of rack-rented tenants, not for the utopia of peasant proprietorship, but for the prison-house of a mechanized collective farm.² Such home truths, however, were likely to fall on deaf ears. The Asian peasants would not easily be deterred from making the common human blunder of exposing themselves to hitherto unknown evils in their eagerness to escape the known evils from which they were suffering at the moment. As for the Asian intellectuals, they might pay heed to a Western warning against a Russian imperialism if they happened to be natives of Manchuria, Outer Mongolia, or Soviet Central Asia, where this warning would evoke an echo in their memory of their own experience; but the voice of this handful of land-locked intellectuals would not carry far. In the experience of an overwhelming majority of the Asian intelligentsia of the day the typical alien imperialist was not a Russian; he was an Englishman, a Frenchman, a Dutchman, or some other variety of Frank. For the past 450 years the West European conquerors of the Ocean had been taking advantage of the conductivity of their physical medium of aggression to perpetrate indiscreet *actes de présence* in every corner of the *Oikoumenê*—'going to and fro in the Earth, and . . . walking up and down it'³ with the assiduity of Satan himself. These ubiquitous Western mariners' Cossack contemporaries who had made the toilsome trek overland from the Urals to the Sea of Okhotsk had contrived hitherto to commit their aggression less conspicuously. In A.D. 1952 the Russian imperialist, in his missionary warfare with the Western imperialist, enjoyed the advantage of being relatively unknown

¹ See V. v. 154-8.

² See IX. viii. 674-5.

³ Job ii. 2.

that had sometimes proved to be a winning card in American presidential elections. At this date the Russian candidate for the spoils of Imperialism was no more than a specious name to most of the peoples to whom Imperialism was now anathema.

By contrast, Eastern Europe was a region where, for the last two hundred years or so, the Russians had been acquiring the self-same bad reputation that, in the world at large, had been pre-empted by the Franks; and in A.D. 1952 a Russian observer, contemplating the entry of Yugoslavia's name on the debit side of his balance sheet, must have been ruefully conscious of Russia's weakness in this quarter. If Slavonic-speaking ex-Orthodox Serb Communists had broken with Slavonic-speaking ex-Orthodox Russian Communists—whose support was of vital importance to Yugoslavia in her dispute with the Western Powers over Trieste—because they could not bear the domineering behaviour of the Soviet Union Communist Party, how could the Soviet Union hope to win any voluntary adherents anywhere in Eastern Europe, or hope permanently to retain her hold on any East European countries if once she found herself reduced to holding them down by sheer physical force? The ominous symptom here, from Russia's point of view, was her unpopularity in East European countries that, as peasant countries, as Orthodox Christian countries, and as Slavonic-speaking countries, ought, on any *a priori* ideological theory, to have felt themselves drawn towards the Soviet Union rather than towards the West.

An Orthodox Christian Georgia, for example, had not been reconciled to Russian rule by the freak of chance that had saddled Russia with a Georgian dictator; a Bulgaria that was Slavonic-speaking as well as Orthodox Christian was apparently as recalcitrant to Russian domination in A.D. 1952 as she had shown herself to be on the morrow of her liberation from Ottoman rule by Russian arms in A.D. 1878; Slavonic-speaking Bosniak Muslims and Croat and Slovene Catholic Christians, who were apt to resent their Serb fellow Yugoslavs' ascendancy, had followed the Serbs' lead with alacrity in the stand that the Serbs had now taken against a Communist Russian imperialism. The Czechs had once looked confidingly to their Russian fellow Slavs to rescue them from the toils of Pan-Germanism; they had cherished this hope all through a century ending in A.D. 1945 with the arrival of a liberating Russian army in a Bohemia that, since the 15th March, 1939, had been a Third German Reich's 'Protectorate'; but the same Czechs had been quickly cured of their sentimental attachment to Russia by the experience of meeting Russians in the flesh in the role of representatives of an officially benevolent occupying Power. As for the Poles, the Magyars, and the Finns, History had demonstrated, long before A.D. 1945, that the Russians had no chance of reconciling them, and *a fortiori* none of assimilating them. The outcome of the Russian Empire's suzerainty over Finland from A.D. 1809 to A.D. 1918, and of her dominion over 'Congress Poland' from A.D. 1815 to A.D. 1915, indicated that a Slavonic-speaking Catholic Poland and an Ugrian-speaking Lutheran Finland were, both of them, proof against any attempts at Russification. As for the Ugrian-speaking Catholic and Calvinist Magyars, Russia had been

their bugbear since A.D. 1849, when her military intervention in support of a Hapsburg Imperial Government at bay had enabled the Emperor Francis Joseph to put down a Magyar national insurrection with which he had been finding himself unable to cope unaided. After the Austro-Hungarian *Ausgleich* of A.D. 1867 Russia had come to figure in Magyar, as in Czech, imaginations as the champion of Pan Slavism; and, when invading Russian armies had arrived in Hungary in A.D. 1945 as the champions of Communism instead, this had not, of course, mollified the Magyars' by that time traditional Russophobia.

Nor could the Russians look forward to offsetting their general unpopularity in Eastern Europe by establishing an advanced post for Communism in Eastern Germany; for, in East German as well as West German minds, the Russian régime was bound to be abhorrent on account of its association with the partition of Germany, like Korea, between a Russian and an American hemisphere and with the annexation of Germany's eastern marches to Poland as far west as the Oder-Neisse Line. In the feelings of all Germans under all régimes after the Second World War, the Soviet Zone of Germany and the German territory annexed to Poland might be expected to fuse together into a monumental *Germania Irredenta*.

Thus, in a world that had been partitioned between the Soviet Union and the United States in A.D. 1947, either Power's hold on important portions of its provisional domain was decidedly precarious; this element of uncertainty made the current Russo-American Balance of Power unstable; this instability was inimical to the statesmen's task of keeping the peace until mutually alien societies, which the progress of Technology had suddenly brought into close quarters with one another, should have had time to become better acquainted; and, though the length of time required for allowing this psychological adjustment to work itself out seemed unlikely to be of the order of magnitude of the six centuries for which the Romano-Iranian frontier had endured after the Augustan *détente* of 23-20 B.C., it was nevertheless evident that a long period of precarious peace would be needed before there could be any practical possibility of placing this peace on the surer foundation of a genuinely good understanding between the Russian and the Western camp.

In the Western peoples' experience, in their intercourse with one another, the key to collective friendships between nations had been individual friendships between human beings whose personal comprehension of one another and goodwill towards one another had spun a network of human links across the psychological barriers set up by politico-military frontiers. In the light of this Western experience the Soviet Union's Western allies had taken the initiative, before the close of the Second World War, in proposing arrangements on a large scale for the promotion of personal intercourse between her nationals and theirs—especially in the promising form of an interchange of students. In the Westerners' belief it was not their fault that these overtures had not met with any response on the Russian side. They deplored the Soviet Government's evident unwillingness to let its subjects take

advantage of these opportunities that were being offered to them of sampling the Western way of life at first hand for themselves; and, while they read in the Soviet Government's opposition to their proposals for intercourse a lack of confidence in the spiritual power of Communism to hold its own against the contemporary Western way of life in the judgement of Soviet citizens, if these were once given a chance of making a comparative personal trial of the two dispensations, this reading of the motives inspiring the Soviet Government's policy of seclusion was no comfort for those Westerners who saw no salvation for the World except in the achievement of a *détente* between the Western Society and its Russian neighbour. If the Politburo's belief in the hold of Communism upon the hearts and minds of Soviet citizens were ever to become robust enough to outweigh the Soviet Government's fear of allowing their subjects to see the Western World for themselves, then (so it would appear to Western minds) a positive approach would have been made towards the healing of a spiritual schism that was a menace to the prospects, not merely of the Western Civilization, but of Mankind itself, not excluding the garrison of a Communist camp.

In circumstances that were so plainly precarious but in other respects so enigmatically obscure, a dogmatic optimism was as unwarrantable as a dogmatic pessimism, and the living generation of Mankind had no choice but to reconcile itself as best it could to the disturbing knowledge that it was facing issues in which its very existence might be at stake, and that it was at the same time impossible at this stage to guess what the event would be.

In A.D. 1952 these perennial waifs on board Noah's Ark were in the situation in which Thor Heyerdahl and his five fellow vikings on board a balsa-log raft found themselves on the morning of the 7th August, 1947. On that fateful morning a westward-flowing current that had borne the raft *Kon-Tiki* 4,300 nautical miles across the breadth of the Pacific Ocean was now carrying her towards the Raroia Reef. Beyond the line of surf breaking over this barrier the approaching seafarers could descry the feathery tops of palm trees, and they knew that these palms bedecked idyllic isles set in a still lagoon; but between them and this haven where they would be¹ ran the foaming and thundering reef 'in one line from horizon to horizon',² and the set of the current and the wind gave the voyagers no chance of circumnavigation. They were heading perforce towards an inevitable ordeal; and, though they might know what were the alternatives awaiting any voyagers in this plight, they could not guess which of these alternatives was to be the ending of their own saga.

If the raft were to be broken up by the breakers, the crew would be torn to pieces by the knife-edged coral if they were not saved by speedy drowning from that more painful death. If the raft were to hold together, and if its crew were to succeed in holding on to it, until the breakers had defeated their own malice by washing the raft up on to the reef

¹ Psalm cvii. 30.

² Heyerdahl, Thor: *Kon-Tiki* (Chicago 1950, Rand McNally), p. 242.

high and dry, a shipwrecked crew might swim across the still lagoon beyond, and so reach one of the palm-crowned isles alive. If the moment of the raft's arrival at the reef should happen to coincide with the flood of one of those high tides that periodically submerged the reef to a depth that compelled the breakers temporarily to subside, the *Kon-Tiki* might, after all, clear the death-line in calm water, and so come through unscathed. In the event, a high tide did flow in to lift her battered frame off the reef into the lagoon¹ some days after the surf had cast her up on to a bare coral crest; but on the morning of the 7th August, 1947, no man on board the *Kon-Tiki* could tell which of these alternative destinies was going to be hers and theirs.

The experience of these six young Scandinavian seafarers on that day was an apt allegory of an ordeal that still lay ahead of Mankind at the opening of the second half of the twentieth century of the Christian Era. In A.D. 1952 an Ark of Civilization that had travelled a time-distance of some five or six thousand years across the ocean of History was now making, like the *Kon-Tiki*, for a reef which its crew would not be able to circumnavigate. This unavoidable danger ahead was the perilous line of transition between a world partitioned into an American and a Russian sphere and a world united under the control of the single political authority which, in an age of atomic weapons, must supersede the present division of authority sooner or later in one way or another. Was the eventual transition to be pacific or catastrophic, and, if catastrophic, how dire was the catastrophe to be? In A.D. 1952 no one in the World could foreknow the outcome of the ordeal towards which the World was then manifestly moving. One thing alone was certain, and this was that the spirit in which an inevitable ordeal would best be met was the spirit shown by Thor Heyerdahl and his companions at the moment when the *Kon-Tiki* struck the Raroia Reef.

(IV) POSSIBLE CONSTITUENT ELEMENTS OF A FUTURE WORLD ORDER

Without waiting for a facile wisdom after the event, an observer of world affairs in A.D. 1952 might perhaps usefully speculate on the shape of things to come so long as he confined his consideration of a future world order to elements that an oecumenical dispensation seemed likely to have in common with each of the two demi-mundane dispensations that had been crystallizing round the United States and round the Soviet Union since A.D. 1947.

If the construction of a world order had depended on the Technology in which Man was so accomplished an adept, and not on the Human Nature that Man found it so difficult to govern and guide, Mankind in A.D. 1952 could have contemplated the future with complacency; for a simultaneous coalescence and shrinkage of the *Oikoumenê* that had made it more dangerous than ever before to go on waging war had also made it less difficult than ever before to put Mankind in a position to preserve the peace by finding technological solutions for the administrative prob-

¹ See Heyerdahl, op. cit., pp. 273-4.

lem of bringing the whole of the *Oikoumenê* under the undivided control of a single oecumenical government.

In terms of facilities for human intercourse no point in the *Oikoumenê* was so remote from Washington in A.D. 1952 as Georgia and New Hampshire had been when, in A.D. 1792,¹ the Congress of the United States had provided for a four months' delay in the inauguration of a President after the election of his electors, in order to give the successful candidate the time that he would need for winding up his affairs at home and making his way to the seat of the Federal Government on horseback. For purposes of human intercourse the United States at the time of its establishment was of about the same size as the Achaemenian Empire in the fifth century B.C., when it took three months to travel to Susa, the imperial capital, from Ephesus, the Aegean terminus of the Great North-West Imperial Highway;² and the Roman Empire may be reckoned to have been of about the same size in human terms, if we may assume that the centurion who took charge of Saint Paul after the Apostle had appealed to Caesar would not have taken more than three months in conveying his prisoner from the Palestinian port of Caesarea to the Italian port of Puteoli if he had been able to book a direct passage and if he had been less unlucky in his weather.³ In A.D. 1952 three months seemed an inordinate length of time to allow for any journey imaginable. Yet the Roman Empire, the Achaemenian Empire, and the United States in her pre-railroad age were effectively administered commonwealths, though in each of them a period of three months had to be allowed for making the journey from the frontier to the capital; and, in this pre-railroad age, a Darius, Alexander, Demetrius, Caesar, Constantine, and Napoleon were able repeatedly to confound their antagonists by the speed at which they managed to dart from one extremity to another of an *Oikoumenê* whose radius, in human terms, was a three months' journey for ordinary official travellers, and a proportionately longer time than that for anyone not entitled to travel by the public post.

While in point of conductivity an eighteenth-century United States had been a polity of the same order of magnitude as the Roman or the Achaemenian Empire, in point of constitution it had been more ambitious. In contrast to the Roman and Achaemenian imperial régimes, which had been content to impose upon their subjects an authoritarian government maintained by a professional army and administered by a professional civil service responsible to an individual autocrat, the Constitution of the United States had provided for democratic government in a polity of the Roman or Achaemenian size by combining the Medieval Western device of parliamentary representation of an electorate with the

¹ In an Act approved on the 1st March, 1792, the Congress of the United States laid down that the members of the Electoral College, provided in the Constitution (Art. II, § 1, par. 2) for electing the President, should themselves be elected on the Tuesday following the first Monday in the November of a presidential election year, and that the term of office of the President elected by the Electoral College should run from 'the fourth day of March next succeeding' the date of election. The initial date of the President's term of office was eventually advanced from the 4th March to the 20th January by the Twentieth Amendment to the Constitution, which was proclaimed on the 6th February, 1933—a date by which the United States had moved out of the Horse Age through the Railroad Age into the Air Age.

² See VI. vii. 82, n. 1.

³ See Acts xxvii. 1–xxviii. 16.

Hellenic device of federalism. A representative system in which the people's control over the government was exercised at one remove would, no doubt, have seemed an anaemic dilution of Democracy to citizens of city-states like Florence or Athens, for whom Democracy had signified the direct participation of all the citizens in public affairs; and, for the sake of making a reality of this political ideal, most of these Hellenic and Medieval Western democracies had been content to see the size of their commonwealths limited for ever to the maximum within which a direct participation of the whole citizen body in the government was still practicable. When this was taken as the touchstone for testing the genuineness of Democracy, a country with the area and population of Attica in the fifth century B.C. was the largest that could be governed democratically in the Athenian and Florentine sense; for in Attica the points farthest from the capital—an Eleusis, a Marathon, a Sunium—were none of them farther away from Athens than a single day's journey on foot,¹ while a citizen body that, at a maximum estimate, may have approached a total strength of sixty thousand at its peak,² was unlikely, except on rare occasions, to present itself on the Pnyx in such force as to make the conduct of public business unmanageable.³

¹ On the 10th December, 1911, four students of the British Archaeological School at Athens, one of whom was the writer of this Study, verified this by walking from Sunium to Athens between the dawn and the dusk of a winter's day. Starting from Sunium at 6.30 a.m., our party reached Athens as night was falling. We should have arrived in daylight if, when approaching Vári, we had not wasted an hour or so by swerving off the track and scouring the south-eastern spurs of Hymettus in a vain search for the Cave of Pan. A citizen of fifth-century Athens whose home was at Sunium, Marathon, or Eleusis would, no doubt, have had to spend at least one night in the capital when he made the journey thither on foot in order to transact business there.

² That is, if M. N. Tod, in *The Cambridge Ancient History*, v (Cambridge 1927, University Press), p. 11, is right in interpreting *ἡλικίᾳ* in *The History of the Atheno-Peloponnesian War*, Book II, chap. 13, to mean that the total number of male Athenian citizens of all classes, of the age of eighteen years and upwards, was something between 55,000 and 61,000 in 431 B.C. Whatever the figure actually was in 431 B.C., it may have been higher before 445 B.C., when some 5,000 men were struck off the register in execution of a law, passed in 451-450 B.C., restricting the Athenian franchise to the children of married couples in which both parents had been Athenian citizens at the time of the child's birth. We do not know the extent to which this reduction of the total by 5,000 in 445 B.C. had been offset by natural increase during the next fourteen years.

³ In composing their nostalgic political utopias, in which Sparta was their ideal and Athens was their bugbear (see III. iii. 90-91), Plato and Aristotle agreed with one another in setting the optimum number of citizens of a city-state at a figure that was very much lower than the actual numerical strength of the Athenian citizen body in their day, when its strength was considerably smaller than it had been at its peak. In the *Republic* (423 A-D) Plato declares that, so long as his ideal city-state has the constitution that he has laid down for it, he does not mind if the number of citizens capable of bearing arms is no more than 5,040, and he stipulates that, if the number is to be higher than that, it must not be raised to a figure at which the community will lose its unity. In *The Laws* (737 C-738 A) Plato takes as his criterion for the scale of his ideal city-state the need for the community's man-power to be sufficient to enable it to defend itself successfully if attacked by its neighbours, and on this criterion he opts for a figure of 5,040 citizens capable of bearing arms. Aristotle, in his discussion of the optimum magnitude in *The Politics* (1225 B-1226 B), refrains from committing himself to any precise figure and merely stipulates that the number of the citizens must not be so large as to make it impossible for them to be all personally acquainted with one another, or impossible for an announcer without a loud-speaker (*κῆρυξ ἢ Στενόρροπος*) to make himself heard by the whole assembly. A popular assembly even of this size would, of course, have been unmanageable if it had been the only organ of government. In a competently managed Hellenic democracy such as the Athenian in the sixth and fifth centuries B.C., the popular assembly was enabled to transact its business effectively thanks to an infusion of the representative system into the Cleisthenean Constitution of 508-507 B.C. Public business was pre-digested and presented, and its

The size of the territory of the Roman Commonwealth was perhaps hardly more than a third of the size of the territory of a contemporary Athens at the time when, at some date in the fifth century B.C., the Ager Romanus was divided into twenty districts in order to articulate a national popular assembly into as many companies of voters, each consisting of the citizens whose domicile lay in one of these 'tribal' districts;¹ and the maximum distance that any Roman citizen would have to travel from his home to the capital in order to take part in national public business remained well within Attic limits even after the territory of Rome had been enlarged by the addition of one new district (the Tribus Clustumina) up the left bank of the River Tiber² and four further new districts into which the territory of Veii, across the Tiber, was subsequently carved up after its conquest in 396 B.C.³ When in 358 B.C. two more districts (the Pomptina and the Publilia) were carved out of conquered Volscian territory⁴ in the lowlands south-east of the Alban Hills, Roman citizens now resident there might find it still just possible to

subsequent transaction in the popular assembly was controlled, by a grand jury, or general purposes committee, of the citizen body which was, not elected, but picked by lot, on a representative system in which the quota allocated to each local administrative district of Attica was proportionate to the fraction of the total citizen body that was estimated to be represented by the citizens resident in that district. Since this committee (the *Boulê*) was itself five hundred strong and was therefore, like the general assembly, too unwieldy to dispatch executive business in plenary session, it was divided into ten sections, which took it in turns to serve as an executive sub-committee for periods of thirty-six or thirty-five days each within the *Boulê's* twelve months' term of office. This executive sub-committee had a chairman, picked by lot, who changed every twenty-four hours. The task of presiding over meetings of the *Boulê* and of the general assembly was entrusted to a presidential body of nine members, picked by lot *ad hoc*, with a chairman of their own, likewise picked by lot, from the nine sections of the *Boulê* that were not serving as the executive sub-committee at the moment (see Aristotle: *The Constitution of Athens*, chaps. 43-44).

¹ The date of the division of the Ager Romanus into the twenty 'tribal' districts is discussed by K. J. Beloch in his *Römische Geschichte bis zum Beginn der Punischen Kriege* (Berlin and Leipzig 1926, de Gruyter), pp. 270-1 and 298-302. The only certain chronological facts are that these first twenty 'tribal' districts must have been instituted before the addition of a twenty-first (the Clustumina), and that the territory of Crustumium, out of which this twenty-first district was constituted, must have been annexed to the Ager Romanus before the annexation, in 396 B.C., of the territory of Veii, on the opposite bank of the river, which was subsequently carved up into four more districts (the twenty-second to the twenty-fifth inclusive). It can also be deduced from the lie of the land that the territory of Fidenae, along the left bank of the Tiber between the territory of Crustumium and Rome, must have been annexed to the Ager Romanus before the annexation of Crustumium, and Beloch (in op. cit., pp. 298-302) gives reasons for thinking that Fidenae was conquered by Rome in either 428 B.C. or 426 B.C. We do not know, however, whether this conquered Fidenate territory was included in one of the first twenty Roman 'tribal' districts or in the twenty-first district, i.e., the Clustumina.

Even, however, if the Ager Fidenas was already included in the Ager Romanus at the date at which the original twenty Roman 'tribal' districts were instituted, the aggregate area of the Ager Romanus at the time would have been no more than 861.5 square kilometres, as against 822 if at that time Fidenae was still independent (these figures will be found in Beloch, op. cit., p. 178). On the other hand the area of Attica, within her frontiers as they ran in the fifth century B.C., was as much as 2,440 square kilometres according to Beloch's reckoning in his *Die Bevölkerung der Griechisch-Römischen Welt* (Leipzig 1886, Duncker and Humblot), p. 56, if we include the island of Salamis, which had been colonized by Athenian citizens, but omit the two districts of Oropus and Eleutheræ, adjoining the land-frontier between Attica and Boeotia. Thucydides describes the Oropians as 'subjects of Athens' (Book II, chap. 23; cp. Book IV, chap. 99), while it is not certain that the Eleutheræis possessed the full Athenian franchise (the status of the inhabitants of these two districts is discussed by G. de Sanctis in his *Atthis* (Turin 1912, Bocca), p. 333, n. 1).

⁴ See *ibid.*, pp. 265 and 356-8.

exercise their public rights and duties in the capital by making, within the day, a journey that was rather longer than the journey from Sunium to Athens. This physical feat would certainly have been practicable for Roman citizens domiciled in two other new districts (the Maecia and the Scaptia) that were carved in 332 B.C.¹ out of territory, ceded to Rome in 338 B.C. by the Confederation of Latin City-States, between the two previously acquired outlying districts in the Pomptine Marshes and the metropolitan domain of the Roman Commonwealth containing the original twenty districts. A Roman citizen domiciled in another new district (the Oufentina), carved in 318 B.C. out of territory, ceded to Rome by Privernum,² in the Pomptine Marshes south-east of the two districts established there in 358 B.C., might have been able to reach Rome within the day by an athlete's *tour de force*; but the task would have defeated the classical Athenian long-distance runner Philippides himself if Philippides had been a Roman citizen domiciled in a district (the Falerna) that had been constituted in 332 B.C.³ out of territory, ceded to Rome by Capua along the north bank of the Lower Volturnus, more than a hundred miles away from Rome as the aeroplane flies;⁴ and, when in the course of the years 268–241 B.C. the territory inhabited by Roman citizens legally invested with the active rights of citizenship was progressively extended from the northern environs of Rome northward across the Appennines to the shores of the Adriatic, and when these fully enfranchised Sabines and Picentes were enrolled in 241 B.C. in a newly created Tribus Quirina and Tribus Velina,⁵ the territory of the Roman Commonwealth flagrantly burst the bounds within which it was physically possible for every citizen to participate in the national government directly.

Thus, long before the time when the Roman Empire became co-extensive with the Hellenic World, and when local communities of transplanted or naturalized Roman citizens were scattered all over the territory of this Roman-built Hellenic universal state, an ever increasing majority of the total Roman citizen body had come to find itself unable in practice to exercise its rights and duties in the forum of Roman national politics simply because its domiciles were too far distant from a capital city that was the only place where, under Rome's city-state constitution, national public business could legitimately be transacted.⁶

³ See *ibid.*, p. 388.

⁴ The writer flew over this stretch of country, from Ostia to the gap between Terracina and Monte Circeo, on the 28th October, 1948, after having traversed it by train on the 14th November, 1911.

⁵ See Beloch, *op. cit.*, p. 265; eundem: *Der Italische Bund unter Roms Hegemonie* (Leipzig 1880, Teubner), pp. 76 and 122–3.

⁶ As late as A.D. 69, when the *Pax Augusta* was a century old, and when a quarter of a millennium had passed since the date when Rome had made herself virtually mistress of the Hellenic World by overthrowing Macedon, the last other Hellenic Great Power capable of challenging Rome's supremacy, the Roman public was surprised at the discovery that the post of autocrat in constitutional disguise (*princeps*), which had long since become an indispensable organ in the government of the Roman Commonwealth, could be filled by a pronunciamiento on the part of Roman citizens serving in the garrisons of the imperial frontiers ('*Finis Neronis . . . varios motus animorum non modo in urbe apud patres aut populum aut urbanum militem, sed omnes legiones ducesque conciverat, evulgato imperii arcano posse principem alibi quam Romae fieri*' (Tacitus: *Histories*, Book I, chap. 4).

These outlying Roman citizens had to satisfy their Hellenic craving for direct participation in the government of a city-state by participating in the local government of the *praefectura*, *forum*, *conciliabulum*, *colonia Romana*, or *municipium* of which they were also citizens under a Boeotian system of dual citizenship that had been adopted by the Roman Commonwealth as well as by its post-Alexandrine contemporaries the Seleucid Monarchy and the Aetolian and Achaean confederacies;¹ but this municipal franchise was no compensation for the virtual disfranchisement that had been inflicted on them in the forum of Roman national politics, not by any narrow-hearted policy of making the control of the Roman national government a monopoly of a metropolitan minority of the citizen body,² but by the inability of pre-mechanical means of communication to enable the outlying citizens of the Roman Commonwealth to put in an appearance in the capital city when the territory inhabited by Roman citizens had become as extensive as it had actually come to be some two or three centuries before the Emperor Tiberius, upon his accession in A.D. 14, at last took cognizance of the stultification of Rome's city-state constitution by her territorial expansion in the long since overdue act of liquidating the anachronistic Roman national popular assemblies in the capital city.

It was, in fact, technologically impossible for the Roman citizen body in the first century of the Christian Era—and *a fortiori* in the third century, after the enfranchisement of almost all Rome's alien subjects in A.D. 212 by the Emperor Caracalla (*imperabat* A.D. 211-17)³—to take, in the government of a Pan-Hellenic Roman Empire, the direct part that the Athenian citizen body in the fifth century B.C. had been able to take in the government of Attica; and this would likewise have been impossible in the eighteenth century of the Christian Era for the citizen body of a United States whose populated territory was then still confined to the eastern seaboard of North America between the Atlantic and the Appalachian Mountains. On the other hand, by A.D. 1952 the progress made by Western technology within the 177 years that had elapsed since the Declaration of Independence had, in terms of human intercourse, reduced to the dimensions of a Periclean Attica a United States that now stretched from coast to coast of the North American island. On the 10th October, 1950, it took the writer of this Study a shorter time, by four hours, to fly from New York to Los Angeles than it had taken him to walk from Sunium to Athens on the 10th December, 1911. By A.D. 1952 it was possible for any politician in Washington, on any day of the year, to present himself, within the day, in person before an audience in any part of the United States; and, though it was not possible for him to be present in the flesh in every city, town, village, and homestead in the country at the self-same moment, it was possible at the self-same moment

¹ See IV. iv. 310-13.

² It was true that Roman citizens organized in local communities with the status of *municipia* had originally been saddled with the duties of Roman citizenship without enjoying the corresponding rights; but Roman citizens organized in local communities with the status of *coloniae Romanae* had always enjoyed these rights, besides being bound by those duties, subject to their being physically able to exercise these rights by making the journey to Rome.

³ See V. vi. 7, n. 4; VI. vii. 156, n. 3; VI. vii. 375; and pp. 553-4, below.

for every inhabitant of all these homesteads, villages, towns, and cities to enjoy the edifying experience of listening to Cleon by radio and viewing him by television.

Thanks to these recent *chefs-d'œuvre* of Western Technology, it was in fact possible for all citizens of the United States at any moment to listen in and look in to the public discussion of political issues; and it was also possible for the spokesmen of any 'lobby' to take a more active part than this in American national politics by flying within the day from Portland, Oregon, or from San Diego, California, to Washington, D.C., and bringing Cleon to bay in his den on Capitol Hill before the demagogue had had time to forestall a Pacific Slope 'pressure group's' offensive by winging his own way to the Pacific Coast and cajoling a Californian or Oregonian audience face to face. It was true that the citizen body could not yet descend on Washington at a day's notice *en masse* pending the requisite multiplication of seats on aeroplanes and rooms in hotels. Yet, if in this respect the United States in A.D. 1952 might be deemed still to be not quite so close-knit, in terms of human intercourse, as Attica had been in 449 B.C., the United States was already closer-knit than Attica had ever been on the new plane of intercourse that the inventions of broadcasting and television had opened up. In Hellenic history there had never been a time when the entire population even of a Lilliputian Belbina, not to speak of a Brobdingnagian Attica, had been able to listen to the voice, and watch the countenance and gestures, of a politician talking to an assembly in the agora at the capital. On this plane the United States in A.D. 1952 was as diminutive in size, expressed in terms of human intercourse, as Abraham Lincoln's Springfield or as Demosthenes' Paeania; and the United States' size today gave the measure of the World's size tomorrow, since, if any one thing could be predicted with assurance in the apprehensive World of this date, it was that a rapidly growing fleet of aeroplanes, flying at a rapidly accelerating speed, would become capable of reaching their destinations in a rapidly diminishing number of minutes, and that a rapidly growing host of radio and television sets would become capable of picking up sights and sounds at a rapidly increasing distance from the points where these importunate instruments were located.

It will be seen that in A.D. 1952 world government was already within Mankind's grasp in so far as Technology could avail to thrust this now urgent political necessity into human hands. As soon, however, as we ascend—or descend—from the plane of Technology to the plane of Human Nature, we find the earthly paradise skilfully assembled by the ingenuity of *Homo Faber* being reduced to a fool's paradise by the perversity of *Homo Politicus*.

In A.D. 1952 a democratic world government that had now become technologically feasible was not within sight of becoming practical politics, because the ripe fruits of Technology could not be harvested without a change of heart of which, so far, there was little sign. In a coalescing and shrinking *Oikoumenê* whose human inhabitants were finding themselves at ever closer quarters with one another, an urgently needed, but not yet inaugurated, world order was still awaiting the

fulfilment of a prophecy made in the Syriac World in the eighth century B.C. by the Judæan seer Isaiah:

'The wolf . . . shall dwell with the lamb and the leopard shall lie down with the kid, and the calf and the young lion and the fatling together; and a little child shall lead them. And the cow and the bear shall feed; their young ones shall lie down together; and the lion shall eat straw like the ox. And the sucking child shall play on the hole of the asp, and the weaned child shall put his hand on the cockatrice' den. They shall not hurt nor destroy in all My holy mountain; for the Earth shall be full of the knowledge of the Lord, as the waters cover the sea.'¹

This Hebrew prophecy had not been left altogether unfulfilled by the Earth's non-human fauna; for it was a scientifically verified fact that the beasts of prey did have a habit of granting a truce to fellow creatures that were normally their quarry when a drought drove them all to the same still welling spring, or a forest fire to the same still unscorched glade, or a flood to the same still unsubmerged holy mountain; and these habitual signs of grace in the dumb animals' response to the challenge of emergencies threatening the lives of all creatures alike were the foil against which a Syriac prophet or a Western naturalist would contemplate the twentieth-century spectacle of human carnivores that still could not or would not bring themselves to enter into a Truce of God, even when they were being forced to rub shoulders with one another by the menacing rise of a tide of atomic science round the coasts of a shrinking *Oikoumenê*.

In A.D. 1952 the nearest approach to political co-operation that a Russian bear and an American eagle found themselves able to make to one another was their common participation in the activities of the United Nations Organization. The inability of the two surviving Great Powers to come closer together than this had been the limiting factor that had prevented the architects of the constitution of the U.N.O. from making of it anything more intimate than a forum for international debate between delegates of the governments of sovereign independent states, of which three, besides the two titans, were armed with a veto on resolutions passed by a majority of their fellow states-members. During the five years of its existence up to date, the U.N.O. had demonstrated its value, notwithstanding the severity of these limitations, by proving to be a decidedly more conductive means of political communication than 'the usual diplomatic channels'. Delegates of the United States Government and the Soviet Government could still continue to talk to one another here when the traditional channels of communication had become choked; and at Lake Success they were parleying in the presence, and with the participation, of delegates of governments of states of lesser calibre which, in this forum, had a constitutional right to make their own voices heard.

These were no mean services to the cause of peace and concord; and an oecumenical institution that provided these services was one with which Mankind could not afford to dispense in their perilous situation at the time. Yet these merits did not make the U.N.O. capable of be-

¹ Isa. xi. 6-9.

coming the embryo of a world government. The realities of the distribution of power in the World that had emerged from the Second World War were not adequately reflected in the clumsiness of a constitution that had embodied the unrealistic principle of 'one state one vote', and that had then found no better means of bringing a fictitious 'equality of states' into line with a harsh reality than the concession to five Powers of a veto that was denied to their nominal peers. The best prospect in sight for the U.N.O. was a possibility that it might evolve from being a forum into becoming a confederacy; but there was a great gulf fixed between any confederacy of sovereign independent parochial governments and any federation of peoples with a central government claiming and receiving the direct personal allegiance of each individual citizen of the union; and it was notorious that the history of political institutions knew of no case in which this gulf had been crossed by any other process than a revolutionary leap.

On this showing, the U.N.O. seemed unlikely to be the institutional nucleus out of which an eventually inevitable world government would develop, though it seemed likely to remain an indispensable instrument for the preservation of peace unless and until a unitary world government had grown out of some other germ. In A.D. 1952 the probability seemed to be that, if and when an effective world government did come into being, it would take shape through a development, not of the U.N.O., but of one or other of two older and tougher political 'going concerns' which, as a result of the outcome of a Second World War, had already partitioned the *Oikoumenê* between them. The world government of the future seemed likely to stem either from the Government of the United States, which in A.D. 1952 was already in effect the government of more than one-half of the *Oikoumenê*, or from the Government of the Soviet Union, which at the same date was already in effect the government of the rest of the Habitable and Traversable World.

If the living generation of Mankind had been free to choose

utrorum ad regna cadendum
omnibus humanis esset terrâque marique,¹

there could be little doubt in a contemporary Western observer's mind that a decisive majority of all living men and women that were competent to make any judgement at all upon this issue, and an overwhelming majority of such people in all Western countries, would have opted for becoming subjects of the United States, and not subjects of the Soviet Union, so long as these two Powers continued to divide between them the dominion over the *Oikoumenê*; and there could be equally little doubt that the same millions would also have prayed for the victory of the United States in the event of a war between the two Powers for the prize of world-wide supremacy that the elimination of one competitor would leave exclusively in the surviving competitor's hands. In Western eyes, at least, it seemed self-evident that, if Mankind were indeed to be confronted with a choice between destroying itself or acquiescing in the enforcement of peace by the fiat of some single Power, and if they were

¹ Lucretius: *De Rerum Naturâ*, Book III, ll. 836-7, quoted on p. 484, above.

then to be confronted with a choice between the United States and the Soviet Union as the only possible two candidates for this necessary yet invidious political mission, the United States would be preferable, out of all comparison, to the Soviet Union as the victor in this fateful competition for being the Power whose fiat the rest of Mankind was henceforth to obey.

The virtues that made the United States incomparably preferable to the Soviet Union as a candidate for this imperial role stood out conspicuously against a Communist Russian foil.

America's cardinal virtue in the sight of her present and prospective subjects was her transparently sincere reluctance to be drawn into playing this role at all. An appreciable portion of the living generation of American citizens, as well as all the ancestors of all American citizens who were not themselves immigrants, had been moved to pluck up their roots in the Old World and to start life again on the farther side of the Atlantic by a yearning, not to meddle in, but to extricate themselves from, the affairs of a Continent whose dust either they or their forebears had once demonstratively shaken from off their feet;¹ and the buoyancy of the hope with which the forebears had made their deliberate withdrawal from the Old World in the seventeenth, eighteenth, and nineteenth centuries was matched by the poignancy of the regret with which the living generation of Americans was making its compulsory twentieth-century return. The compulsion, as we have seen,² was taking the form of an 'annihilation of distance' through the progress of a Western technology; and the Americans themselves had done perhaps more than any other Western people to develop this peculiarly Western art in the direction in which its course was now running directly counter to its American adepts' cherished political aims and ideals. The flaming sword wielded by this inexorable angel of their own creation who was expelling the Americans from their utopian earthly paradise had been flaring in the skies since the invention of the aeroplane at the turn of the nineteenth and twentieth centuries. Yet nothing less cogent than the experience of finding themselves involved willy nilly in two world wars in one lifetime could have moved the American people between A.D. 1941 and A.D. 1947—as the Japanese people had been moved between A.D. 1853 and A.D. 1868 by the logic of comparably portentous events—to recognize that they could no longer safeguard their interests, independence, or even existence unless they broke with a traditional policy of isolation which still retained a hold on their hearts even when it was ceasing to convince their intellects. Shrinking, as they did, from involvement in international politics, the Americans shrank still more vehemently from being cast, as they were being cast by their inescapable preponderance in power, for the role of serving as their neighbours' leaders and masters; and their manifestly genuine regrets for a lost idyllic seclusion were their best credentials for commending them to foreign peoples over whom the force of circumstances was constraining them to assume authority.

'The truth is, and must be, that social life is happiest and most har-

¹ Matt. x. 14; Mark vi. 11; Luke ix. 5 and x. 11; Acts xiii. 51 and xviii. 6.

² On pp. 479-86, above.

monious where those who have to rule are the last people who would choose to be rulers, and is least happy and least harmonious where the rulers are of the opposite disposition.¹

On the morrow of the Second World War, Plato's dictum was as exculpatory for the Americans as it was damning for the Russians.²

The Americans' second outstanding virtue was their generosity. It has been noticed in a previous chapter,³ as one of the auspicious features in the situation after the Second World War, that the Soviet Union, as well as the United States, was a 'sated' Power; but the economic and social situations of the two countries were identical only in the general sense that Russia, like America, was a country commanding vast still undeveloped human and non-human resources. In contrast to America, Russia had hardly yet begun to exploit her potentialities, and the developments that she had carried out at such cost in human effort and suffering during the twelve years immediately preceding the German assault upon her in A.D. 1941 had been largely sabotaged by her abominable Western invaders. Thereafter, the Russians had taken an unjust advantage of finding themselves on the winning side by recouping themselves for the Germans' destruction of Russian industrial plant by seizing and removing plant, not only from a guilty Germany, but from East and Central European countries that the Russians professed to be liberating from the Nazis, and from Chinese provinces in Manchuria that they professed to be liberating from the Japanese. This was a contrast indeed to the United States' post-war reconstruction policy of first making, on a vote passed in the House of Representatives at Washington on the 25th January, 1944, a major contribution to the resources placed at the disposal of the United Nations Relief and Rehabilitation Administration, and then following up this short-term emergency measure for the relief of the war-stricken peoples of the World by launching, on the 5th June, 1947, a long-term plan for reconstruction in Europe that was to be payable entirely out of the American tax-payer's pocket.

The Marshall Plan was perhaps not quite unprecedented. There was a classical precedent in a post-Alexandrine chapter of Hellenic history that had seen the states of the Hellenic World of the day vie with one another in the generosity of their gifts to the city-state of Rhodes after Rhodes had been smitten by an earthquake in 227 B.C.⁴ This, however, had been a case of many countries contributing towards the relief of one country, whereas the Marshall Plan was a case of one country offering help to all the rest, and making this offer at a time when the donor was

¹ Plato: *Respublica*, 520 D, quoted in III. iii. 252.

² Damning, that is to say, for the Russians in the role of rulers, in which the Russians had always been at their worst. There had, however, been another role in which the Russians had always been at their best since the days of Boris and Gleb (*passorum* A.D. 1015), and that was the role of martyrs. The noble army of Russian martyrs, whose ranks had been perpetually recruited by one generation after another of intrepid volunteers from the eleventh century to the twentieth, bore witness to the historical fact that the tyrannical vein in the Russian *êthos* had always been under challenge from an anti-theological Russian spirit of self-sacrificing love that had known no fear of 'them which kill the Body but are not able to kill the Soul' (Matt. x. 28; cp. Luke xii. 4-5). A student of Russian history, looking forward in A.D. 1952, would be slow to believe that this other vein in the Russian *êthos* had run dry.

³ On p. 478, above.

⁴ See Polybius: *Oecumenical History*, Book V, chaps. 88-90, cited on p. 271, above.

already the strongest single Power in the World of the day. In the past it had been customary for dominant Powers, not to give, but to take,¹ and there had been no departure from this evil custom in the policy that the Soviet Union had been following. In setting a new moral standard for 'power politics' by launching the Marshall Plan, American statesmanship was putting Russian post-war actions to shame and Russian post-war intentions to an 'acid test',² and on both these counts Russian statesmanship made a poor showing in its response to this searching American challenge. In declining Marshall Aid for the peoples of the Soviet Union, the Soviet Government might be held to be acting within its rights, and foreign critics, at any rate, had no *locus standi* for objecting to a decision against which no effective protest had been made by the *misera plebs Sovietica* at whose expense their government's decision had been taken; but, in using her hold over her satellites in order to compel them too to reject the American offer, the Soviet Union was guilty of an abuse of power that was particularly flagrant in cases in which countries at her mercy whom she was forbidding to accept American assistance happened to be countries that were doubly in need of it because they had been stripped by the Soviet Government, since the end of the Second World War, of industrial plant which the war itself had spared.

It will be seen that Russia's behaviour would have made a present to America of the beau rôle even if America's behaviour had not been as handsome as in fact it was; and this contrast between the post-war records of the two surviving Great Powers comes out even more sharply when we pass from the economic plane to the political and the military. A post-war world that was craving for freedom from want had a still greater yearning for freedom from fear; and, while the fear inspired by the Soviet Union was as intense as it was ubiquitous, fathers of families in countries under the hegemony of the United States were not being kept awake at night by any fear that a United States Government that had them in its power might abuse this power by coercing them with the threat of taking their children's lives with atomic weapons which, in 'the Free World', were an American monopoly.

Citizens of West European countries were, however, now haunted by fears that some American decision, in which the West European peoples

¹ Imperial Powers which, like the Roman Empire in the Hellenic World and the British Rāj in India, had plumed themselves on their disinterestedness, had been apt to claim credit, not for having subsidized their subjects out of their own pockets, but for having (as Clive saw it) shown an astonishing moderation in leaving even a shred of wool on the backs of defenceless sheep whom the imperialists had been at liberty to shear. It was true that, in the British dominions in India, Lord Cornwallis had restrained a British rapacity, and stamped out a British corruption, that had been running riot for a generation, and that in the Roman Empire Caesar and Augustus had put an end to the still more disgraceful orgies of Roman business men after these had run riot for longer than a century and a half; but such testimonials are not easy to distinguish from indictments. 'What shall we say then? Shall we continue in sin, that grace may abound? God forbid' (Rom. vi. 1-2).

² In A.D. 1947 the reigning government in Russia was a fair target for a telling phrase which in A.D. 1918 had been levelled primarily at the government then reigning in Germany by a President of the United States speaking on Russia's behalf. 'The treatment accorded to Russia by her sister nations in the months to come will be the acid test of their good will' (Point VI of President Wilson's Fourteen Points announced in his address at a joint session of the two houses of the Congress at Washington on the 8th January, 1918).

might have had no say, might inadvertently bring Russian atomic missiles hurtling down on Dutch, Danish, French, and British heads. Such West European fears of dire consequences descending upon Western Europe as unintended by-products of some impulsive American retort to some provocative Russian act of aggression were anxieties that might or might not be well founded, but their currency in Western Europe was a fact, and this psychological fact exposed a constitutional flaw in the structure of a commonwealth of Western nations in which all the partners, with the crucial exception of one partner whose 'fiat' was 'law', were exposed to the risk of being involved in a perhaps irretrievable catastrophe as a consequence of decisions in which they might have had no voice, on issues in which, for them, the stakes were life and death. It was proverbial that in a society articulated into a number of sovereign independent parochial states every people was apt to get the government that it deserved;¹ and even this political nemesis was not easy for human souls to bear, notwithstanding the undeniable justice of it. In a commonwealth of nations indissolubly associated under the hegemony of a paramount Power, the lot of all the subordinate participants was the intolerable injustice of getting a government that had been deserved, not by them, but by their predominant partner; and this was the plight of America's, as well as Russia's, satellites in A.D. 1952.

It was, moreover, a plight that could not be mitigated appreciably by resorting either to 'the usual diplomatic channels' or to the new forum provided by the United Nations Organization. Under the current unwritten constitution of a nascent Western Community, issues of vital or lethal moment to its West European, Canadian, and Australian citizens were being decided by the play of party politics in the domestic political arena of the United States. The non-American citizens of the Western Community had no institutional means of taking part in the working out of Western policy at this domestic American formative stage; and the most that their municipal governments could do on their behalf was to make the ineffective gesture of tabling motions pleading that a stable door should be locked after an apocalyptic steed had flown.²

By A.D. 1952 a celebrated American definition, dating from A.D. 1895, of the standing of the United States in the Western Hemisphere had come to be no less true of her standing in a world-wide *Oikoumenê* in which all countries were under the United States' hegemony save those that were under the Soviet Union's domination.

'To-day the United States is practically sovereign' ['in the United States' portion of a partitioned world', as an observer, quoting Olney's despatch in

¹ 'Toute nation a le gouvernement qu'elle mérite' (de Maistre, J.: *Lettres et Opuscules Inédits* (Paris 1851, Vaton), vol. i, p. 215, 15th August, 1811).

² By the end of the year A.D. 1950 these painful truths had been borne in upon the minds of the West European citizens of the Western Community by their experience of an international crisis over a local war in Korea that had been threatening to rankle into a war of world-wide dimensions. The contemporary reaction of a West European nationalist was expressed in caricature in the aphorism 'America was thus clearly top nation, and History came to a.' (Sellar, W. C., and Yeatman, R. J.: *1066 and All That* (London 1930, Methuen), p. 115). The reaction of a West European federalist, addressing himself to an American public, might be expressed in the slogan: 'No annihilation without representation.'

A.D. 1952, would be inclined to amend the text in substitution for the original words 'on this continent'], 'and its fiat is law upon the subjects to which it confines its interposition. Why? It is not because of the pure friendship or good will felt for it. It is not simply by reason of its high character as a civilised state, nor because wisdom and justice and equity are the invariable characteristics of the dealings of the United States. It is because, in addition to all other grounds, its infinite resources, combined with its isolated position, render it master of the situation and practically invulnerable as against any or all other Powers.'

This dictum on the standing of the United States had not lost any of its cogency in coming to be applicable to a far wider sphere of hegemony than had been in the mind of the Secretary of State at Washington who had written those sentences in A.D. 1895; and, though a patriotic non-American citizen of a twentieth-century Western commonwealth of nations might be content to make the pertinent comment that the most lacerating American whips were, at any rate, less grievous instruments of political chastisement than even the least venomous Russian scorpions, 'a philosopher' might 'be permitted to enlarge his views'² by taking some meteorological observations. In the first place he would observe that the virtual monopoly, by a paramount Power, of the determination and execution of policies in which the lives and fortunes of satellite peoples were at stake was pregnant with a constitutional problem that could not be evaded; second, that, in the partitioned *Oikoumenê* of A.D. 1952, this problem was a live one both in the American and in the Russian sphere of hegemony or domination; third, that the problem would still present itself, and still demand a solution, if the two spheres were eventually to be amalgamated; and, fourth, that this problem could not be solved without recourse to some form of federal union.

The mere recital of these observations made it clear that the constitutional issues raised by the advent of a supra-national order on the political plane were unlikely to be settled easily or rapidly. One promising feature in the situation was that the United States and the Soviet Union—one or both of whom would have a decisive say in the constitutional development of a commonwealth of nations under its hegemony—were, as it happened, both of them morally committed to an approval of federalism in principle in virtue of having written it into their own constitutions.

The Constitution of the United States was the product of a deliberate choice of full federal union in preference to a looser form of political association—between states only, and not also between human beings—that had quickly been proved inadequate by painful experience; and the people of the thirteen original states—members of the Union had federated with one another on terms that had left a door open for the admission of new-comers. In the minds of latter-day citizens of a United States that had increased its membership from the original figure of thirteen states to an eventual figure of forty-eight between A.D. 1792 and A.D. 1912, a

¹ Secretary of State Richard Olney, in a dispatch of the 20th July, 1895, to the United States Ambassador to the Court of St. James's.

² Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, 'General Observations on the Fall of the Roman Empire in the West', at the end of chap. xxxviii.

familiarity with the history of their country during those 120 years had associated the idea of federalism with the idea of progressively incorporating additional constituents; and against the historical background of this domestic American precedent a suggestion that the American people themselves might one day enter into a federation with other peoples would not be startling even to Americans who found it unpalatable. A federation between the peoples of the United States and other English-speaking countries would, indeed, be very closely in line with domestic American constitutional tradition. A proposal to extend a federation of English-speaking Western peoples to Continental West European peoples that were akin to the English-speaking peoples in their way of life without being linked with them by a community of language might, on the other hand, look, in American eyes, like a hitherto untried venture for which no adequate precedent was to be found in the domestic American experience of incorporating into the citizen body of the United States a small French-speaking population in Louisiana in A.D. 1803 and small Spanish-speaking populations in California and New Mexico in A.D. 1848. Yet the United States' next-door neighbour Canada was a successfully working model of a federation between two peoples, speaking different languages and professing different religions, who were approximately equal to one another in numbers; and another cue was offered by the letter of the law officially in force in the Soviet Union.

In Western eyes the federal constitution with which the Soviet Union had equipped itself might look suspiciously like a façade put up to mask the retention or re-establishment of a centralized despotism that had the momentum of six hundred years of Russian history behind it. The Petrine Russian Empire from which the Soviet Union had inherited its immense patrimony had been the heir of a Muscovite principality that, from the fourteenth century of the Christian Era onwards, had added field to field by extinguishing the independence of one after another of its neighbours. Was not the Union of Soviet Socialist Republics merely a disingenuous new title for a unitary autocracy of which no concealment had been made by Stalin's franker predecessors Peter the Great and Ivan the Terrible? As far as any Western observer could judge, this current Western critique of the constitution of the Soviet Union was fair comment on the whole. Yet there was one point in which the Bolsheviks' professed constitutional new departure appeared to have some substance, and this was a point in which Stalin's hand was credibly reported to have been at work. Thanks to his own Georgian origin, Stalin seems to have appreciated the strength of the nationalist opposition aroused among the non-Russian subjects of the former Russian Empire by a policy of Russification; and he seems to have drawn the conclusion that, if this policy were not repudiated and reversed by the Tsardom's Communist successors, the effect would be to alienate the non-Great-Russian citizens of the Soviet Union from a Communism which they would then write off as a new disguise for a familiar Russian imperialism.

Accordingly, when the constitution of the Soviet Union was being worked out during the years A.D. 1918-24,¹ the internal administrative

¹ The constitution in force in A.D. 1952 was that of the 6th December, 1936.

map of the former Russian Empire was entirely recast—and this apparently on Stalin's initiative—on lines that brought it into correspondence with the linguistic map; and the non-Great-Russian nationalities of the Union—including even the smallest and the most backward peoples in the Caucasus, the Urals, and Central Asia—were thus granted at least the boon of having their local administration and education conducted in their own mother tongues, however illusory their official autonomy might be in other respects. This Stalinian administrative map of the Soviet Union, drawn on a linguistic basis, was no *Magna Carta*. For example, the erection of an Autonomous Republic of Bashkiristan within the framework of a Russian Socialist Federative Soviet Republic in A.D. 1920 did nothing to abate the centralization at Moscow of the control of police, communications, economic affairs, and, indeed, all the effective levers of power; and, more than that, it did nothing in this case—under a local government on which the Bashkirs themselves were not represented—to check the continuation under the Soviet régime of the unedifying process of chicanery, expedited by brute force, through which, under the Tsardom, the Bashkirs' lands had been passing into Great Russian hands.¹ No doubt the Bashkirs, like the Five Civilized Indian Nations in the South-Eastern United States, were marked out for being made the victims of spoliation by the fact of their happening to lie in the fairway of a mighty tide of aggressive colonization; but the Bashkirs were not the only non-Russian people to suffer adversity under the Soviet régime. Thereafter, in the Great Purge of A.D. 1936, the non-Great-Russian personnel in the governments of some of the non-Great-Russian units on Stalin's administrative map was reported to have been liquidated,² and in the Russo-German War of A.D. 1941–5 both the Crimean Tatar Republic and the Kalmuck Republic on the Steppe between the Lower Don and the Lower Volga seem to have foundered on the charge that their peoples had been guilty of disloyalty to the Soviet cause.

It will be seen that Stalin's administrative map of the Soviet Union was not to be taken at its face value; but a moral commitment cannot be wiped out through being dishonoured by its makers; and, in the world that had emerged from the Second World War, Stalin's map might live to be translated, after all, from the limbo of camouflage into the realm of reality if, on either side of the dividing line between a Russian and an American demi-monde, the letter of the Soviet Union's federal constitution were one day to be applied in the spirit of the Pan American Union of Republics and the British Commonwealth of Nations.

On the constitutional plane neither of these two political associations between a number of fully self-governing parochial states was a stage on any road leading towards world government, since the basis of both associations was the scrupulousness of the associated states' reciprocal respect for one another's independence. The members of the Pan American Union were not moving towards a federation between these

¹ See Pipes, R. E.: 'The First Experiment in Soviet National Policy: The Bashkir Republic, 1917–1920', in *The Russian Review*, October 1950 (New York), pp. 303–19.

² See Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs, 1937*, vol. i (London 1938, Milford), pp. 13–20.

successor-states of four different West European Powers' colonial empires,¹ and the members of the British Commonwealth had been positively moving away from the former political unity of an old-fashioned British Empire governed from Westminster. The British Commonwealth was, in fact, an *entente* between mutually independent states that had disengaged themselves from a unitary empire, while the Pan American Union was an *entente* between mutually independent states that had never been united politically in the past and were not moving towards unity now. Yet, just because the weaker parties to the association were aware—as they were in either case—that the strongest member of the partnership had no intention of misusing his superior strength in order to impose his will upon the rest, both the Pan American Union and the British Commonwealth had achieved a felicitous relation of psychological parity between states of widely different calibre whose peoples not only spoke different languages but were also divided from one another by the more formidable barrier of a diversity in their ways of life. In this favourable psychological climate it had proved possible for Great Britain and Ceylon, the Indian Union and New Zealand, the United States and Guatemala, Brazil and Hayti, freely to co-operate with one another as moral equals; and the spirit animating these *ententes* might be enlisted in the cause of federation.

Though the practical possibility of federation, either with the United States or with the Soviet Union, was limited by the notorious fact that, hitherto, so intimate a form of political association had proved practicable only between communities closely akin to one another in their ways of life, the cultural and social circumstances of the time gave scope, within these limits, for federal union on a considerable scale. Federation with the Soviet Union did not, it is true, seem likely, in the dubious judgement of a Western observer, to prove an attractive proposition either to the Soviet Union's Orthodox Christian satellites to the south of her or to her Western Christian satellites to the west of her; but a federal union between the United States, the other English-speaking peoples, and the Continental West European peoples would already have been within sight above the horizon of practical politics if an affinity in culture and a community of interests had been the sole, or even the decisive, considerations. The obstacle—and it was a formidable one—was a human political animal's proneness to give prejudice the precedence over common sense and to allow itself to be swayed by feelings instead of taking rational decisions on the merits of a constitutional case. An American people which had once had to fight in order to win its independence would be reluctant to pool its sovereignty in a federal partnership with other peoples, even if the candidates for partnership were peoples of like passions with itself² and also even if the principal partner were assured that her own representation in the prospective federal government would be proportionate, not merely to the relative numerical strength of her population, but to an index figure registering

¹ The United States was a successor-state of the British Empire, Brazil of the Portuguese, and Hayti of the French. All the other seventeen members of the Pan American Union were successor-states of the Spanish Empire.

² Acts xiv. 15.

the United States' overwhelming preponderance over the rest of the Western World in economic productivity. On the other side, West European satellites of the United States might be reluctant, for their part, to sacrifice a shadow of sovereignty that they still retained in a dependent relation which actually left them at the United States' mercy; and, for the sake of clinging to this shadow, they might refrain from making any attempt to win the substance of an equitable share in the joint conduct of common affairs which could be obtained only at the price of pooling, in a federal union with the United States, a sovereignty which, in this form, could be revalidated within limits corresponding to current political and economic realities.

The mulish perversity of Human Nature that thus threatened to assert itself on both sides, if and when a proposal for federation was brought forward, was an obstacle that could not be expected to yield easily or quickly to common sense and goodwill; yet there were historical precedents which indicated that, in any commonwealth of nations that had originated in the establishment of one dominant Power's paramountcy over a cluster of satellites, the passage of time would be likely to bring with it a gradual approach towards political equality through the progressive enfranchisement of the imperial people's former subjects or subordinates.¹

In the history of a Roman Commonwealth whose *arcanum imperii* had been its liberality in conferring the Roman citizenship upon aliens who had fallen under Rome's rule or hegemony, successive narrow-hearted reactions against this characteristic manifestation of a Roman political genius had all, in turn, been successively transcended sooner or later. Between 338 B.C. and 241 B.C. the inhabitants of about one quarter of Cisappennine Italy, extending along the south-west coast as far down as Cumae, and along the north-east coast as far up as Pesaro, had been progressively incorporated into the Roman citizen body, and this politic generosity had enabled Rome to establish her dominion over the whole peninsula. The door that had thus been held open for a century had then been closed and had been kept bolted and barred thereafter for the next 150 years; but in 90-89 B.C. the rest of Rome's Italian satellites had extorted the Roman franchise from the paramount Power by force of arms; and, when, after this tardy further step forward, the reactionaries had brought the process of enfranchisement to a halt again, this time along the line of the River Po, the door had been broken open by Caesar and had never been closed again. Caesar's enfranchisement of Rome's Transpadane satellites in 49 B.C. restarted a process which this time never came completely to a halt till in A.D. 212 it reached its term in Caracalla's enfranchisement of virtually all the residue of Rome's then still unenfranchised subjects throughout an empire that embraced all but a fragment of the Hellenic World; and the readiness of the Roman citizen body at this stage to share its political privileges with the rest of the inhabitants of an Hellenic *Oikoumenê* that had been united politically under Rome's aegis seems to have been matched by a readiness on the part even of ancient and famous non-Roman Hellenic communities now

¹ See, for example, VI. vii. 146-58.

to accept Roman citizenship at the cost of, at long last, merging in an oecumenical body politic a parochial identity which they had been jealously preserving through the ages. In earlier chapters of Hellenic history there had been at least two critical occasions—the first in 431 B.C. and the second in 228 B.C.¹—on which Athens and Sparta had remorselessly sacrificed the Hellenic Society's prospects of attaining an urgently needed political unity to their own parochial corporate egotism. There is no record of the re-emergence of this spirit in either Spartan or Athenian hearts on the historic occasion at the turn of the second and third centuries of the Christian Era.²

In the history of the Caliphate a corresponding evolution was accomplished more swiftly. Little more than a hundred years elapsed between the political reunification of the Syriac World by the arms of Primitive Muslim Arab *conquistadores* in the fourth and fifth decades of the seventh century of the Christian Era and the *Gleichschaltung* of the Arab Muslim 'ascendancy' with their non-Arab ex-Christian and ex-Zoroastrian converts and clients as a result of the Khurāsānī Iranian Muslim marchmen's victorious insurrection against the Umayyad régime in A.D. 750.³

These precedents from Syriac and Hellenic history were good auguries for the prospect that, in a post-Modern chapter of Western history, a supra-national commonwealth originally based on the hegemony of a paramount Power over its satellites might eventually be put on the sounder basis of a constitutional partnership in which all the people of all the partner states would have their fair share in the conduct of common affairs. A constitutional development on these lines seemed as probable in the long run as it was desirable, but in A.D. 1952 this was not the first business on Mankind's political agenda. The rock immediately ahead was a sooner or later inevitable transition from a present political partition of the *Oikoumenê* between two rival Powers to a

¹ See III. iii. 340-1 and IV. iv. 265.

² Professor William McNeill comments: 'Was Roman citizenship still a privilege by the time of Caracalla? Or was it a burden? Some historians think that the franchise was extended to all free men for the purpose of making them liable to the citizens' taxes on inheritances, etc., [in addition to the subjects' taxes, to which they were liable already]. In any case the willingness of the existing citizen body to see new-comers allotted to its ranks will hardly have counted. The act of enfranchisement was surely an administrative act of a bureaucracy which was by then more or less immune from public opinion—at least in most matters.'

The present writer's reply would be, in general, that bureaucratic or autocratic governments, as well as elected representative governments, are amenable to public feeling and opinion—though their reaction to it may sometimes be slower, and though they may perhaps be able to go rather farther in the dangerous game of flouting it without being called to order. In regard to the case in question, his reply, in particular, would be that this enfranchisement of virtually the whole of the still remaining non-citizen element in the population of the Roman Empire was followed by the growth of a corporate sense of imperial patriotism which eventually expressed itself in the coining of the new word 'Romania' to denote a now undivided and homogeneous Roman imperial people's oecumenical fatherland. This sequel to the Act of A.D. 212 suggests that this Act was well timed in the sense of having been enacted at a date at which the public feeling of the divers elements in the population of the Empire was ripe for it; and if it had not been 'practical politics' in this sense in A.D. 212 it would not, so the writer would guess, have been possible to enact it in that year merely because of its fiscal attractiveness in the professional eyes of an imperial bureaucracy. The writer would also guess that even as recently as the reign of Hadrian (*imperabat* A.D. 117-38) it would not yet have been 'practical politics' to enact the provisions of the *Constitutio Antoniniana* of A.D. 212, however attractive the measure might have been to the bureaucracy already at this earlier date.

³ See II. ii. 141 and VI. vii. 147-52.

future political unification of the *Oikoumenê* under the control of some unitary political authority; and the first concern of the living generation of Mankind was that this perilous transit should be accomplished without a third world war.

In an age of atomic warfare there were no peoples for whom this was not a matter of life and death in a world whose unification was already an accomplished fact on the military plane, but there were three peoples that had also incurred a special measure of moral responsibility for seeing to it that an urgently needed world order should be established without another catastrophe. In bringing about, between them, the defeat of Germany in the World War of A.D. 1939-45, the peoples of Great Britain, the Soviet Union, and the United States had taken it upon themselves on behalf of Mankind to reject Hitler's offer of a lasting peace at Hitler's price. If in A.D. 1940-1 Hitler had been allowed by these three Powers to have his way, peace would have been imposed on the World by the establishment of a *Pax Germanica* that would have relieved Mankind from the fear of another world war for as far ahead into the future as any human eye could see. Hitler's price for this boon had been so exorbitant that the three victor Powers' decision to reject his offer was likely to win for them the blessings of Posterity supposing that they were now to succeed, between them, in bestowing the same boon on Mankind at an appreciably lower cost in the coin of standardization, regimentation, injustice, and tyranny. On the other hand, these same victors over Hitler would bring down upon their own heads Posterity's curses if they were to allow a third world war to rankle out of their victory. In denying to Mankind the opportunity of enjoying the substantial benefits of an odious *Pax Germanica*, the peoples of the United States, the Soviet Union, and Great Britain had taken upon themselves a binding moral obligation to provide Mankind with a better world order than Hitler's without inflicting on Mankind the third world war that a German victory would have spared them.

Should the ex-victors now fail to accomplish this self-imposed task, they must expect to share with the Germans the execrations of an intolerably tormented Mankind so long as any memory survived of Mankind's history in the twentieth century of the Christian Era. On the other hand, if, between them, they were to succeed in piloting Noah's Ark intact into the still waters of the lagoon beyond the perilous reef, they could look forward to being remembered throughout the rest of the Human Race's term of life on Earth as the heroes who, by an unprecedented moral triumph over the perversity of their own human nature, had closed a chapter of human history branded with the ghastly mark of Cain¹ as the abominable Age of Civilization, Human Sacrifice, Slavery, and War, and had opened the way for Mankind to acquit itself better than before in its perennial struggle with an innate Original Sin. A generation which, in A.D. 1952, was thus bound over to render a strict account of a morally onerous stewardship might take heart from the words of an Athenian philosopher who had witnessed the breakdown of the Hellenic Civilization.

¹ Gen. iv. 15, 17, and 22.

'In the struggle that will decide whether good or evil is to prevail in us, the issue is immeasurably greater than at first sight it might seem to be. . . . We must do everything that lies in our power to attain to Virtue and Wisdom in This Life. The prize is so splendid and the hope is so great.'¹

(V) PROBABLE FUNCTIONS OF A FUTURE WORLD ORDER

Supposing that a world government were to be established, what would its functions be? Presumably these functions would be much the same whether the establishment of this prospective world government were to be achieved pacifically or at the cost of a third world war, and whether it were to remain fixed in its initial form of a domination or hegemony exercised by a paramount Power or were eventually to acquire a federal constitution in which all the people in a supra-national commonwealth might hope to receive something like their fair share in the conduct of common affairs. Evidently the choice between these divers alternative roads might make a world of difference to the possibility of a world government's being able to perform its functions satisfactorily, whatever these functions might be; but the functions themselves would presumably have been determined in advance by the play of those historical forces that, in A.D. 1952, seemed to be making the establishment of some kind of world government, at some price, inevitable. Was the nature of these future functions then perhaps already discernible?

A world government would be the government of a universal state; and the specific characteristics of universal states, as well as the generic characteristics of states of all the divers historic species, were revealed in the history of Man in Process of Civilization within the last five or six thousand years.

A state was an institution in which part of the psychic power-charge of an individual human being was impounded and combined with parts of the power-charges of other men and women to constitute a pool of power at the disposal of persons controlling and operating a government. A state might be defined as a piece of social mechanism designed for the twin purposes of accumulating power and of applying it; and the preservation of the power of a state was consequently bound to be the first concern of the persons, whoever these might be, who had one of these political pools of power at their command. The most dangerous threat to the survival of any parochial state had always been the existence of other parochial states within striking distance of it, and therefore the most urgent business of any parochial sovereign government had been to maintain its own power against encroachments on the part of other parochial governments in the same politico-military arena and, if possible, also to increase its own power at the expense of each and all of its neighbours. At the same time, every parochial government had always had to fight for the preservation of its power on a domestic front as well as on a foreign front, since, even when it was not being threatened by

¹ Plato: *Respublica*, 608 B, and *Phaedo*, 114 C, quoted in V. vi. 168.

the aggressiveness of some foreign Power, a government would still have to reckon with the perennial recalcitrance of its own subjects; and, while it might be true that even in the smallest and weakest state the most powerful private individual would be impotent to resist the government's will so long as he was trying to resist it in isolation from his fellows, it was an obvious move for a number of individuals to take a leaf out of the state's own book by making common cause among themselves in order to pit against the pooled power of the state the pooled power of a family, clan, fief, faction, class, or interest.

In view of this possibility of a concerted private challenge to a state's corporate power, the concern felt by every government for the preservation of its power would force any government to set limits to its subjects' freedom of private enterprise. A government could not afford to allow any individual subject, and *a fortiori* not any organized group of subjects, to enjoy an unregulated licence to accumulate and apply power on their own private account, even in private relations with one another in which the state's interests were not involved directly and were perhaps not involved ostensibly at all. In order to safeguard its authority against threats to it on the domestic front, every government found it necessary to impose laws on its subjects and to see to it that these laws were effectively enforced. States had learnt, for example, that they could not afford to let their subjects take the law into their own hands, or even to let them keep it in their own hands in spheres in which the application and execution of the law had traditionally been, not a public, but a private, affair regulated by non-state institutions like the Blood Feud and the Wergeld. Equity demanded, of course, that a law drafted, promulgated, and enforced in the name of a state by the persons controlling and operating that state's government should not discriminate either to the advantage or to the detriment of any particular member or group of members of the political community, and should not be devised to serve the selfish interests of the ruling group of members constituting the government. In practice, even those states that had achieved the highest standards of justice so far known in the history of Civilization had never been able to preserve their legislation from being affected to some extent by the current domestic balance of power. It would, indeed, probably have been possible for a competent student of human affairs, possessed of full information about the content and application of the laws of any state at any date, to reconstruct, by inference, the domestic balance of power prevailing in that state at that time.

Thus, during the first five or six thousand years of the currency of this institution, a struggle—in which the government of every state that had ever existed had been constantly engaged—for the preservation and increase of a state's power had led, in the lives of parochial states, to a concentration of governmental activity on two functions: the function of competing with foreign Powers by waging war with them for objects unattainable by diplomacy and the function of regulating the private relations between the state's own subjects by legislation in which the current domestic balance of power was invariably reflected to some extent. The existence of states had thus been bound up with the

of the future as being patently *peritura regna*, this struggle within their bosoms between two competing and ultimately incompatible ideals was a new event of abiding interest because the struggle would be bequeathed by them to the world government, whatever this might be, that was to become the doomed parochial states' residuary legatee.

In the obscurity that at this time still veiled Mankind's political future, it could at any rate be foreseen that, if and when something in the nature of a world government did take shape, the task of maintaining its own power would cost it less effort and less anxiety than this had cost any universal state known to History. A single authority holding a world-wide monopoly of the control of atomic energy employable for military purposes would not be confronted by any rival of its own calibre, and it would also not have anything to fear from any residual pockets of recalcitrant barbarians in fastnesses encircled by a global polity that would already have embraced the rest of Mankind. A world government of the future would therefore be free to concentrate its efforts on the promotion of human welfare with a singleness of purpose that had not been feasible for any universal state in the history of any other society.

When a future world government eventually went into action in pursuit of this objective, what would be likely to be its first move? The pursuit of human welfare by political means would raise, as we shall see, for any political authority embarking on it the problem of striking a balance between the competing claims of individual freedom and social justice; but it might be prophesied that this would not be the first concern of a world government in the initial stage of its political operations. The best-intentioned world government would not have its hands free to work either for Justice or for Liberty or for a practical compromise between these two goals of human endeavour unless and until it had succeeded in making adequate provision for Police, in the broadest construction of the term, in a world in which all tools had now become edged tools and in which every act—deliberate or impulsive, wise or foolish—was now charged, no longer just with the innocuously feeble force of human muscles, but with the titanically high-powered 'drive' of machinery 'possessed' by atomic energy.

E. TECHNOLOGY, CLASS-CONFLICT, AND EMPLOYMENT

(I) THE ORIGIN AND NATURE OF THE PROBLEM

IF the meaning of the word 'employment' may be stretched to cover not only the amount and the distribution of work and leisure but also the spirit in which the work is done and the use to which the leisure is put, it would be true to say that the impact of an unprecedentedly potent latter-day Western technique on a literally world-wide Westernizing Society that was still articulated into a number of separate classes with widely different standards of living had confronted the heirs of the Western Civilization with a problem of employment comparable to the problem of government that has been discussed in the preceding chapter.

Like the problem of government, the problem of employment was nothing new in itself; for, if the primary cause of the breakdowns and disintegrations of other civilizations in the past had been a failure to get rid of war by a voluntary and timely expansion of the scope of government from a parochial to an oecumenical range, a secondary cause had been a failure to get rid of class-conflict by voluntary and timely changes in the distribution of the pressure and product of work and the enjoyment and use of leisure. In this field, however, as in that, the extreme difference in degree between a latter-day Western and a previous human mastery over Non-Human Nature was tantamount to a difference in kind. By putting an unprecedentedly powerful new 'drive' into economic production, a Modern Western technology had made a customary social injustice seem remediable and therefore feel intolerable. When the new-fangled cornucopia of a mechanized industry had churned out fabulous wealth—beyond the dreams of any class in any previous generation of this or any other society—for those Western *entrepreneurs* who had sown the seed and reaped the harvest of the Industrial Revolution, why should wealth and leisure still be monopolized by a privileged minority just as they had been before this Modern Western cornucopia had been invented?¹ Why should not this new-found abundance be shared with the Western capitalists by the Western industrial workers, and with the Western industrial workers by an Asian, African, and Indian-American peasantry that had been herded *en masse* into a world-embracing Western Society's internal proletariat?

This new dream of the possibility of abundance for all Mankind had generated unprecedentedly insistent and impatient demands for 'freedom from want'; the vehemence and ubiquity of these demands raised the

¹ This odious reign of arbitrary privilege had been accepted tranquilly, as part of an evidently unalterable order of Nature, by a Late Modern Western historian who had lived to see the beginning of the Industrial Revolution in his own country without having perceived its social implications.

'Such is the constitution of Civil Society that, whilst a few persons are distinguished by riches, by honours, and by knowledge, the body of the people is condemned to obscurity, ignorance, and poverty' (Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, chap. ii).

question whether the productivity of the cornucopia was really inexhaustible, as the importunity of the claims upon it assumed it to be; and this question could be answered only by solving an equation in which there were at least three unknown quantities.

The first of these unknown quantities was the extent of a latter-day Western technology's potential capacity to satisfy the rising demands of a Human Race which was continuing to multiply and was beginning to ask for leisure. What were the planet's reserves of irreplaceable material resources in the shape of minerals, and of replaceable material resources in the shape of water-power and crops and livestock and man-power and human skill? How far could the resources so far tapped be made to increase their yield by the application of more efficient methods of extraction and processing and utilization? And how far could Mankind's wasting assets in the shape of irreplaceable resources be set off by the tapping of alternative resources hitherto unexplored or at any rate unexploited?

At the opening of the second half of the twentieth century of the Christian Era the current findings of Western Science suggested to a layman's mind that the Western technology's capacity was enormous; but at the same time the contemporary reactions of Human Nature to the impact of the Western technological revolution made it evident that there might prove to be practical limitations on this human plane to a productivity that might be virtually infinite in abstract terms of technological potentiality. The production that had been rendered technically possible by a continuing and accelerating Industrial Revolution was a potentiality that could not be translated into a reality unless and until human hands could be found to hew the coal and stoke the fires and pull the levers with a will; but the price of the immensely enhanced power over Non-Human Nature that Western Man's mechanical prowess had now brought within Mankind's grasp was a proportionate increase in the regimentation of the workers and in the pressure of their work upon their life; and their inevitable resistance to these assaults on their personal freedom was bound to militate against the realization of those technological potentialities that had evoked the current demands for freedom from want.

What was the extent of the sacrifices of personal freedom that the workers would be prepared to make for the sake of increasing the size of the cake of which they were each now demanding a larger slice? How far would the urban industrial workers go in submitting to 'scientific management'? And how far would the primitive peasant majority of Mankind go in adopting Western scientific methods of agriculture and in accepting limitations on a traditionally sacrosanct right and duty of procreation? These questions are probed further in a later chapter,¹ and the outcome of our examination of them there need not be anticipated at this point except for reporting that, at the time of writing, it seemed premature to expect to find precise values for these two further unknown quantities in Mankind's current economic equation. At this stage the most that could be said was that the potential capacity of a latter-day

¹ On pp. 563-9 and 595-604, below.

Western technology to increase production perhaps virtually *ad infinitum* was running a race with the natural human refractoriness of the peasants and the industrial workers. The World's teeming peasantry was threatening to cancel the benefits of technological progress by continuing to raise the numbers of the World's population *pari passu* with each successive increase in the means of subsistence that Technology might achieve. The industrial workers were threatening to cancel the benefits of technological progress by restricting production through trade-union practices *pari passu* with each successive increase in the potentialities of productivity thanks to the triumphal march of scientific invention.

(II) THE SITUATION AFTER THE SECOND WORLD WAR

At the opening of the second half of the twentieth century of the Christian Era the outstanding feature in Mankind's situation on the economico-social plane in a world that was then undergoing a Western Industrial Revolution was a tug-of-war between a regimentation that was being imposed on Human Nature by the mechanization of the World's work and an obstinate human impulse to strive for freedom from regimentation, even if regimentation was the obligatory purchase-price of freedom from want.

The crux of the situation was the hard fact that, in Human Life, mechanization and police were as inseparable as Siamese twins. For Human Nature this was an unpalatable truth; yet any living observer of the age of sixty years or upwards who found himself shying at this truth would be compelled to look it in the face if, on any journey that he ever made by car, he compared the spectacle that now flashed past his eyes with his memory of what the traffic on the roads had been like in his childhood. Down to the close of the nineteenth century a trickle of horse-drawn and hand-pushed vehicles had been exempt from police control because it had been too slow and too thin to put life and limb in any serious jeopardy if drivers were left to their own devices. By contrast, on a twentieth-century road crowded with swift passenger-cars and ponderous lorries, travelling would have been, not merely perilous, but impracticable if the traffic had not been elaborately regulated, and if the regulations had not been strictly enforced. This change in the régime of the road, which we have noticed already in another context,¹ was an apt simile of the progressive encroachments on human freedom that were being imposed upon Mankind by a progressive increase in Man's command over Non-Human Nature and a consequent increase in the power-charge of men's actions in their encounters with one another.

An observer of this struggle between Technology's demand for discipline and Human Nature's recalcitrance to regimentation might find his impressions affected by the light in which he happened to be viewing the scene. From the technician's angle of vision the recalcitrant industrial workers' attitude might appear almost childishly unreasonable.

¹ In III. iii. 209-11.

Were these people really blind to a truth that was one of the truisms of Human Life? Had they never acquired the common knowledge that every desirable object has its price? Would they insist on demanding the 'freedom from want' which the technician's cornucopia could churn out, without reconciling themselves to the discipline that was the condition *sine qua non* for the successful performance of the technician's white magic? This indictment of the industrial workers' attitude might seem unanswerable to our observer so long as he was viewing the scene from the technician's standpoint; but as soon as he exchanged this for the historian's he might find himself seeing the same spectacle with different eyes. An historian would draw the spectator's attention to a string of historical facts. The Western Industrial Revolution had started in an eighteenth-century Great Britain; at that time and place an exceptionally high degree of freedom from regimentation on the economic-social plane had been enjoyed by at least a minority of the population, particularly by the Whig landlords and by the Nonconformist business men;¹ members of this economically free and powerful minority had been the creators of the industrial system of mechanized production; and the pre-industrial freedom of enterprise which these pioneers of Industrialism had inherited from a previous social dispensation had been the inspiration and life-blood of the new economic-social dispensation that their initiative had conjured into existence.

Moreover, the industrial *entrepreneurs'* pre-industrial spirit of freedom, which had been the *primum mobile* of the Industrial Revolution, continued to be its driving-force in the next chapter of the story; for, in the souls of the 'capitalists' who became the first masters of the new economic power-machine in virtue of having been its makers, this pristine *éthos* did not immediately succumb to the antithetical spirit of regimentation that was innate in their monstrous creature. While, however, the captains of Industry thus continued for a season to elude the fate of being crushed by a steam-roller of their own manufacture, this fate was the birthmark of the new urban industrial working class that the pioneers of Industrialism had called into existence to be the servitors of their new machines.² The industrial working class felt from the outset, in their full weight, the crushing effects upon human life of a triumphant Technology's success in mastering a previously intractable Non-Human Nature. In a previous context³ we have watched Technology liberating Man's economic activities from the tyrannies of the cycle of Day-and-Night and the cycle of the Seasons; but, in the act of

¹ The return of the English Nonconformists to power on the economic plane after their exclusion from power on the political plane has been noticed in III. iii. 334 and 358, n. 1.

² This new industrial working class in the interior of the Western World had been cursed with the same congenital unhappiness as the new intelligentsia in the Russian and other non-Western societies that had been caught in the Western Civilization's net; and the cause of the unhappiness was evidently the same in the two cases. Either of these two new classes had been called into existence artificially and hastily for the purpose of performing a new social function for which there was an urgent demand; and the society that had commandeered the new class's professional services had not provided for its new servants' human needs. Both the Industrial Proletariat and the Intelligentsia were, in fact, proletarians in the original sense of being 'in' Society without being 'of' it. For the Intelligentsia, see V. v. 154-9; for the Proletariat, see I. i. 41, n. 3, and p. 597, below.

³ On pp. 306-10, above.

setting Human Life free on one plane from an ancient servitude to the stars in their courses, Technology had been enslaving Man on another plane to Man himself by removing a buffer which Non-Human Nature had formerly interposed between the freedom of human souls and the impact on Man of Man's own collective material power.

In an agrarian economy out of which the new industrial working class had been uprooted, the incidence of Man's work upon Man's life had been rationed and regulated, not by a trial of strength between conflicting human wills championing divergent human interests, but by inexorably recurrent astronomical events—the fall of Night, the advent of Winter's frost or Summer's drought, the onset of the Monsoon—whose incidence *Homo Agricola* was impotent to elude. When these blindly beneficent non-human interruptions of Man's economic activity had been overcome by the invention of industrial plant capable of running without a pause for twenty-four hours in the day and for 365 days in the year, the workers in this plant found themselves under pressure of a new force—'heavy as frost, and deep almost as life'¹—that bore harder on human souls than any tyranny of Inanimate Nature to which they had ever been exposed. This unfamiliar force that had substituted itself for the vanquished forces of Nature was Man's own collective material power. It lost nothing of its psychic 'drive' in being brought to bear upon the lives of its living victims along the driving-belt of a physical machine; and in this perspective an industrial working class's recalcitrance to the demands of a technique that promised, at the price of discipline, to set Mankind free from want might wear the appearance, not of a perverse impulse to hinder Mankind from breaking the bonds of Non-Human Nature, but of an heroic struggle to keep human souls free from regimentation by Leviathan.

The trade-union organization and procedure that were the new industrial working class's characteristic contributions to the structure of the Western Society were, indeed, legacies from the same pre-industrial paradise of private enterprise that had bred the ethos and activity of the industrial *entrepreneurs*. Looked at as instruments for enabling the workers to hold their own in their struggle with their employers, the trade unions were, in fact, creatures of the self-same social dispensation as their 'capitalist' antagonists. Privately Organized Labour, no less than Privately Organized Capital, stood or fell with a régime in which the terms of trade and the distribution of the product of economic activity were determined by bargaining between private parties in a public arena in which the local state confined its intervention to the negative role of holding the ring for these private competitors. Freedom of private economic enterprise was the air which trade unions, as well as 'capitalist' employers of labour, breathed; and this truth had been demonstrated by the common fate of both these gladiators in states which, in the interval between the First and the Second World War, had been captured by totalitarian régimes.

In Russia after the Communist Revolution of A.D. 1917 the liquida-

¹ Wordsworth, W.: *Ode on Intimations of Immortality from Recollections of Early Childhood*.

tion of the private employers of labour had been followed by a *Gleichschaltung* of the trade unions; in Germany after the National-Socialist Revolution of A.D. 1933 the liquidation of the trade unions had been followed by a *Gleichschaltung* of the capitalists. Conversely, in Great Britain after the General Election of A.D. 1945, under a Labour government whose programme was to take the ownership of industrial enterprises out of private hands without trenching upon the sacrosanctity of personal freedom, the workers in the nationalized industries never thought of dissolving their trade unions or renouncing their right to promote their own private interests by means of collective bargaining backed by the sanction of collective strikes. In their dealings with the new public boards of management they plied these well-tried weapons as vigorously as they had ever plied them in their dealings with the state's private predecessors in the ownership of these particular means of production.

The diverse local histories of Great Britain, Germany, and Russia since A.D. 1917 thus presented, between them, a conclusive proof that the purpose for which the trade unions had originally been created, and for which they were still being maintained in all industrialized countries not yet captured by totalitarian political régimes, was to serve the workers as weapons in a struggle against regimentation; and, considering that the workers' will to freedom was thus not open to question, it was significant that the workers had not succeeded in finding any other effective means of resisting the pressure of a collective human material power than the desperate expedient of counter-regimenting themselves.¹ The pioneers of the trade-union movement had perceived from the outset that the workers' potential power of numbers was the one asset on their side that they could pit against the power derived by their employers from their control of the means of production. It had been obvious that this power of numbers could be made effective only through action that was both collective and disciplined; and thus the proletarian Western fathers of Trade Unionism, confronted by an aggressive Western capitalist dominant minority, had found themselves in the same dilemma as the non-Western fathers of Herodianism when these had been confronted by an aggressive Western World. The victims of aggression must either abandon the struggle or adopt their aggressive adversaries' weapons if they were to pursue the struggle with any hope of success; and accordingly the industrial workers had found themselves constrained to introduce their arch-enemy—regimentation—into the inner ward of their castle as an indispensable auxiliary in the defence of the outer ward against the assaults of the self-same adversary. They had had to impose regimentation upon themselves in order to resist its

¹ Professor William McNeill comments: 'Is there not a will to conform which is in constant tension with the will to freedom? I conceive of this tension as being parallel to the instinct of workmanship and the impulse to scamp work; and that most, if not all, men exhibit each of these contrary impulses in greater or lesser degree.'

The present writer would not deny the existence of this will to conform. He would merely suggest that in a mechanized twentieth-century Westernizing World the loyalty of the trade unionist, as against the skill of the craftsman, was the ideal towards which a perennial will to conform was steering a majority of the living generation of industrial workers.

imposition upon them by their employers, and this tragic paradox was a demonstration of a rampant Technology's unholy power to regiment human souls by hook or by crook.

The workers had been moved to resist regimentation by the same spirit of freedom, inherited from a pre-industrial past, that had inspired the *entrepreneurs* to make the Industrial Revolution and thereby to put the workers under pressure; and this pre-industrial ethos had been the psychic counterpart of an economic dispensation in which each individual worker had at least seen the results of his labours, even when he had not reaped the reward, and had therefore found himself able to work with zest—not because he had been able to count upon pocketing an equitable share of the profits of his own exertions, but because, even when he had been sweated and fleeced, his work had been intrinsically effective and significant and therefore psychologically satisfying. By contrast, under an industrial economic dispensation under which the pressure of the work upon the worker had, as we have seen, become overwhelming owing to the removal of ancient automatic safeguards, the *chefs-d'œuvre* of Technology that had swept those safeguards away had mechanized the processes of Industry to so high a degree, and had carried the Division of Labour to such extremes, that the factory hand's work had become intrinsically impersonal, monotonous, and infantile.

'We invent the machinery of mass-production, and, for the sake of cheapening the unit, we develop output on a gigantic scale. Almost automatically the machine delivers a stream of articles in the creation of which the workman has had little part. He has lost the joy of craftsmanship, the old satisfaction in something accomplished through the conscientious exercise of care and skill.'¹

The effect of these psychologically untoward technological improvements had been, inevitably, to make a worker's attitude towards his work defensive and negative, like a schoolboy's attitude towards an uncongenial imposition.²

Thus the workers' resistance to regimentation at the hands of an external power had driven them into regimenting themselves. In fighting against the fate of being turned into robots in the factory, they had imposed on themselves the fate of serving as soldiers in a trade-union phalanx; and at the time of writing it was not easy to see how either fate could be exorcized, for by this time it was already evident that the external pressure on the industrial workers could not be relieved by the

¹ Sir Alfred Ewing in a presidential address delivered on the 31st August, 1932, at York, to the British Association for the Advancement of Science. Another passage of this address has been quoted already in this Study in III. iii. 211.

² Professor William McNeill comments: 'Is there not an instinct of workmanship that may act as an antidote to the trade unionist and civil servant spirit?' The present writer would not deny either the existence of this instinct or its pertinacity. He would merely suggest that, in a mechanized twentieth-century Westernizing World, Technology was tilting the balance adversely for the instinct of workmanship and favourably for a workers' resistance movement against the social effect of physical machinery which, at the current power of its 'drive', was threatening to serve as an instrument for placing the would-be craftsman at the mercy of a collective human social pressure instead of promising to serve as a tool for enabling him to express his own individuality in and through his work.

comparatively simple measure, on which such high hopes had once been set, of taking the means of production out of private hands.¹

This was no radical remedy because, under the industrial dispensation, the private employer was in truth no longer the ultimate villain of the piece. Oppression by profiteering private employers or by rack-renting private landlords had, after all, been the lot of many workers in the histories of many societies, including the Western Society itself, in the days before the advent of a Western Machine Age; and before this Western Industrial Revolution, as well as after it, economic oppression had provoked resistance among its victims. Yet, under those pre-industrial dispensations, this resistance had never organized itself on trade-union lines and had never displayed the trade-union spirit; and the explanation of these new departures in the character of the resistance movement was that under the new industrial dispensation the personal oppressor who was the workers' familiar bugbear had been reduced, by his own revolutionary achievement, from his age-old status of being one of the principals in a conflict between two human antagonists to the novel status of being merely the personal agent of an impersonal force. The pressure against which the industrial workers were reacting could not be removed by eliminating the private employer, because this was a new pressure inherent in the new technique of machine industry. So costly an initial capital investment could not be made to yield an economically adequate return on the outlay unless the wheels were kept revolving at full speed, night and day, year in and year out; and, while it was true that a private owner of the plant would therefore be bound to press the human tenders of these Satanic mills to make the utmost exertions that the management could wring out of them, any public owner—municipality, community, or state alike—would be bound for the same reasons to do likewise.

Thus the change from private to public ownership could not abate a pressure that was being exerted on the industrial workers by the impersonal force of a mechanized technique; and, indeed, the representation of this impersonal oppressor by a public instead of a private agent made the trade unions' task of conducting the workers' resistance movement a more difficult one psychologically and politically. In contending with the *ci-devant* private employers before the bar of public opinion, the trade unions had been able to put their adversaries 'on the spot' by manœuvring them into the invidious role of harpies who were so bent upon grinding the faces of the poor that, rather than give the workers their due, they were prepared to deprive the public of essential economic services by forcing the workers to resort to a strike as their only practicable means of redress. It was not so easy to bring odium upon a public authority by accusing it of being actuated by motives of personal cupidity. A public authority was indeed as awkward

¹ This was not to say that in a mechanized society it was right or wise or feasible to leave Private Property uncurbed now that this traditional institution was being charged by the new social force of Industrialism with an unprecedentedly powerful new 'drive'. This point has been touched upon in IV. iv. 191-2. The measures for curbing Private Property, without abolishing it, that were being taken in Great Britain on the morrow of the Second World War are noticed on pp. 588-92, below.

an antagonist for a trade union as Peer Gynt's legendary obstructor the Böig.¹ The industrial workers' ultimate adversary was an impersonal collective human material power which was both more potent and more elusive than a personal villain; no man knew how to put asunder a Leviathan that the Western Industrial Revolution had joined together;² and this last enemy might well prove to be almost as tenacious as Death.³ Indeed, the constant, and at the same time constantly accelerating, progress of Western technological invention—a progress of which the end was not, as yet, in sight—threatened to continue to key up the pressure on the industrial workers to ever higher degrees of severity; and the response of the workers to this mounting challenge seemed bound to be a progressive accentuation of the trade-union movement's characteristically defensive and negative *éthos*.

If this probable aggravation of the inauspicious elements in the industrial workers' spirit was a gloomy prospect, it was also an awe-inspiring spectacle to see the Western middle class beginning to take a road on which the Western working class's feet had been set long since. The period between the achievement of the Industrial Revolution and the outbreak of the First World War in A.D. 1914—a period that had lasted for about a century and a half in Great Britain and for about half a century in Germany and in the United States—had been the Western middle class's golden age; but the new era which the First World War had inaugurated had seen this Western middle class fall, in their turn, into the adversity to which the Industrial Revolution had condemned the industrial workers in the act of calling them into existence.

In the twentieth-century history of the Western middle class the liquidation of the bourgeoisie in Russia in and after the Bolshevik Revolution of A.D. 1917, which had been the first portent in a series, had not been the most significant one; for Russia was a recently and imperfectly Westernized country in which the Western social phenomenon of a bourgeoisie had been something exotic. The bourgeoisie in Germany that had been ruined after the War of A.D. 1914–18 by the social and economic consequences of Germany's military defeat had, by contrast, been part and parcel of the native Western middle class; but this local disaster might perhaps be interpreted as being the special nemesis of the German bourgeoisie's peculiar perversity, and might then be written off as one of those 'partial events' that could not 'essentially injure' the Western middle class's 'general state of happiness'.⁴ A more accurate index of the fortunes and tendencies of the Western middle class in this age was to be found in the contemporary social histories of Great Britain and the other English-speaking countries, since in these countries the middle class was as deeply rooted as it was anywhere in the Western World, while, in contrast to its fate in the Continental Western countries, it had suffered less severely in

⁴ See Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, 'General Observations on the Fall of the Roman Empire in the West', at the end of chap. xxxviii.

the English-speaking countries—and this even in Great Britain—from the direct impact even of the Second World War. The recent history of the middle class in the English-speaking countries thus seemed more likely to reveal the 'secular' trend of the Western middle class's current social evolution, in so far as it might be possible to identify this social trend by isolating it from contemporaneous military and political vicissitudes. It was therefore significant that in the English-speaking countries too—in Great Britain first and foremost, but also in the rest in divers degrees—this age had seen the middle class begin to lose both its nineteenth-century prosperity and its sanguine pre-industrial *éthos*. The psychological change was more portentous than the economic, since it was in virtue of its pre-industrial *éthos* that the middle class had made the industrial fortune that was now slipping out of its hands.

During the period between the Industrial Revolution and the outbreak of the First World War, the distinguishing psychological characteristic of the middle class, by contrast with the contemporary spirit of the clerical workers as well as the industrial working class, had been its unabated zest for work.

In the citadel of Capitalism on Manhattan Island there had been a trivial yet significant illustration of this difference of attitude as recently as the year A.D. 1949. In that year the financial houses on Wall Street were trying, without success, to induce their shorthand-typists, by offers of special remuneration at high overtime rates, to reconsider a collective decision to refuse henceforth to attend at their offices on Saturday mornings. The shorthand-typists' employers were eager to devote their own Saturday mornings to work for the sake of retaining the profits that they would forfeit if they were to submit to this shortening of their own working week; but they had ceased to be able to do their own work without having shorthand-typists in attendance to assist them, and they found themselves unable to persuade these indispensable collaborators in their business of money-making that the game of working on Saturdays was worth the candle. The shorthand-typists took the stand that one day's, or even one half-day's, additional leisure was worth more to them than any monetary inducement for withdrawing their demand for this amenity. Additional money in their pockets was of no use to them if they had to earn it at the price of forgoing the additional leisure without which they would have no time for spending it. In this choice between money and life, they opted for life at the cost of letting the money go, and their employers did not succeed in persuading them to change their minds. By A.D. 1952 it had begun to look as if, so far from the Wall Street shorthand-typists ever being brought round by a monetary inducement to the Wall Street financiers' point of view, the financiers might eventually be converted by economic adversity to the standpoint of the typists; for by this date even Wall Street was beginning to feel a breeze that had already chilled once sanguine hearts in Lombard Street.

In the twentieth century of the Christian Era the Western middle class's opportunities for doing profitable business were being progressively reduced in one Western centre of capitalist activity after another;

and these economic reverses were having depressing effects upon the middle-class *éthos*. The middle class's traditional zest for work was now being sapped by a progressive restriction of the field for private enterprise and a progressive regimentation of the remnant of private enterprise that was being permitted provisionally to survive. Inflation and taxation were conspiring to make nonsense of the sovereign middle-class virtues of strenuous earning and thrifty saving by robbing these ascetic activities of their sybaritic rewards. A rising cost of living was conspiring with a simultaneously rising standard of living to reduce the size of middle-class families. The loss of personal domestic service was threatening to undermine the middle class's professional efficiency. The loss of leisure was threatening to undermine its culture.

These blows that were raining down upon a twentieth-century Western middle class were hitting the man in the office less hard than the woman in the home; for, in order to make both ends meet when a falling income was failing to keep abreast of a rising budget, a middle-class housewife might find herself compelled—like so many working-class housewives in an earlier phase of the Industrial Age—to do two men's work by keeping house and earning a salary simultaneously. Neither a reduction in the size of middle-class families nor an improvement in domestic labour-saving contrivances could avail to save the middle-class married woman from being saddled with a burden of overwork from which her husband was exempted by a physical disability to bear children and by a degree of professional specialization which (in West European countries, though not in the United States) restricted his competence to be a help in the house. By contrast, his wife, who was still the only member of the family partnership who could bear and bring up the children and could make the house a home, had now also won for herself the opportunity of widening her horizon, or had exposed herself to the liability of adding to her labours, by taking on 'men's work' as well, thanks to the provision of higher education for girls as well as boys in Western countries within the last hundred years. In the very generation in which these new educational facilities had made it possible for middle-class women to take up professional careers in a world of affairs that had previously been the male sex's monopoly, the self-same social and economic revolution had deprived them, in their homes, of the paid help of domestic servants, and unpaid help of maiden aunts, sisters, and daughters, which had been enjoyed by middle-class married women of earlier generations who had had no duties or interests outside the domestic circle; and these two contemporaneous but antithetical changes in her circumstances had placed the highly educated and professionally competent twentieth-century Western wife and mother in a dilemma in which the acceptance of either of two alternatives spelled frustration. She found herself confronted with an unhappy choice between resigning herself to be a household drudge, without the leisure to turn her education to any account, and forcing herself to carry the intolerably heavy load of two simultaneous full-time jobs. In the Western middle class's twentieth-century crisis, as in the Western working class's nineteenth-century crisis, the

wife and mother was, in fact, both the heroine and the victim of the tragedy.¹

Meanwhile the Western middle-class woman's brother, husband, and son were in process of making a change of professional occupation which entailed a corresponding change of attitude and outlook. A nineteenth-century social and economic revolution in the life of the Western working class which had transported the manual worker from the field to the factory, and had transmuted his *êthos* from the husband-man's into the trade unionist's, was now finding its counterpart in the history of the Western middle class in a twentieth-century revolution which was turning private business men and professional men into employees of governments or of non-governmental business concerns that were almost equally impersonal because they were on an almost equally large scale;² and this change from being their own employers to being Leviathan's employees was producing a corresponding change of *êthos* in these middle-class workers' souls in their turn.

The twentieth-century Western middle class's progressive exodus out of private enterprise into public service or into its psychological equivalent in the service of giant non-governmental corporations had been bringing with it gains, as well as losses, for the Western Society. The principal gain—and this was a notable one—was the subordination of the egoistic motive of making personal economic profits to the altruistic motive of serving the public interest; and the social value of this change of personal objectives and moral ideals could be measured by the effects of corresponding changes in the histories of other civilizations in which the sequel was on record. In the histories of the Hellenic, Sinic, and Hindu civilizations, for example, the social rallies inaugurated by the establishment of universal states had been signalized and achieved—in so far as the credit for a complex corporate achievement can be assigned to any one of the contributing factors—by the redirection of a hitherto predatory class's ability and experience to serve social, instead of anti-social, ends.³ Augustus and his successors had made good civil servants out of predatory Roman business men of the 'equestrian' class; Han Liu Pang and his successors had made them out of predatory feudal gentry bred by the contending Sinic parochial states; Cornwallis and his successors had made them out of predatory commercial agents of the British East India Company.

The beneficence of the social effects of these acts of moral redemption had been proportionate to the magnitude of the spiritual revolution in each case. Yet, in each case likewise, the social rally signalized in a universal state had been ephemeral; and a good civil service had so far

¹ At the cost of bearing this excessive burden, the women members of the Western Society in its post-Modern Age had won for themselves a position in which the World's work, outside as well as inside the home, would have come to a standstill if the women had gone on strike. The simultaneous entry of the women and the industrial workers upon the stage in this act of the drama of Western history had its parallel in Hellenic history in the likewise simultaneous entry of the women and the slaves upon the stage in a post-Alexandrine Age.

² Professor William McNeill comments: "The transformation of the owner-manager-entrepreneur into the salaried manager is very striking in the United States and elsewhere, and is almost, if not quite, as significant as the rise of the civil service itself."

³ See V. v. 35-58.

never proved able to stage a recovery from more than a single relapse, and therefore never able to avert the ultimate dissolution of a disintegrating society. This ultimate failure of a mission that had achieved so striking an initial success was to be explained, in these previous cases, by the ambivalence of a civil-service *éthos* in which the sovereign virtue of moral integrity was counter-balanced by a lack of zest, a disinclination to take the initiative or to incur risks, and an impulse to play for personal safety which could militate against the public interest as severely as a thirst to acquire personal power and wealth; and these inauspicious defensive and negative characteristics of an historic civil-service *éthos* were all now being displayed by twentieth-century Western middle-class civil servants who, at the time of writing, were serving, in the administration of parochial *peritura regna*, an apprenticeship for their future task of organizing and maintaining a world government.

When we look into the causes of a civil-service *éthos* which the twentieth-century Western civil servant thus shared with his professional counterparts in the histories of other civilizations, we find that this *éthos* was the response to the challenge of pressure exerted by a machine which bore no less hardly upon human souls for being constructed out of psychic instead of metallic materials. To tend the machinery of a highly organized state administering many millions of subjects was, indeed, as soul-destroying a task as stoking a furnace, minding a power-loom, or performing a repetitive set of scientifically managed physical movements in an assembly plant. The sheer magnitude of the scale of civil-service operations dwarfed and dominated any single concrete piece of civil-service business, with the consequence that, in any official action which a civil servant had to take, his decision was apt to be determined less by the actual merits of the case in point than by a calculation of the precedents which this or that course of action might or might not create.

This effect of the administrative machine in setting a negative rather than a positive impress on its servants' *éthos* was enhanced by the vein of caprice and tyranny in the *éthos* of any public administrative machine's sovereign lords and masters. One of the arch-fallacies in a nineteenth-century Western optimistic estimate of the capabilities of *Homo Politicus* had been the fatuous postulate that the occupational vices of an individual autocrat would be automatically exorcized by the trick of putting autocracy into commission. The truth was that an enlightened individual autocrat, however rare a bird he might have been, had proved himself, by occasional visitations, to be a bona fide natural species, whereas the legendary nineteenth-century enlightened parliament or electorate was as chimerical a figment of the imagination as Sinbad's Orc or Herodotus's Phoenix.

In their short history up to date, Western parliaments elected on a wide franchise had quickly betrayed their historical paternity by emulating the bad behaviour of an English King Henry VIII and a French King Louis XIV; these parliamentary corporate despots' constituents had been lax or incompetent in exercising their constitutional

right and duty of bringing their elected representatives to book; the brunt of the consequent corporate abuse of power by parliaments had fallen upon their slave-household of civil servants; and the effect of this arbitrary parliamentary régime on the administrative action of these latter-day Western civil servants who found themselves in the plight of an Ottoman Pādishāh's *qullar* had been to set up a second impediment to the decision of cases on their merits; for if the first question that a conscientious civil servant must ask himself was 'What awkward precedents for the service might this decision create?' the second question that a cautious civil servant must ask himself was 'What awkward parliamentary questions for me might this decision evoke?' There were thus two irrelevant stumbling-blocks to be surmounted before the merits of a case could obtain consideration from the civil servant who would be called to account eventually over the outcome of whatever action had been taken or been withheld on his advice; and, since, in becoming a civil servant, he had not ceased to be a human being, it was inevitable that his conduct should be influenced by a personal anxiety to be in a strong position in any future reckoning, as well as by an impersonal concern not to compromise the interests of the public service by creating an unfortunate precedent.

It was also inevitable that civil servants should take personal advantage, against the public interest, of a notorious trait of parliamentary psychology. Civil servants had learnt from a long experience that, while a parliament was usually quick to notice and resent even the slightest damage to the public interest that might be traceable to a civil servant's recommendation of some positive action, the same corporate autocrat could usually be trusted not to visit upon a civil servant any proportionately condign punishment for a sin of omission, even when the sinner's failure to perform his public duty of recommending that positive action should be taken had been the cause of a public catastrophe. This bad habit of parliaments was as pertinent to the civil servant's professional work and personal interests as it was irrational in itself and inimical to the common weal; and a parliamentary practice of putting a premium upon sins of omission thus worked together with an administrative concern for the avoidance of awkward precedents to write 'Thou shalt not' into the exordium of each commandment in the civil servant's decalogue.

It would thus appear that, in the twentieth century, the psychic steam-roller of a ponderous public administration was crushing the business man turned civil servant as remorselessly as, in the nineteenth century, the metallic steam-roller of a ponderous industrial plant had crushed the husbandman turned machine-tender. A pressure that had made the industrial worker curl up like a hedgehog had made the civil servant mortify himself like a monk; two defensive reactions that were so widely diverse in their outward manifestations were nevertheless substantially identical in their psychological effect; and this pervasive psychological consequence of a penetrating technological revolution was inauspicious for the prospects of the Western Society in whose bosom this revolution had taken place.

While the breaking of the spirit of any class was, of course, bound to be damaging to the spiritual health of any body social in which this spiritual disaster occurred, the damage already suffered by the Western Society in consequence of the nineteenth-century tribulations of its working class might prove not to have been so grave as the further damage that the Western middle class's twentieth-century tribulations were now threatening to inflict upon an already ailing Western social constitution. The progressive depotentialization of the Western middle class's characteristic pre-industrial spirit was fraught with a serious threat to the stability, and even to the survival, of a world-wide Westernizing industrial society, because the Western middle class was the heart of this oecumenical body social;¹ it was the creative minority that had originally brought this body social into being and had subsequently kept it alive; and it had achieved all this in virtue of being animated by the pre-industrial *êthos* that was now showing signs of succumbing to the pressure of the same impersonal collective human material power that had already crushed the Western working class. 'A little leaven leaveneth the whole lump',² and 'salt is good';³ 'but if the salt have lost his savour, wherewith shall it be seasoned?'⁴

In the cosmic imagery of an Atomic Age the pre-industrial temper of the Western middle class might be likened to the physical tone of the inner core of the Sun. In that titanic physical power-house in the current aeon, the temperature stood at a height at which the physical effect was a continual annihilation of atoms; this physical process was perpetually releasing a physical energy of enormous potency; and the discharge of this energy into the Sun's field of radiation might produce utterly diverse effects on any physical object that the out-streaming waves encountered in their passage, according to the distance of this object from the radiating energy's solar source and the corresponding degree of the energy's intensity at the moment when it made its impact.

A solar energy whose genial warmth had rendered it physically possible for Life to make its epiphany, and thereafter to maintain itself in being, on the surface of the planet Terra, might nevertheless one day fulfil the cosmological predictions of the Stoic school of Hellenic philosophers by melting the same planet into a gaseous vapour if a school of mid-twentieth-century Western cosmologists was right in predicting that the Sun was destined, in one of the future chapters of its history, to swell to a size at which it would envelop not only the Earth but also some, at least, of the remoter planets.⁵ On the other hand, when, in a further chapter, subsequent to that, the Sun shrivelled and cooled into a 'black dwarf'—and this was believed by Western astronomers at this date to be the inevitable ultimate destiny of every star ever spawned in any nebula—the solar furnace would then have lost, utterly

¹ This indispensable role of the Western middle class in the life of a Westernizing World Society could have been conveyed by an Hellenic political scientist, without resort to a simile, by saying that the Western middle class was the *πολίτευμα* (i.e. the effective and responsible governing body) of an oecumenical *πολιτεία*.

⁵ See Hoyle, Fred: *The Nature of the Universe* (Oxford 1950, Blackwell), p. 40.

and forever, its once seemingly inexhaustible capacity to radiate energy either for the weal or for the woe of terrestrial living creatures. 'Fear no more the heat of the Sun' would then be Everyman's posthumous consolation; and the exhaustion of the Sun's energy, which would thus have guaranteed any survivors among the dead star's planets against the danger of a repetition of a life-destroying conflagration, would also have extinguished all hope of any return of a genial warmth which, in the chapter before that, had given Life on Earth its opportunity.

This story—true or fabulous—of successive vicissitudes in the intensity, and consequently in the effect, of a physical energy radiating from the Sun might serve as a parable to expound the Western middle class's role in the Modern and post-Modern chapters of Western history. Here was an element in the Western body social whose radiant energy had threatened in the sixteenth century to consume all the non-Western civilizations on the face of the *Oikoumenê* in a veritably Zenonian cultural world-conflagration, and had then threatened in the nineteenth century to consume a native Western working class in the burning fiery furnace of an Industrial Revolution. Now that, in the twentieth century, the temperature of this Western middle-class psychic energy was being reduced to a milder degree through the conversion of the children of predatory buccaneers and *entrepreneurs* into conscientious civil servants and employees of giant non-governmental business concerns, had not the rest of Mankind, whom the fathers had ruthlessly ground down into a proletariat, good reason to rejoice at the children's change of heart? In the light of our parable we may be inclined to reply that the answer to this question must depend upon the length of the view that the observer of the Western middle class's metamorphosis might be able and willing to take. On a short view, the current abatement of the psychic temperature of the Western middle class was, on balance, possibly proving beneficial for the Western body social as a whole; but suppose that the welcome transformation of an incinerator into an incubator should prove to be merely one brief stage in a 'secular' cooling process that would eventually transform the incubator into a refrigerator, what, on this longer view, would be the significance of the 'secular' process for the Western Society's ultimate prospects?

The significance for the prospects of the current 'capitalist' system of Western economic life was not so difficult to gauge. The Western middle class's fund of pre-industrial psychic energy had been 'Capitalism's' driving force; and, if this energy was now being depotentiated and at the same time diverted from private enterprise into public service, this process unquestionably spelled Capitalism's doom.

'Capitalism is essentially a process of (endogamous) economic change . . . without innovations, no entrepreneurs; without entrepreneurial achievement, no capitalist returns and no capitalist propulsion. The atmosphere of industrial revolutions—of "progress"—is the only one in which Capitalism can survive. . . . Stabilised Capitalism is a contradiction in terms.'¹

At the opening of the second half of the twentieth century of the

¹ Schumpeter, J. A.: *Business Cycles* (New York 1939, McGraw-Hill, 2 vols.), vol ii, p. 1033.

Christian Era it looked as if the regimentation inexorably imposed by a latter-day industrial Western technology might be taking the life out of a pre-industrial spirit of private enterprise in economic affairs by which the Western Industrial Revolution had originally been brought to birth; and this prospect opened up further questions, which were more enigmatic, as well as more important, than any questions about the future of the Western Capitalist system or the Western middle class. Would the technical system of mechanized industry be able to survive the social system of private enterprise which had brought it into operation originally and had kept it in operation hitherto?¹ And, if a Western mechanized industry were to prove unable to survive the death of Western private economic enterprise, would the Western Civilization itself be able to survive the death of a mechanized industry to which the Western Society had now given hostages by allowing its population to increase in the Machine Age far beyond the numbers that any non-industrial economy could support?

It was indisputable that the Industrial System, like any other technique, could work only so long as there was some fund of creative psychic energy to drive it, and that, hitherto, this psychic driving-power had been supplied to the Western industrial system by the energy of the Western middle class. The ultimate question therefore seemed to be whether there was some alternative source of psychic energy, employable for the same economic purposes, on which a Westernizing World could draw if the Western middle class's energy were to be depotentiated or diverted. If a practical alternative was within sight and within reach, the World could perhaps afford to look forward with equanimity to the possibility of the capitalist system's demise. On the other hand, if there was no such alternative on the horizon the outlook would be disconcerting; for Mankind might then have to reckon with the possibility that a Mechanized Technology might contain within itself the psychic seeds of its own decay. If mechanization spelled regimentation, and if this regimentation had taken the spirit out of a Western industrial working class and a Western middle class in succession, was it possible for any human hands to handle 'the accursed thing'² with impunity? The answer to this mid-twentieth-century question, whatever the answer might be, was pregnant with the Western Civilization's destiny.

(III) ALTERNATIVE POSSIBLE APPROACHES TO SOCIAL HARMONY

The social problem confronting Mankind on the morrow of a Second World War was being approached from different angles by divers members of a Westernizing Society that, on the economic plane, was already oecumenical in its range. One approach was being made in

¹ Professor William McNeill comments: 'I cannot think that there is much likelihood of a decay of established technology as a consequence of the decay of individual initiative. There may well be, however, a decrease in the *rate* at which new inventions are made and introduced, as bureaucratic habits of thought spread and harden themselves.'

² Joshua vi. 18.

North America, another in the Soviet Union, and a third in Western Europe.

The North American approach (which was shared with the peoples of the United States by the English-speaking element in the population of Canada) was inspired by the ideal of creating an Earthly Paradise in a New World. 'The lot is fallen unto me in a fair ground; yea, I have a goodly heritage.'¹ The motive that had moved the ancestors of the living generation of Americans to pull up their roots in the Old World and to make a fresh start in life on the farther side of the Atlantic had been a hope of being able to leave behind them the tares in their social heritage and to sow an American crop in which there should be nothing but wheat;² and in American eyes freedom for private enterprise in economic affairs was one of those good things in America's heritage from the Old World that were to be, not discarded, but transplanted. The American people believed in private economic enterprise wholeheartedly, and they were confident of being able, in their New World, to allow private economic enterprise to retain the freedom that was its life-breath without exposing themselves to the inconveniences and abuses that had been bred by private enterprise in the Old World when its freedom had there been left unrestricted.

In their New World the Americans claimed to have found a practical solution for a social problem which in the Old World had proved intractable. They claimed to have succeeded in getting rid of class-conflict in an industrial society, not by the inhuman and uneconomic crime of liquidating the middle class, but by building up a classless society on a middle-class footing. As middle-class Americans saw it, the American way of life had satisfied all reasonable demands for social justice that the industrial workers could make by raising the minimum standard of living in North America to at least the West-European middle-class level and by providing every industrial worker who chose to exert himself with opportunities for rising into the middle class, or at least with opportunities for educating his children into a middle-class career. The proof of a pudding is in the eating; and the social success of the American way of life was demonstrated (so its middle-class American advocates would contend) by the industrial workers' attitude. They were (it was asserted) much more eagerly concerned to change their momentary station in life for a better one than to spend their energies in striving for improvements in the conditions of the transitional station in which they happened at the moment to find themselves.³

The strong point in this North American approach to the social problem of an industrial society was its recognition of the truth that the energy which had set the wheels of a mechanized industry turning was the psychic energy generated by the pre-industrial *éthos* of the

¹ Ps. xvi. 6.

² See p. 545, above.

³ Professor William McNeill comments: 'I feel that your description of the American response to the problem of class-conflict [as seen through middle-class American eyes in A.D. 1952] is valid only for the period before A.D. 1929. I feel that the differences between the United States and [Western] Europe are growing much narrower, and this in both economic and cultural organization and activity. In general the United States lags a bit behind the more advanced [West] European nations in its internal development, but surely it has been catching up, and doing so rapidly over the past generation.'

Western middle class. Middle-class Americans had grasped this truth, and they were determined at all costs to preserve the middle-class spirit of private enterprise by preserving the middle-class way of life, because they were alive to the danger that the energy which had originally made the Industrial Revolution and which was now keeping going the Industrial System of economic production might be paralysed by the rise and spread of the defensive, negative, unenthusiastic trade-union and civil-service *éthos*.

The weak points in the North American approach are all implicit in Horace's observation that 'coelum, non animum, mutant qui trans mare currunt'.¹ The American hope of being able to create an Earthly Paradise was founded, as we have noticed, on a belief in the possibility of being able to leave the Old World behind by making the transit of the Atlantic, and this belief was an illusion; for the Old World was not a physical continent whose dust the Pilgrim Fathers could shake off² as they took to their boats; it was the spiritual burden of Original Sin, which Christian had to carry with him to a stage in his progress that was far in advance of the farthest point normally attained by *l'homme moyen sensuel* on either side of the Atlantic.

The Old World in this haunting spiritual sense of the term had crossed the Atlantic into the New World of North America in the souls of the first settlers from Europe on North American soil; and Original Sin made havoc of the sanguine middle-class American belief that the claims of social justice could be satisfied by a guarantee to all men of an absolute minimum standard of living, however high that standard might be set; for human standards are never absolute and objective; they are always subjective and relative; and it is not in Human Nature for one man to be content with his own standard, whatever its height, if his neighbour's standard is conspicuously higher. The cause of class-conflict thus lay, not in the inadequacy of the absolute standard of the lowest class in the scale, but in the inequality between the standards of the lowest class and the highest; this law of Human Nature was no less valid west of the Atlantic than east of it; and, if the proof of the pudding was in the eating, there was another side to the attitude of the American industrial workers which militated against the contention that in North America the class-conflicts of the Old World had been exorcized by a new American way of life. It was both incontestable and significant that the height of the minimum standard of living enjoyed by industrial workers in North America, and the abundance of the opportunities open to them for rising into the middle class, had not made the North American working class proof against succumbing to trade-union practices and the trade-union *éthos*.

Moreover, an Old World that had invaded the New World of North America in the seventeenth century in the inward spiritual form of Original Sin had launched a second wave of invasion in the twentieth century in a form which, by comparison, was material and superficial, yet which nevertheless was importunately intrusive. The geographical

² Matt. x. 14; Mark vi. 11; Luke ix. 5 and x. 11; Acts xiii. 51 and xviii. 6.

coalescence and shrinkage of the *Oikoumenê* in the twentieth century as a result of a latter-day Western technological revolution¹ had put an end, even on the physical plane, to an isolation which, on that plane, had in truth been achieved partially and temporarily by West European settlers in North America whose boasted insularity had never, on the spiritual plane, been anything but a pure illusion.

The issue between an ideal of American insularity and an ideal of oecumenical human solidarity had been the most important issue in the history of the United States, and this was both a moral issue and a practical one. Was it possible to insulate the United States from the rest of the *Oikoumenê*? And, if it was possible, was it also right for Americans to make this one of the aims of their national policy?

The possibility of isolating the United States from the Old World had been open to question long before the Old World had closed in upon America on the physical plane as a consequence of twentieth-century Western Man's technological feat of 'annihilating distance'. The novel amplitude of the opportunity in the United States for rising in the social scale had, for example, been created by a stream of immigration from the Old World which had flowed, and this in an ever-increasing volume, for nearly a hundred years ending in A.D. 1914. Each annual influx of immigrants, as it poured into the sump of the American melting-pot, had buoyed up all the layers of immigrant population that had preceded it, and each of the annual contingents had been able to count upon being buoyed up, in its turn, by all the future annual influxes that were to follow. In the nineteenth century an American family's rise in the social scale had thus been almost automatic at every level in the structure of a social pyramid that was being jacked up and underpinned by the importation of a fresh layer of immigrant population year by year; and the same reservoir of population in the Old World that had ensured this rise by feeding an inflowing stream of immigration into the United States had also ensured a livelihood for the increasing population of the United States by providing a market for the increasing abundance of commodities that these new hands in a New World were producing through the exploitation of hitherto untapped American natural resources.

Thus, on the economic plane, the New World in North America had still been part and parcel of the Old World east of the Atlantic in the nineteenth century, even more conspicuously than in the eighteenth and the seventeenth. In the nineteenth century the United States had developed her new estate by importing man-power and capital from the Old World's surplus stores and exporting resultant American products to the Old World's markets; and, though successive approximations towards the achievement of North America's economic independence had been marked by the raising of the height of the United States' tariff wall during and after the Civil War and by the cutting down of the volume of immigration into the United States after the First World War, this approach towards autarky on the economic plane had been offset on the political plane by an increasing entanglement in inter-

¹ See pp. 479-90, above.

national politics that had been made dramatically manifest when the United States had found herself compelled to become a belligerent in two world wars in succession.

Looking back in A.D. 1952 over the history of the United States since the Declaration of Independence, an historian could see in retrospect that, on the political plane, the United States' long-protracted endeavour to keep out of the arena of Western international power politics had been a losing battle. Since A.D. 1941 the United States had become more deeply implicated in international politics than the Thirteen Colonies had been before they had severed their political connexion with Great Britain; and, while the question whether isolation was any longer a practical possibility was being answered for the American people in the negative by the *force majeure* of world-shaking events, the question whether Isolationism was a morally legitimate ideal was being answered in the same sense by the American people themselves in a national debate between the respective advocates of a policy of isolation and a policy of co-operation with like-minded peoples abroad for the establishment and maintenance of a world order. This domestic controversy in the United States was momentous for the oecumenical prospects of the Western Civilization, as well as for the national prospects of the United States herself.

The issue on which the American people had to take a decision had been ventilated, soon after the close of the Second World War, in a public discussion of the verbal question whether the twentieth century of the Christian Era should be described as 'the American Century' or as 'the Century of the Common Man'; for in spite of their brevity these two competing 'slogans'¹ brought out the essence of the issue when they were pitted against one another. Both slogans alike were inspired by the national American ideal of exorcizing the class-conflicts of the Old World by creating a classless society on a middle-class footing; their difference lay in a diversity between their respective conceptions of the range of the geographical field in which the endeavour to translate this ideal into an accomplished fact could and should be made; and even on this point the difference was not an irreconcilable discrepancy between incompatible programmes but was no more than a difference of emphasis. Yet a disagreement that was not irreconcilable was nevertheless crucial, for it raised the question whether the American ideal of creating an Earthly Paradise in a New World could and should be pursued within the political frontiers of the United States in isolation from the rest of the *Oikoumenê*, or whether it was neither morally right nor practically possible to draw the limits of the New World that was

¹ The original field of the competition in which these two slogans had been coined had been the domestic arena of American party politics. 'The American Century' had been coined (in an article published under this title in *The New York Times*, 4th March, 1941, pp. 14-15) by Mr. Harry Luce, who was one of the most successful living incarnations of a traditional American spirit of capitalist enterprise. 'The Century of the Common Man' had been coined (in a speech delivered at a 'Free World' dinner in New York on the 8th May, 1942), in reply to Mr. Luce's challenging slogan, by Mr. Henry A. Wallace, a leading champion of 'the New Deal' who had carried a traditional American spirit of liberal idealism to lengths at which this had eventually cost him the loss of his chance of being nominated as a candidate for the Presidency of the United States on the Democratic Party's ticket.

to be the site of the Earthly Paradise along any line short of the bounds of the *Oikoumenê* itself. Was the New World to be just a geographical expression, or was it to have a spiritual connotation? Was the new hope to be the monopoly of one fraction of Mankind that happened in the twentieth century to be domiciled within the frontiers of the United States thanks to the enterprise and foresight of its pilgrim forebears, or was it to be a hope in which the whole of Mankind could share? In working out their American way of life, had the American people been labouring for themselves alone, or had they been labouring for all Humanity?

A presciently affirmative answer to the second of these two questions had been given in the American people's name thirty-four years back by an American idealist speaking with the authoritative voice of a President of the United States. On the 30th May, 1917, fifty-four days after the date on which the United States had become a belligerent in the First World War, Woodrow Wilson had proclaimed America's conversion to an oecumenical interpretation of her mission in his Memorial Day address at the National Cemetery at Arlington.

'We have said in the beginning that we planned this great government that men who wished freedom might have a place of refuge and a place where their hope could be realised; and now, having established such a government, having preserved such a government, having vindicated the power of such a government, we are saying to all Mankind: "We did not set this government up in order that we might have a selfish and separate liberty, for we are now ready to come to your assistance and fight out upon the field of the World the cause of Human Liberty."'

In A.D. 1952 this great issue was being debated in the United States on a practical as well as on a moral level; Americans were asking themselves whether isolation was or was not now feasible, as well as whether Isolationism was morally right or wrong; but, in the contemporary American scene as this presented itself to at least one non-American observer, it seemed clear that the moral issue was paramount in American minds and that, unless and until Isolationism had been finally rejected by American consciences, American wills would not be disposed to capitulate to the importunate logic of events—however plainly manifest it might have become by this date that the American people would not have it in their power to construct an Earthly Paradise in North America in accordance with American specifications if they were to allow the collective economic, political, and military power of the Old World to be concentrated in the hands of a totalitarian government at Moscow whose blue-print for an Earthly Paradise was 'un-American' in every line. These practical considerations had, no doubt, been at work in American minds ever since the Japanese attack on Pearl Harbour had provided the crowning and conclusive proof that the United States could not contract out of international power politics by any unilateral action. Yet a thus forcibly enlightened regard for the United States' national self-interest had assuredly counted for less than an intuitive idealism in moving public feeling and opinion in the United States to support the Administration's historic decisions to join in founding the

United Nations Organization; to underwrite, in the proclamation of the Truman Doctrine, the territorial integrity and political independence of Greece and Turkey; to offer Marshall Aid to the peoples who had been hit the hardest by the Second World War; to make an improvement in the standard of living of the World's poverty-stricken peasantry an American concern (along the lines of President Truman's 'Point Four'); and to make the United States a party to the Atlantic Pact.

In any case there could be little doubt in A.D. 1952 of the direction in which American minds were moving, whatever the balance of motives might have been. Americans were coming to the conclusion that if they wanted the twentieth century to be 'the American Century' they must aim at making it 'the Century of the Common Man', not just within the frontiers of the United States, but throughout the *Oikoumené*. It did not follow from this that the American approach to a solution of the problem of class-conflict would in fact prevail, or would even prove feasible, everywhere. It seemed unlikely, *a priori*, that an approach which reflected the American people's own exceptionally fortunate economic experience and exceptionally successful economic achievements would prove to be practicable, *tel quel*, in the widely different current economic and social circumstances of the majority of the living generation of Mankind; and the American approach was in fact being challenged by alternative approaches reflecting other achievements and other experiences. The American solution for the problem of class-conflict might or might not eventually prevail in the World at large; at the time of writing, its oecumenical prospects were still unpredictable; it could, however, already be predicted with some confidence that, unless the American solution did prove to have some general value for the World at large, it would not be able ultimately to prevail even within the narrow enceinte of a North American fastness.

The Russian approach to the problem of class-conflict was inspired, like the American, by the ideal of creating an Earthly Paradise, and took shape, like the American again, in a policy of getting rid of class-conflict by eliminating class-divisions; but here the likeness ended; for the Russian and American lines of attack on a common objective were poles apart. While the Americans were trying to eliminate class-divisions by bringing the industrial working-class on to a middle-class footing, the Russians had eliminated them within the frontiers of the Soviet Union by liquidating the middle class and by banning all freedom of private economic enterprise, not only for 'capitalists', but also (in political practice, though not in constitutional theory) for Trade Unionism as well.

In this Communist Russian policy there were strong points which the Soviet Union's Western rivals in a competition for world power could not afford to underrate; and the first and greatest of these Russian assets was the *éthos* of Communism itself. In the long run, perhaps, this 'ideology'—offering, as it did, a stone for bread¹—might prove to be an unsatisfying substitute for Religion; and the disillusionment of one idealistic-minded Western convert after another who had embraced

¹ Matt. vii. 9; Luke xi. 11.

Communism in the belief that he had found in it Man's way of salvation was a portent which perhaps foreshadowed the eventual reaction of Mankind in the mass to the Marxian gospel. In the short run, on the other hand, Communism did offer to any soul whose house was empty, swept, and garnished¹ an immediate satisfaction for one of the deepest and most insistent of Man's religious needs by offering to the spiritual *déraciné* a purpose of high importance, transcending his own petty personal aims, as an object for his devotion. A Leviathan embodying the collective power and corporate interests of the Human Race was a more imposing idol than any of the individual mannikins whose trivial, ephemeral, and conflicting personal interests ranked as the ultimate goals of human endeavour under a post-Christian Western dispensation in which personal freedom had been cut loose from its religious origin, inspiration, significance, and sanction. Any hungry soul that was offered no objects for worship except these paltry Western idols and this imposing Russian one would be bound, when faced with that dismal choice, to opt for becoming a votary of Leviathan. The mission of converting the World to Communism was more inspiring, exhilarating, and edifying than the mission of keeping the World safe for the right to take profits or for the right to strike. 'Holy Russia' was a more rousing war-cry than 'Happy America'.

Another strong point in the Russian approach was that Russia's geographical position made it impossible for Russians to waste their energies, *more Americano*, by chasing the will-o'-the-wisp of Isolationism. The inextricable implication in the affairs of the rest of the *Oikoumenê* which was now overtaking the United States as a result of the *Oikoumenê*'s recent coalescence and shrinkage was a plight in which Russia had found herself since the dawn of Russian history. Isolationism was an ideal which could not be entertained by the inhabitants of a land-locked country. Russia marched with the domains of all the non-Russian civilizations of the Old World; and her frontier with the Western Society—which, in Russian experience, had been the most dangerous frontier of all—was a line drawn across an open plain where there was neither a mountain rampart nor a river moat to lighten the task of Russia's human defenders. The perilous exposure of her geographical location thus constrained 'Holy Russia', like the Biblical Israel with whom she was identified in her repressed but unexorcized Orthodox Christian tradition, to see herself as a Zion against whose Lord and His Anointed the Kings of the Earth would always be standing up and the rulers taking counsel together.² 'Why do the heathen so furiously rage together, and why do the people imagine a vain thing?'³ They rage because the Chosen People are the depositories of a unique truth and unique righteousness which the froward hearts of the wicked are bent upon challenging. 'Holy Russia's' defence was not any 'natural frontier' like the now rapidly narrowing Atlantic Straits that had once insulated the United States; it was orthodoxy ('I will preach the law'⁴) supported by a faith in the inevitability of Truth's and Righteousness's ultimate

¹ Matt. xii. 44; Luke xi. 25.

³ Ps. ii. 1.

² Ps. ii. 2.

⁴ Ps. ii. 7.

triumph ('Thou shalt bruise them with a rod of iron and break them in pieces like a potter's vessel'¹). Marx's Russian Khalifah's proclamation to the capitalists was an echo of Muhammad's legendary message to Heraclius and Khusrū Parwiz: 'Be wise now therefore, O ye Kings; be learned, ye that are judges of the Earth.'² . . . Kiss the Son lest He be angry, and so ye perish from the right way.'³ Russian Communism's simultaneous proclamation to the Proletariat was: 'Blessed are all they that put their trust in Him.'⁴

A third strong point, in the short run, in the Communist Russian approach was the replacement of a traditional Eastern Orthodox Christianity by a Marxian post-Christian Western ideology as the current expression of Russia's perennial orthodoxy; for the Marxian ideology was a heresy in orthodox post-Christian Western eyes, and the anathematization of Marxism by a Western dominant minority was a testimony to its truth and righteousness in the sight of a now world-wide Western proletariat in which the peasant majority of Mankind had been brigaded together with the Western industrial workers.

Marxism interpreted by Lenin and Stalin and preached from the Kremlin made, in this exotic Russian dress, a potent appeal to the World's peasantry from China to Peru and from Mexico to Tropical Africa; for Russia herself had been, till yesterday, one of these poor and powerless peasant countries. In her social and economic situation Russia had a much closer affinity than the United States had with the depressed three-quarters of the Human Race for whose allegiance the two Powers were competing; and Russia could claim, with a specious appearance of veracity, that she had saved herself by her exertions and the rest of the Proletariat by her example. The heretical Western ideology which the Russians had made their own had enabled them to increase one great peasant country's collective power, and in the same act to raise its inhabitants' personal standards of living,⁵ by acclimatizing a current Western technology through an industrial revolution—which, in Russia, had been made by the State in the Community's interest (as the Bolsheviks conceived of it) and not by private *entrepreneurs* in theirs. Soviet Communism's achievements, as presented in Soviet Communist propaganda, sounded impressive in the ears of non-Russian peasants and industrial workers who had no opportunity of checking the story that they were being told by the evidence of their own eyes; and even in the United States there were elements that might prove to be not altogether impervious to the Communist gospel.

In North America an oecumenical proletariat had been reproduced in miniature; for, in spite of tardy measures for the restriction of immigration from Europe and Africa and for the exclusion of immigration from a 'Barred Zone' of Asian countries,⁶ the peasantry of the Old

⁴ Ps. ii. 12.

⁵ See IX. viii. 684-9.

⁶ See T. Oynbee, A. J., and Boulter, V. M.: *Survey of International Affairs*, 1924 (London 1926, Milford), pp. 86-114 and 127-60. On the 27th June, 1952, when the writer was revising the present passage in his present work at Princeton, New Jersey, the McCarran-Walter Immigration Bill was enacted through being repassed by the Congress at Washington by more than the two-thirds majority of votes that was required in order to override President Truman's veto. This Act, which, on the whole, consolidated and

World was widely represented in the lower ranks of the American industrial working class; and the fusing power of 'the Melting Pot', in which America had put her trust as her solution for the problem of class-conflict, was counteracted by the institution of caste to the detriment of any American citizens of alien origin who differed markedly from their White fellow-citizens in physique. In a United States whose population was no longer being recruited by immigration in any appreciable volume, a Negro proletariat that was drifting away from Southern fields into Northern slums seemed destined to remain permanently battered down at the bottom of a social sump. The cutting off of the nineteenth-century stream of immigration was thus having the effect of generating, inside the Oceanic moats that were 'Fortress America's' natural frontiers, a penalized and alienated class in the American body social in which an enterprising director of Russian operations in a 'Cold War' might perhaps one day find the makings of a 'fifth column';¹ in this new American proletariat, in the technical sense of the term, the urban coloured population was merely the most conspicuous among a number of elements; and the middle class's sensitiveness to this potential danger in their midst was betrayed in their inclination to tolerate an odious practice of 'witch-hunting' that was a menace to traditional American civil liberties, and in their readiness to jump to the conclusion that any American citizen who had once been denounced by American 'witch-hunters' as an agent of Soviet Communism must be guilty even if proved innocent.

While this American nervousness was an index of the opportunities for Communist propaganda in an American mission-field, there were of course, weak points, as well as strong points, in the Russian Communist approach to a solution of Mankind's current social problems.

The most serious of these Russian weaknesses was the most obvious one. Soviet Communism had set out to put an end to the private exploitation of one individual human being by another, and, consistently with this aim, the fundamental law in the Soviet Communist social code was a veto on the private employment of labour; but the only practical means of liberating individual human beings from private exploitation by their fellows that Soviet Communism had been able to devise—or been willing to adopt—was the public exploitation of all individuals alike by the omnipotent rulers of a totalitarian state. The urban proletariat that a Western middle class had inadvertently called into existence in the course of their pursuit of their own private purposes had been manufactured deliberately in Russia by the Soviet Government for the sake of fulfilling the Marxian scriptures. A consequent weakness of Soviet Communist policy was that, in suppressing all individual liberty and thereby making sure of getting rid of the abuse

confirmed the already existing restrictive legislation, had at least the merit of abolishing, for the benefit of non-Communist Asian countries, the former invidious difference in status, for the purposes of the immigration law of the United States, between Asian countries on the one hand and European and African countries on the other.

¹ Professor McNeill comments: 'I believe it is true that, so far, Communism has made little progress among American Negroes; a better example would be the relative prominence of Jews in the ranks of the United States Communist Party.'

of private power to which the enjoyment of individual liberty might give rise, the Soviet Government had also cut the roots of an incentive to produce and to create which individual liberty alone could keep alive.

If the tasks of production and creation were ever to be taken wholly out of the hands of human beings and were to be assigned wholly to an impersonal 'Collective Man', the result could only be to bring production and creation to a standstill. The psychic driving-force of personal purposefulness and zest cannot be effectively replaced by the goads of governmental terrorism and coercion, and the rulers of the Soviet Union had tacitly confessed that they had learnt this lesson by experience when they had introduced their 'Stakhanovite' system of differential rewards for different degrees of efficiency in output, which was familiar in the West under the name of 'piece-work', and when they had sought to find an alternative to the monetary incentive for competition in honorary incentives of the kinds that had proved effective in Western monarchies under the *ancien régime* and subsequently in the recreational field of non-professional sport. Such concessions by Communism to Individualism may have tempered Communism's damping effects; yet these were no more than mitigations of a system that was intrinsically inimical to the application of human energies to economic purposes, and a non-Russian and non-Communist observer found it hard to see how, in the long run, on the economic and administrative (as distinct from the ideological) plane, a Communist totalitarian régime could avoid evoking an extreme manifestation of the defensive, negative, unenthusiastic trade-union and civil-service ethos. This prospect was a serious menace to the Soviet Union's chances of success in her competition with the United States, where even the trade-unionist industrial working class was infected with the American middle class's belief in the virtues of private enterprise and with its determination to keep this source of economic productivity and creativity alive.

The Soviet Union's present economic inferiority to the United States was as indisputable as it was depressing for believers in the Soviet Communist dispensation; and, though this inferiority was due, not merely to a difference of régime, but to the backwardness of Russian technology as appraised by Western standards, the Soviet Government had debarred themselves by the extravagance of their mendacity in their own domestic propaganda from making the valid and pertinent points that this technological backwardness of Russia's was at least as old as the seventeenth century and that, since the Bolsheviks' own advent to power in A.D. 1917, they had emulated the achievements of Peter the Great himself in notably diminishing the length of Russia's technological lag behind the contemporary progress of her Western neighbours.¹ Instead of claiming credit for their genuine and praiseworthy successes in narrowing the gap between Russia's and the West's technological and social performance, they had painted, for their subjects' edification, a fancy picture of an instantaneously attained Soviet Communist Earthly Paradise by comparison with which the contemporary Capitalist World was a howling wilderness. In consequence, the

¹ See IX. viii. 126-49.

Soviet Government were now living in constant fear of the possibility that their subjects might discover the very different truth; and the acuteness of their concern about this danger was betrayed by the rigour of their precautions for preventing personal intercourse between their subjects and the citizens of 'capitalist' countries.¹ Western psychological opportunities for propaganda in a Russian mission-field, if ever the iron curtain were to become rusty enough to be perforated, could be gauged by the degree of the Soviet Government's nervousness. The Soviet Government were taking individual lapses out of the Communist Faith in the Soviet Union just as hard as the American public were taking individual lapses into it in the United States.

The likeness between these contemporaneous American and Russian anxieties was significant because it was not fortuitous. The reason why both parties were taking so tragically any successes scored on their home front by their adversaries was that, in an *Oikoumenê* whose conductivity had been gaining in intensity in proportion to the progressive diminution of geographical distance measured in terms of human intercourse, it had now manifestly ceased to be feasible to attempt to create an Earthly Paradise in any artificially insulated province of what was already, on the psychic plane, One World. In the history of the Soviet Union the counterpart of an American Isolationism had been Stalin's slogan 'Socialism in One Country'; but, though this slogan had served Stalin's personal domestic purpose of defeating and ousting his rival Trotsky in a four-years-long struggle within the bosom of the Soviet Communist Party that had ended in Stalin's definitive victory in January 1928, it was no more fit than American Isolationism was to serve as a practical programme for a policy in the real world of the day; for in this world the Soviet Union and the United States were competing with one another at close quarters, and either party would be condemning itself to swift defeat and to eventual subjugation at its adversary's hands if it were ever to leave this adversary a free scope for sowing tares in the oecumenical mission-field² while it confined its own activities and attention to the cultivation of its own garden. The recent metamorphosis of the *Oikoumenê* through the magic of Western technology was forcing the Soviet Union and the United States to contend with one another in a world-wide arena.

The West European approach towards a solution of the problem of class-conflict, which was most in evidence in Great Britain and in the Scandinavian countries, differed from both the American and the Russian approach in being less doctrinaire than either of them. The British people, in particular, were now feeling their way towards a solution by compromise—an approach to political problems to which the British had become addicted as the result of a more-than-three-hundred-years-long apprenticeship in trial and error. In this span of their political history, intransigence had cost them the two catastrophes of the English Civil War and the secession of the Thirteen Colonies in North America, while the contrary tactics of compromise had enabled them to negotiate the gradual transformation of a unitary empire into a co-operative

¹ See pp. 534-5, above.

² Matt. xiii. 25.

commonwealth of nations and to carry out the domestic revolutions of A.D. 1688, 1832, and 1945 without either falling into civil disorders or sowing the seeds of inveterate resentment in the hearts of the class that happened to be the loser on each occasion. Since as early as the thirteenth century it had been one of the recognized principles of English statesmanship that it was the part of wisdom for the ruling element (*Graecè πολίτευμα*) in the body politic to forestall the danger of a *coup d'état* by voluntarily taking into partnership with itself any class, hitherto outside the privileged circle, which had accumulated sufficient power and experience to be now probably capable, in the last resort, of forcing an entry if it did not find an already open door. In A.D. 1945 the British middle class, which had profited by the agrarian landlords' acquiescence in its enfranchisement in A.D. 1832, had acquiesced in its turn in the industrial workers' advent to power; and this compromise between the politically conflicting interests of the middle class and the working class had been made feasible by a simultaneous compromise between the ideologically antithetical dispensations of Private Economic Enterprise and Socialism.

This institutional compromise was a common-sense recognition of the hard facts of the situation in which all West European peoples now found themselves. In countries that were in process of losing power and wealth to rising giants on the fringes of an expanding Western World¹ at the very time when the local industrial workers were demanding 'a new deal', it was manifestly impracticable for the West European middle class to follow the North American middle class's policy of offering to the working class the two amenities of a virtually middle-class standard of living and an abundance of individual opportunities for rising in the social scale as alternatives to governmental intervention for the promotion of social justice at the price of a regimentation that had proved to be unavoidable in any redistribution of private purchasing power through governmental action. On the other hand, in Great Britain, the Scandinavian countries, the Low Countries, and France civil liberties were so strongly entrenched and so highly prized by citizens of all classes that it would have been equally impracticable in any of these countries to carry governmental intervention on behalf of social justice to the Russian length of a régime of totalitarian autocracy. Accordingly the current Anglo-Scandinavian approach to the problem of class-conflict was an attempt to find a middle way between an American and a Russian extreme by experimenting in an illogical combination of a modicum of free private economic enterprise with a modicum of governmental planning and regimentation in the interests of social justice. In medical parlance this Anglo-Scandinavian Social Democracy might be described as a vaccine for giving immunity against the virus of Communism; and the efficacy of this West European preventive social medicine was certified by its irritating effect on Soviet Communist nerves. Next to the Trotskys and Titos whose deviationist Communism was a threat to a Stalinian orthodoxy within the Com-

¹ This dwarfing of Western Europe has been noticed in IV. iv. 308-13, and on p. 486, above.

munist fold, the Stalinists' principal bugbears were the Undéns and Attlees whose contemptible milk-and-water nostrum was breaking all the rules of a Marxian Historical Necessity by sterilizing the orthodox Communist Faith's mission-field in Western Europe.

This prosaic Anglo-Scandinavian policy of institutional compromise would ultimately be appraised on the practical test of its outcome in the long run, and in A.D. 1952 it would have been premature to try to anticipate History's future verdict on it; yet some, at any rate, of both its strong points and its weak points were by then already apparent.

Its strongest point was its consonance with the general experience of Man in Process of Civilization and with the particular requirements of the living generation of Mankind in an *Oikoumenê* in which a number of formerly segregated and diversified societies had been suddenly brought into close quarters with one another by advances in a Western technology that had been too swift to allow time for these now next-door neighbours to become culturally acclimatized to one another.

The policy of brewing a mixture between Socialism and Freedom of Private Economic Enterprise was justified by past experience, inasmuch as it would have been difficult for the best informed historian to cite significant examples of historical communities in which either of the two elements in this mid-twentieth-century British mixture had been wholly absent. Between the repellent anarchy of an abortive Scandinavian Civilization in Iceland and the uninviting regimentation of an Incaic Andean universal state, the constitutions of a vast majority of the communities that had risen and fallen up to date in societies in process of civilization had contained both an appreciable ingredient of Socialism and an appreciable ingredient of Personal Liberty. Communities that had allowed Individualism to run riot in private armies and private executions of private judgements founded on private laws had been as abnormal as communities that had allowed Socialism to go so far as to impose a community of wives and husbands or combs and toothbrushes; and, while, in the mixture between the two dispensations that was the normal constitution of Society, there had been an infinite variety in the quotas of the two ingredients, and a perpetual dissension over the perennial question of what these quotas should be in any particular ephemeral set of kaleidoscopically changing social circumstances, the same two ingredients had regularly been present in the constitutions of most communities in the common run. In the solid setting of this historical background, mid-twentieth-century British social policy looked as realistic as it was empirical; and, if this conformity with past experience was its outstanding justification, its outstanding merit was its relevancy to present needs.

The philosophical implication of the current British institutional compromise was that the issue between Socialism and Private Enterprise on the economic plane—as, for example, over the question whether the telegraph and telephone service should be operated by the public post office or by private enterprise—was not a question of ideological principle on which it would be wrong not to take an intransigent stand, but was a question of practical expediency on which it would be wrong

not to follow the pedestrian path of empiricism and give-and-take. This was a saving truth in a world which was faced with a genuine and crucial question of principle in the issue between a worship of God and a worship of Collective Human Power, and which had seen the power of Leviathan formidably reinforced by the onset of a soul-destroying Mechanized Technology. This was the battle in which the Spirit of Man must conquer or die in a twentieth-century oecumenical arena; and the living generation of Mankind had much to gain by adopting a British approach to current social problems that would leave human souls free to throw themselves into the momentous struggle on the religious plane without having their attention and energy diverted to fight on the economic plane over an issue of secondary importance.

The British approach was also sound common sense in a world in which peoples bringing with them sharply diverse cultural heritages had now been brought face to face with one another so suddenly by a technological 'annihilation of distance' that even the pace of the rapid and radical economic and social transformation which Technology was simultaneously bringing to pass throughout the *Oikoumenê* was not swift enough to give this jostling crowd of motley communities time to make mutual adjustments unless the period of grace could be prolonged by the exercise of Charity and Tolerance. Perhaps the two most promising features of the British approach were its flexibility and the coolness of its emotional temperature. In the British mixture between Socialism and Free Private Economic enterprise the proportions between the two ingredients could be agreed *ad hoc* in accordance with the particular requirements of a particular community at a particular time and place, and the proportions agreed today could be modified by a fresh agreement tomorrow in order to cater for changes overnight in methods of technique, in the size and distribution of national, sectional, and individual incomes, and in manners and customs. This flexibility of the British prescription for alleviating a social indisposition was unquestionably better adapted to provide for Mankind's still locally diverse and now everywhere rapidly changing current social needs than the rigid lines on the blue prints of rival Russian and American plans for social engineering, while the lowness of the temperature generated by a British social apothecary's work made it feasible to keep on perpetually experimenting in it without courting any serious risk of a catastrophic explosion.

When a British observer reached a conclusion that was so gratifying to British self-esteem, he had to ask himself whether—in spite of his not being an adherent of the Labour Party—he might nevertheless be a victim of a distorting national egocentric illusion; and, even if perchance his judgement were to be endorsed by non-British contemporary observers who could not be suspected of the same partiality, a disinterestedly favourable appreciation of the British approach might still be offset by a pessimistic estimate of the prospects of seeing a Twentieth-Century World take this salutary British middle course. The Anglo-Scandinavian experiment in Social Democracy was being made at a time when the margin of energy, wealth, and power required for embarking

on a great new social venture had been wiped out in Western Europe by the cumulative effects of two world wars fought mainly on European battlefields; and, even if Great Britain were to succeed in making an enduring practical success of Social Democracy at home, it might be doubted whether, in the second half of the twentieth century, her influence would still be great enough—as it might have been a hundred years earlier, when she had been at the zenith of her power and prestige—to move other countries to follow her in experimenting in *ad hoc* mixtures of Socialism with Free Private Economic Enterprise.

If the peaceful domestic revolution in Great Britain in and after A.D. 1945 and the peaceful departure of the British from India in A.D. 1947 should come to be reckoned, in the judgement of Posterity, among the finest of the examples that the British people had ever set, then the timing of these two historic British acts might come to be lamented as one of the ironies of History. There could never have been a greater need for such examples of the unflamboyant virtues of reasonableness, self-restraint, conciliatoriness, and far-sightedness; but the practical effect of a good example is determined, not by the degree of the need, but by the degree of the readiness to follow it; and on this practical criterion these two British examples had possibly been given a hundred years too late. Yet, whether a distracted Twentieth-Century World did or did not prove willing to follow a British lead, it would find itself unable to elude the problem with which British statesmanship was wrestling in the United Kingdom on the morrow of a Second World War. In this chapter of British, Western, and human history the British people were groping after a practical solution of a theoretically insoluble problem by which the Human Social Animal was perennially beset. If Freedom and Justice were intrinsically incompatible ideals, as they were, and if nevertheless *Homo Politicus* could not afford to renounce either of them, as he could not, how was Jehu to drive in double harness two equally indispensable steeds that were pulling their human driver's chariot in two opposite directions? Any practical solution of this problem would be unlikely to be anything more than a local and temporary makeshift; yet the problem itself was so importunate and so crucial that even a makeshift solution in a single chapter of parochial history might prove to be something of general and permanent value for Man in his perpetual struggle with his own Human Nature.

(IV) POSSIBLE COSTS OF SOCIAL JUSTICE

Since social life is impossible for Man without some measure of both Personal Liberty and Social Justice, Human Society is a house perpetually divided against itself, which will not stand¹ unless the thrusts of these two conflicting dynamic ideals are shrewdly directed to making them hold the house together instead of pulling it to pieces. The temptingly simpler expedient of relying solely on one of the two opposing forces and eliminating the other is impracticable, because it is impossible for the Human Social Animal to dispense with either ideal. Personal

¹ Matt. xii. 25.

Liberty is an indispensable condition for any human achievement, good or evil, since human action can be undertaken only by individual minds and wills. At the same time, Social Justice is the sovereign rule of the game of human intercourse, and this rule can never be broken with impunity for the sake of giving scope to Personal Liberty, even when in other respects the exercise of Personal Liberty is achieving results that are indisputably good. An uncurbed Personal Liberty generates oligarchy by giving a free hand to a minority who, in an unrestricted competition of all against all, are more than a match for the rest of the community in physical strength, mental ability, wealth, or political power. On the other hand, Social Justice cannot be enforced up to the hilt except by completely suppressing Personal Liberty and instituting an absolute dictatorship.

In the history of Man in Process of Civilization, all known social constitutions had been pitched somewhere between these two theoretical extremes, with a bias, more or less strongly pronounced, in the one direction or in the other. The Soviet Communist régime in Russia, for example, had been expending almost all its zeal and alertness on guarding against the abuse of Personal Liberty through the private exploitation of one person by another, without being comparably sensitive to the evils of the dictatorship through which it was vindicating the demands of Social Justice.¹ By contrast, the Constitution of the United States had provided effective safeguards against dictatorship by its elaborate mechanism of checks and balances, without having shown a comparable concern to prevent freedom of personal enterprise from degenerating into freedom for one person to exploit another for his private profit.

Considering that, at the time of writing, both the United States and the Soviet Union were going concerns, it could be inferred that, in practice, neither of these two antithetical polities had pushed its own characteristic bias to the point of disequilibrium at which the house would come tumbling down upon its inmates' heads. In the working constitutions of both the Soviet Union and the United States, as in those of all other polities known to History, elements of both Personal Liberty and Social Justice were combined in diverse ratios; and in a mid-twentieth-century Westernizing World the mixture, whatever it might be, was invariably labelled 'Democracy', because this disinterested Attic blessed word had come to be an obligatory shibboleth for every self-respecting political alchemist. In the Soviet Union in A.D. 1952 'Democracy' signified a substantial measure of Social Equality combined with a vestige of Personal Liberty that was the maximum compatible with the Communists' prescription for securing Social Justice. In the United States at the same date the same term 'Democracy' signified a substantial measure of Personal Liberty combined with as generous a modicum of Social Justice as an American indulgence of Personal Liberty allowed.

¹ Professor William McNeill points out that the Social Justice which, at this date, was being purchased in the Soviet Union at so high a price, in terms of a sacrifice of personal freedom, did not compare favourably with the Social Justice current at the time in the United Kingdom, or indeed in the United States, when the comparison was made in terms of the gamut of the differences in the personal incomes that different individuals in different occupational groups or classes were allowed to draw out of the total product of the community's collective work.

These diverse brews uniformly labelled 'Democracy' all had the elementary practical merit of making the wheels of a social mechanism revolve; yet the display of a reassuringly pretentious term of political art was a disingenuous device for concealing the cracks in the divers make-shifts over which the label bearing the bold imprint 'Democracy' had been pasted by rival bill-posting politicians. An intrinsic contradiction between Personal Liberty and Social Justice could not be reconciled at all by the mere repetition of a political catchword that was specious only because it was ambiguous, and it could not be reconciled more than superficially and provisionally by the more respectable and useful artifice of improvising makeshift political and economic measures for reconciling the two ideals in practice. The only genuine reconciliation between these conflicting ideals of Liberty and Equality was to be found in the mediating ideal of Fraternity;¹ and, if Man's social salvation depended on his prospects of translating this higher ideal into reality, he would find the politician's ingenuity a bruised reed,² since the achievement of Fraternity was beyond the reach of human beings so long as, in their struggles to achieve it, they trusted exclusively in their own powers. The Brotherhood of Man was an ideal that men could never translate into reality without acting on a saving belief in the common Fatherhood of God; and the implicit truth that human social problems could be solved only by lifting them from the social to the religious plane was as true in a twentieth-century Westernizing World as it had been true always and everywhere since the transfiguration of Sub-man into Man.

If in that world in that age Mankind's perennial social problem displayed any distinctive facet, this was to be found in the imperious intervention of a latter-day Western Technology; for, in the trembling balance in which Personal Liberty and Social Justice were being weighed against one another there and then, Technology's girder had been thrown, like Brennus's sword, into the anti-libertarian scale.

This finding could be illustrated and supported by taking an observation of a coming state of Society which was already within sight, though it might not yet be within reach. Let it be assumed, for the sake of the argument, that an almighty Technology has already accomplished the next major tasks on its agenda. By thrusting an atomic bomb into Man's hands Technology will have forced Man to abolish War and Civil Disorder and at the same time will have enabled Man to reduce the death-rate to an unprecedentedly low minimum by bestowing impartially on all classes in each community, and on all communities in the *Oikoumenê*, the benefits of preventive medicine. Let it further be assumed that these prodigious improvements in the conditions of Human Life by means of institutional changes have been carried out at a speed with which the

¹ The trio 'Liberty-Equality-Fraternity' had been deified by the authors of the French Revolution as a humanitarian substitute for a Christian theology's Holy Trinity. The incomprehensible persons of a hypothetical Godhead were to be replaced by three rational and practicable ideals. But this unacknowledged Christian inspiration of the ideas of 1789 was responsible for an *a priori* misreading of the true relation in which the three deified ideals stood to one another. In reality the trio was not a Nicene Trinity-in-Unity but was an Hegelian resolution of forces. Fraternity was the synthesis that could resolve a conflict between the thesis of Liberty and the counter-demands of an Equality that was Liberty's antithesis.

² 2 Kings xviii. 21.

consequently requisite cultural changes have failed to keep pace. These assumptions require us to imagine that the peasant three-quarters of Mankind will not yet have lost their immemorially old habit of reproducing their kind up to the limits of their means of subsistence; and this assumption in turn requires us to imagine them still to be expending on increases in their head of population all the additional means of subsistence that will have been placed in their hands by the establishment of a World Order that will have brought in its train the benefits of peace, police, hygiene, and the application of Science to the production of food.

Such prognostications would not be fantastic; they would merely be projections of current tendencies into the future. In China, for example, increases in the head of population had swallowed up increases in the means of subsistence which had been bestowed on the peasantry in China by the introduction of previously unknown food crops from the Americas in the sixteenth century of the Christian Era and by the establishment, in the seventeenth century, of a *Pax Manchuan*. Thanks to the naturalization of maize in China *circa* A.D. 1550, of sweet potatoes *circa* A.D. 1590, and of pea-nuts at the turn of the sixteenth and seventeenth centuries, the population had risen from the 63,599,541 indicated by the returns in the census of A.D. 1578 to an estimated figure of 108,300,000 in A.D. 1661—and this in spite of the fact that in the interval between these two dates this spurt in the growth of population had been partly offset by the mortality arising from Chinese civil disorders and Manchu military operations in the anarchic transition to the Manchu régime from the Ming.¹ Thereafter, under the Manchu Peace, the population had continued to rise to 143,411,559 in A.D. 1741 and to a figure of the order of 300 million by the time when, half-way through the nineteenth century, the decline of the Manchu régime in its turn had brought with it a fresh bout of anarchy that had taken another heavy toll of Chinese life. This prompt conversion of additional resources into additional population in China under the Ming and Manchu dispensations had been duplicated in a comparably portentous increase in the populations of India under a British Rāj and of Java under Dutch rule; and it was significant that all recent increases in Asian peasant populations were ultimately traceable to the oecumenical effects of Modern Western enterprise, since even in China, which had never come under the direct rule of any Western Power, the increase in the food-supply through the introduction of new crops had been a consequence of the West Europeans' discovery of the Americas.

If the effect of Modern Western enterprise in enabling Asian peoples to indulge their habit of increasing their populations up to the limit had been so great, yesterday and the day before, in the local and temporary incubators constituted by a Manchu, a Dutch, and a British Peace, it seemed safe to predict that the same effect of the same cause would be powerfully enhanced tomorrow if the whole *Oikoumené* were to be united politically under an American Peace and if, within this global Earthly Paradise, the beneficent medical applications of a still advancing Western

¹ See Goodrich, L. C.: *A Short History of the Chinese People* (London 1948, Allen & Unwin), pp. 198-9.

Science were to continue to reduce the World's death-rate, besides continuing to increase the World's production of food. Though Science's magic cornucopia had produced an abundance that had falsified Malthus's pessimistic expectations up to date, the insuperable finiteness of the area of the Earth's surface must set a ceiling to the progressive increase in Mankind's food-supply that even Science could not transcend; and the pace of the Intellect in making scientific discoveries, and of the Will in applying them, was so much swifter than the pace of the Sub-conscious Psyche in adjusting its habits to conform with the necessities of successive new situations, into which it was perpetually being hustled by its volatile yoke-fellow, that it seemed at least as likely as not that Science's ceiling of global food production would be reached some time before the Peasantry's habit of breeding up to the limit would have been overcome.

The British people had taken not much less than 140 years to adjust their breeding habits to a rise in the population of Great Britain produced by a fall in the death-rate that had begun *circa* A.D. 1740;¹ and this had been the rate of change of habits in a then already predominantly commercial-minded community in which 'the cake of custom'² had been much less massive, less opaque, and less resistant than it yet was in the twentieth century in any of the peasant communities. It was, no doubt, conceivable that the Peasantry's custom of breeding up to the limits of subsistence might yield some day to the solvent of an exotic Western technology; for a Peasantry who by A.D. 1952 were already discovering that this Western talisman could endow them with something like a Western military efficiency,³ at the price of their submitting to a Late Modern Western drill, might go on to discover that it could also endow them with something like a Western standard of living at the price of their adopting post-Modern Western methods of keeping the increase of population within bounds. Yet, even if there was thus some hope of the Peasantry's eventually making this revolutionary change of practice in this Malthusian field, the change here could hardly be counted upon to come quickly enough to forestall the onset of an already impending crisis.

In thus forecasting a posthumous fulfilment of Malthus's expectations, we should also have to forecast that, by the time at which the disconcerting gap between the World's food-supply and the Peasantry's breeding habits would have brought the Peasantry to the verge of famine, some oecumenical authority would have made itself responsible for looking after at least the elementary material needs of the whole living population of the planet. This prognostication, again, would be merely a projection of current tendencies, since, at the close of the Second World War, the quantities and kinds of the food required by the whole population of the World had actually been estimated, and the existing supplies been commandeered and allocated, to meet the minimum needs of the rice-eating, wheat-eating, and maize-eating provinces of the *Oikoumenê*,

¹ See pp. 386-7, above.

by the United Nations Relief and Rehabilitation Administration. Even if we assume that the minimum standard of living that a future oecumenical authority would have undertaken to secure for the population of the World would have been no higher than the minimum standard for the population of England that had been contemplated in Queen Elizabeth's 'Poor Law' statute of A.D. 1601, a situation in which any authority would have assumed any responsibility for guaranteeing the whole living generation of Mankind against starvation in a world in which the production of food would have reached its ceiling would be a situation in which the begetting of children would have ceased to be the private affair of wives and husbands and have become the public concern of a ubiquitous impersonal disciplinary power.

If this situation were one day to arise, it would impose on Mankind one of the most drastic revolutions in human history since the first essays in Civilization; for hitherto men and women had not only been at liberty to beget children at their own discretion but had enjoyed this freedom when they had been destitute of all other rights and assets. This historic freedom was attested, as we have noticed in an earlier context,¹ by the etymology of the word 'proletariat'; for that technical term in the vocabulary of a Modern Western sociology was derived from a Latin word coined for the statistical purposes of the Roman census to describe a category of Roman citizens 'who had nothing but their children to enter in their returns as their contribution to the common weal'.² This Roman administrative terminology was an eloquent testimony to the truth that, in the history of Man in Process of Civilization up to date, no government—not even the most meticulous and most inquisitorial tyranny—had ever thought of contesting its subjects' freedom to reproduce their kind.

The nearest that governments had come hitherto towards intruding on this inner sanctum of private life had been to institute negative or positive rewards for the parents of large families if the public authorities were anxious to obtain an increase in their supplies of man-power or cannon-fodder; but they had no more dreamed of forbidding their subjects to restrict the size of their families than they had dreamed of compelling them, instead of merely inducing them, to multiply. Indeed, the freedom to beget or not to beget had been hitherto so uncontroversially sacrosanct that it had been tacitly taken for granted; and even as late as A.D. 1941 it had not occurred to President Roosevelt to raise the number of the axiomatic human freedoms consecrated in his charter from four to five by explicitly putting on record a wife's and husband's sacred right to determine the size of their own families.³ It now looked as if the future might show that there had been an unintentional logic in Roosevelt's artless silence on this point, since it appeared that in the last resort—

¹ In I. i. 41, n. 3.

² 'Proletarii dicti sunt plebei qui nihil rei publicae exhibeant sed tantum prolem sufficient' (Nonius Marcellinus in his *Compendiosa Doctrina per Litteras*, quoted *ibid.*).

³ This right was not challenged in principle by the ban on the procurement of abortion, or even by the ban on the advertisement and sale of artificial contraceptives, that was the law of the land in many countries at the time of writing; for, in theory at least, these bans still left husbands and wives free to limit the size of their families by the exercise of sexual self-control.

given the World's ultimate ceiling of food production and the Peasantry's traditional breeding habits—a novel 'freedom from want' could not be guaranteed to Mankind unless a familiar 'freedom to beget' were taken away from them. On this showing, the maintenance of a minimum oecumenical material standard of living would require a public interference with Personal Liberty that hitherto was unheard of; for, though it was true that in the past a minute fraction of Mankind had been either forcibly precluded from exercising its right of reproduction or had voluntarily abstained from exercising it, religious celibacy had always been considered to be an exceptional act of spiritual heroism, while the practice of making eunuchs had ranked with Human sacrifice, Prostitution, Slavery, and War as one of the blots on the pages of the history of Civilization.

If the time were indeed to come when the begetting of children would have to be regulated in conformity with imperious requirements of public policy instead of being left to chance in being left to the personal discretion of wives and husbands, how was this revolutionary future extension of the powers of authoritarian government into the intimacies of private life likely to be received on the one hand by the peasant majority of Mankind and on the other hand by a minority whom an Industrial Technology had emancipated from the peasant's bondage to unquestioned custom? The controversy between these two sections of Mankind that the Malthusian issue was bound to evoke was likely to be acute and acrimonious, since either section would have grievances against the other which would seem clamant in the aggrieved party's estimation. The peasantry would feel aggrieved at being threatened with the loss of their traditional freedom to reproduce their kind on the plea that this was the only alternative to starvation; for this sacrifice would be demanded of them at a time when the gulf between their own pauper standard of living and the industrial peoples' relatively lavish standard would have come to be greater than it had ever been before.

A progressive widening of this gulf was, in truth, one of the consequences that must be expected to follow from the course of events that we have been anticipating, if we are right in forecasting that, at the time when global food production would be reaching its ceiling, the peasantry would still be expending most of its additional supply of food on adding to the head of its population, and the industrialized peoples be expending most of their additional supply of commodities on raising a slowly increasing or even stationary population's standard of living. Considering that, by the time of writing, most of the industrialized peoples had already either reached or come within sight of reaching a new equilibrium in the movement of their population through the offsetting of an antecedent decrease in the death-rate by an eventual countervailing decrease in the birth-rate, it seemed likely that, among these peoples, this tendency would continue;¹ and, considering further that their standard of living had risen notably even during the period when their populations

¹ Professor William McNeill comments: 'The stabilization of population in the industrialized countries is surely less certain now, since the Second World War, than this passage implies.'

had been increasing very rapidly in consequence of a decrease in the death-rate which at that time had not yet been offset by a countervailing diminution in the number of births, it seemed likely that these peoples' standard of living would rise still more steeply after their populations' net rate of growth had fallen off (assuming that this new lower rate would be, and would continue to be, not far from the economic optimum in the sense of being the rate that in the current social and technological circumstances would best work together with the contemporary local rate of increase in production to achieve the maximum of material prosperity).

In this situation in an *Oikoumenê* that would have been unified on the psychological and moral planes while on the economic plane the local contrasts between diverse standards of living would have been accentuated, the Peasantry would not see why, before they themselves were called upon to renounce what, for them, was the most sacred and precious of all human rights, an affluent minority of Mankind should not be called upon to part with a larger quota of their provocative superfluity in order to save an indigent majority from the stark choice between birth-control and starvation; and this demand, which the Peasantry would present with all the vehemence of a simple-minded good faith, would strike the relatively comfortable and sophisticated Western minority as being even more outrageously unreasonable than it was outrageously unjust.

What effrontery to demand that a Western élite which owed its enviable prosperity to its own ability, exertions, foresight, and self-control should be penalized in order to pay for the inevitable nemesis of the Peasantry's improvident incontinence! And what naïveté to imagine that, even if the Western peoples could be cajoled or coerced into allowing their own standard of living—'the system of arts and laws and manners which so advantageously' distinguished them 'above the rest of Mankind'¹—to be reduced to the starveling level on which the Peasantry had elected to remain, this sacrifice would extricate the Peasantry from a plight for which they had only themselves to blame! A distribution of the Western peoples' margin of material resources among the wilfully indigent mass of Mankind would obtain for the Peasantry no more, at the most, than a momentary postponement of an inevitable crisis, and it would produce this futile result, not merely at the cost of depriving the Western peoples of the fair reward for arduous good conduct, but also at the cost of depriving Mankind at large, including the peasant majority, of the possibilities of 'general happiness'² with which (so a Western mind was apt to assume) the Western way of life, and this way alone, was pregnant. If the peasants' way were to be allowed to prevail to the Western peoples' undoing, this would in fact be a holocaust of the rational hopes of Mankind on the altar of sentimentality. Surely this was a case in which an enlightened altruism demanded of the Western peoples that they should have the moral courage to insist on following the dictates of an enlightened self-interest!

If and when this controversy broke out, it seemed likely to be carried

¹ Gibbon, E.: 'General Observations on the Fall of the Roman Empire in the West', in *The History of the Decline and Fall of the Roman Empire*, at the end of chap. xxxviii.

² Gibbon, *ibid.*

from the planes of Economics and Politics on to the plane of Religion and this on several accounts. In the first place the Peasantry's current obstinate persistence in continuing to breed up to the limits of its food-supply was the social effect of a religious cause which could not be modified without a change in the Peasantry's religious attitude and outlook. The religious sanction that was now making the Peasantry's breeding habits so resistant to the arguments of a Western rationalism might not have been irrational in its origin, if we may hazard the conjecture that it had originated in a primitive state of society in which a household had been the optimum social and economic unit of agricultural production, and in which the perpetuation of each family had therefore been the key to keeping this Primitive Society in being. The epiphany of a latter-day Western industrial civilization was the new factor in Mankind's situation that had cut the rational roots of the Peasantry's by now traditional cult of *lares et penates*; for a Mechanized Technology had done away with the social and economic environment in which a worship of family continuity had made social and economic sense.

The persistence of the cult when there was no sense left in it was a consequence of the relative slowness of the Psyche's fastest pace on the subconscious level by comparison with the pace of the Intellect and Will, and it was to be apprehended that the Peasantry might cling to its ancestral deification of family continuity, at the ever more imminent risk of driving Humanity's ship on to Malthus's well and truly charted rock, unless and until the Peasantry's religion could be reoriented from an agrarian to an industrial *qiblah*. Now that the Industrial Revolution, through its 'annihilation of distance', had made one single family out of the whole of Mankind, the welfare and survival of the Human Race, instead of just the welfare and continuity of one household without regard for the rest of Mankind, had become the proper social objective of the religious commandment 'that he who loveth God love his brother also';¹ for a latter-day metamorphosis of the *Oikoumené* through the progress of Technology had vindicated the truth of Saint Paul's proclamation to the Athenians that God had 'made of one blood all nations of men for to dwell on all the face of the Earth, and' had 'determined the times before appointed';² and the advent of this long-since heralded oecumenical dispensation would call for a spiritual revolution as radical as the forgotten spiritual revolution that must have accompanied the creation of neolithic husbandmen out of palaeolithic hunters, fishermen, and food-gatherers.

Without this fresh religious revolution in the souls of the Peasantry, it was hard to see how the World's otherwise inexorable Malthusian problem was to be solved; but the Peasantry was not the only party to the situation that would have to achieve a change of heart if Mankind was to find a happy issue out of an impending affliction; for, if it was true—as experience had shown it to be true—that Man doth not live by bread only,³ then a self-complacently prosperous Western minority of Man-

¹ 1 John iv. 21.

² Acts xvii. 26.

³ Deut. viii. 3, quoted in Matt. iv. 4 and in Luke iv. 4.

kind still had something to learn, on its side, from the unworldly vein¹ in the *êthos* of a Peasantry which, in preference to hoarding the bread that it wrung from the ground in sorrow and in the sweat of its face,² had shared this hard-earned nutriment with an ever-increasing progeny in childlike obedience to Elohim's commandment to be fruitful and multiply and replenish the Earth and subdue it.³ This traditional religious duty, which had been laid upon the peasantry at the moment when they were reclaiming their first tiny fields from an apparently boundless wilderness, might become a bane instead of a blessing for Mankind in an age that had seen the *Oikoumenê's* last reserves of cultivable land brought under the plough in the Americas, Australia, Qāzāqstan, and Manchuria; but, inasmuch as this was also the age that had witnessed the rise of an acquisitive Western industrial civilization, it was no time for despising and rejecting the Peasantry's traditional virtue of subordinating the quest for material well-being to the pursuit of a non-material objective; for, in making nonsense of the Peasantry's ancestral worship of the Family, the Industrial Revolution had not discredited the abiding truth that Man is not merely a consumer but is also a soul, and that the Soul lives 'by every word that proceedeth out of the mouth of God'.⁴ 'For what is a man profited if he shall gain the whole World and lose his own soul? Or what shall a man give in exchange for his soul?'⁵

A latter-day Western Man had brought himself into danger of losing his soul through his concentration on a sensationally successful endeavour to increase his production of material commodities; and it was ironical that the society which had put itself in this spiritual jeopardy should have been one which, by comparison with a contemporary peasantry in Asia, Africa, and Indian America, had already been in enjoyment of a lavish standard of living at the time when it had embarked on its eighteenth-century agricultural and industrial revolutions. The insatiability of the Westerners' acquisitiveness laid them open to a Western philosopher's indictment.

'The Indian scale of values has never been at all like ours. On the whole it is true to say that in India the love of God has always been put above the love of material things. India is a civilisation based on Religion, while ours is a civilisation based on wealth.'⁶

If an industrialized Western Society was to find salvation in spite of itself, it would find it in virtue of having all the time unconsciously been

¹ This unworldly vein was, of course, only one element in the *êthos* of a Peasantry that was saddled with as heavy a load of Original Sin as a contemporary Industrial Proletariat with whom it had in common a uniform Human Nature. The peasant *êthos*, like the urban *êthos*, had its selfish, exploitative, and materialistic side; and there were peasantries—for example, in the Flemish and French provinces of a Western World—in whose spiritual 'make-up' these unattractive characteristics were not perceptibly mitigated by the touch of archaic piety with which they were still apt to be combined in the character of the peasantries in the non-Western societies. A sentimentally idealized portrait of a non-Western peasantry, when painted with a Western brush, might be suspect of being a subjective expression of the painter's dissatisfaction with the shortcomings of his own society rather than an objective reproduction of the observed lineaments of the picture's professed subject.

working not solely for its own material profit, but also for the benefit of a majority of its fellow men who were still living at the Peasantry's starveling level. Industrialism was a Western gift to Mankind at large which might be not the less beneficent for having been unintended; and the best hope for Mankind lay in a spiritually fruitful marriage of the Western engineer's insight with the Asian husbandman's. The peasant had to learn from the engineer that, in Human Life on Earth, a minimum of economic well-being was the necessary material condition (*Graecè χορηγία*) for spiritual achievement, while the engineer had to learn—or re-learn—from the peasant that the enterprise of increasing Man's command over Non-Human Nature had no value except as a means towards some end beyond itself, even if the particular end that had been the Peasantry's traditional objective were now an anachronism in the new world that the engineer had conjured into existence.

If these were the new religious issues that a future oecumenical Malthusian crisis might be expected to raise, it was also to be foreseen that this crisis would present a challenge to the old religious establishments, since the Peasantry's primitive worship of family continuity was part of the flotsam which the higher religions had picked up and swept along in their flood waters when they had come down upon Mankind in spate.¹ Even a Buddhism whose original, authentic, and essential mission had been to reveal to suffering human beings a way of escape from the sorrowful wheel of sensuous existence had not succeeded in keeping clear of an older cult of procreation which was its antithesis; and, if Siddhārtha Gautama's philosophy had thus been constrained to come to terms with the husbandman's religion, it was not surprising that Confucianism, Christianity, and Hinduism should have been captivated by it.

In these divers higher religions and philosophies the influence of the cult of procreation could be detected in different degrees. In the Roman Catholic variety of Western Christianity this influence had not penetrated so deep as to impose upon the ecclesiastical subjects of the Catholic Church the positive pre-Christian commandment to be fruitful and multiply; the influence of the primitive cult on the current Catholic Christian code of morals could be detected only in a ban upon artificial methods of birth-control that had been invented in the Western World in the twentieth century of the Christian Era; and a prohibition that could be criticized as an irrational concession to Conservatism could also be defended on its merits as a courageous stand against a morally undesirable sexual practice. But the pertinent fact for the purposes of an inquiry into the prospects of the Western Civilization was that, in all the higher religions alike, the cult of procreation had won a footing that was sufficiently strong to threaten—or promise—to bring a revolutionary public policy into collision with established religious traditions if the time were to come when the pressure of the World's population upon the World's food supply would compel an oecumenical public authority to grapple with the formidable task of trying to regulate the movement of the World's population.

In this not improbable event, what would the old religious estab-

¹ See VII. vii. 455.

ishments' reactions be? The still older cult of procreation that had ensconced itself among the higher religions' traditions would presumably impel the ecclesiastical authorities of the day to champion the peasant's cherished freedom to reproduce his kind; but how would they apply their traditional teaching in an unprecedented situation? In a world whose population would be pressing upon its food supply because this world would have been liberated at long last from the inveterate evils of War, Pestilence, and Famine,¹ the churches would assuredly recoil from even considering the diabolical proposal that, in order to make room in a teeming world for the Peasantry to go on breeding without restriction, one and all of those three dire scourges should be let loose again upon Mankind. The nemesis for opening Aeolus's windbag that had overtaken Odysseus' insubordinate crew had been grievous even when the fatal act had been committed in the heat of passion by mutineers who had been blind to the consequences of what they were doing.² To sow the storm in cold blood, with the deliberate intention of reaping the whirlwind, would be a crime that no responsible ecclesiastical authorities would be likely to contemplate.

It seemed even more unlikely that the churches would countenance any proposal to regulate the movement of population by resorting on the grand scale to the infamous neo-pagan 'scientific' method—once practised by German National Socialists—of forcibly sterilizing, as a matter of routine, all persons who happened to be so unfortunate as to fall within categories condemned by the fiat of the public authorities; and, if these two fantastically wicked alternatives may be left out of consideration in any sober forecast of the churches' future policy on this formidable question, we must imagine the issue being narrowed down, in ecclesiastical counsels, to a choice between divers voluntary means of controlling the number of births. Could the sexual continence that had hitherto been the rare achievement of religious celibates be required of *l'homme moyen sensuel* in the marital state? And, if this degree of self-discipline could not be expected of Human Nature in a non-monastic social and spiritual environment, what was to be Religion's ultimate attitude towards artificial methods of voluntary birth-control? Was it to continue to set its face against them? And, if it did still hold to the churches' twentieth-century view, was it to regard this as a precept which the individual soul ought to be free to follow or reject according to the dictates of its own conscience? Or were the churches to try to enlist the support of a coercive secular arm by calling upon the public authorities to keep on the statute book the legislation that had made the advertisement and sale of artificial contraceptives illegal?

At the time of writing, when this issue had not yet come to a head in a society that was then still heavily engaged in wrestling with the rampant social evils of Class-Conflict and War, it was not yet possible to anticipate the decisions that a still unborn generation would be likely to take in a situation that at the time of writing was still merely hypothetical. It was, however, already possible to foresee that the debate, whatever its outcome, would be conducted on the religious plane, since it was evi-

¹ See 2 Sam. xxiv. 13.

² *Odyssey*, Book X, ll. 20-79.

dent that this issue raised the religious question of the ultimate significance and purpose of Human Life on Earth.

(V) PROBABLE EMPLOYMENTS IN A FUTURE OECUMENICAL SOCIETY

(a) 'A COMMONWEALTH OF SWINE'

If we could imagine a future Oecumenical Society in which Mankind had first rid itself of Civilization's congenital maladies, War and Class-Conflict, and had then followed up this success by going on to solve a Malthusian problem which the establishment of a world order would have brought to a head, we might surmise that Mankind's next problem after that would be the future role of Leisure in a mechanized society's life.

Leisure had already played a part of capital importance in human history; for, if Necessity had been the mother of Civilization, Leisure had been its nurse. One of the distinctive features of Civilization had been the astonishing rapidity of the pace at which this parvenu way of life had developed its potentialities during the five or six thousand years of its currency up to date by comparison with the tortoise-like tempo of the primitive way of life which Mankind had been following for hundreds of thousands of years before the earliest civilizations had made their epiphany; and this unprecedented impetus had been imparted to the civilizations by an able, purposeful, and virtuous minority of a privileged minority whose privilege had been the enjoyment of leisure. All the unique achievements of men and women in the realm of Art and all the cumulative achievements of Man in the realm of Science and Technology had been fruits of the profitably employed leisure of this creative minority within a minority; but in a post-industrial Westernizing World it could no longer be taken for granted that the growth of Civilization would continue to be fostered by the employment of leisure for these creative purposes; for the Industrial Revolution had upset—and this in several different ways—the previous equilibrium between Leisure and Life.

The first and most momentous of these changes had been a psychological one. The mechanization of work in an industrialized society had set up in the industrial worker's psyche a tension between his feelings towards his work and his feelings towards his leisure to which neither the peasant majority nor the privileged minority of the body social had been subject in a pre-industrial age in which Man's rations of work and leisure had not been dictated to Man by Man but had been given to Man by Non-Human Nature.¹ In an agrarian society a cycle of the seasons that had been the husbandman's calendar had consequently also settled for a leisured minority the allocation of their time between holding court and going on the war-path or between sitting in parliament and going shooting, fishing, and hunting; and the Peasantry and their rulers alike had taken both Work and Leisure for granted as inevitably

¹ See p. 565, above.

alternating phases in a Yin-and-Yang rhythm beaten out by the perpetually recurring astronomical cycles of Day-and-Night and the Seasons. Each experience of either phase was both a relief from the last bout, and at the same time a prelude to the next bout, of an alternate phase that was psychologically complementary rather than antithetical to the phase that happened at the moment to be in course. But this pre-industrial interdependence and consequent parity between the psychological values of Work and Leisure had been deranged when the worker had been transformed from a husbandman whose time-table was set for him by Nature into a tender of machines with power-driven wheels that could go on turning in season and out of season; for the chronic industrial warfare which the worker had now found himself compelled to wage in order to prevent his new masters the machines from working him to death had instilled into him, as we have seen,¹ a negative, defensive, hostile feeling towards a toil that his peasant forebears had taken as a matter of course; and this new attitude towards Work had brought with it a new attitude towards Leisure; for, if Work was intrinsically evil, then Leisure must have an absolute value in itself.

Human Nature's reaction against the routine of the factory and the office had indeed gone so far as to make the value of freedom from an excessive pressure of work count for more than the value of the remuneration that the manual or clerical worker could earn by working at full stretch; and this order of preferences, which in A.D. 1949 had been the conscious motive of the Wall Street typists' refusal to come to work on Saturdays,² had been implicit from the outset in the restrictive practices that Trade Unionism had worked out for itself; for these were methods of purchasing relief from the pressure of work by the sacrifice of potential earnings. This rating of leisure—at least in the negative form of an exemption from an excessive pressure of mechanized work—at a higher value than money-making was a preference which, in the first chapter of post-industrial Western history, had been a distinguishing mark of the industrial and clerical workers and a prime cause of dispute between them and their employers; and this attitude had begun to communicate itself from the working class to a hitherto pre-industrial-minded middle class in a subsequent chapter in which the working class's more and more effectively insistent demand for social justice was being met by a more and more drastic redistribution of purchasing power through the differentially graded taxation of middle-class incomes. By the sixth decade of the twentieth century of the Christian Era the Western middle class had begun to follow the working class's example by opting for leisure in preference to profits at a level of income—and this level was progressively being lowered—at which the greater part of any additional earnings would be taken from the nominal recipient by the tax-collector.

At the same time the so far unchecked advance of Technology at a constantly accelerating pace was playing a sardonic practical joke on its human victims; for, while the ceaseless turning of the never tiring wheels was threatening to work them to death, it was simultaneously

¹ On pp. 563-9, above.

² See p. 570, above.

threatening, in consequence, to throw them into technological unemployment, without ever allowing them to make up their minds which of these two contradictory scourges of Industrialism was the greater menace to human welfare and happiness. The industrial workers had no sooner reacted against the pressure of mechanization by insisting upon their right to leisure than their inhuman tyrant and tormentor Technology began to drive them into insisting upon their right to work by taking them at their word and forcing leisure upon them; and, although the trade-union practices that had been devised for putting a brake upon the killing 'drive' of mechanized industrial work also served the workers' further purpose of spinning out the residue of the employment that was now being snatched out of human hands by progressive improvements in the machinery that these hands were tending, this rear-guard action of Trade Unionism in a fight to make an inexorably dwindling amount of work still go round was manifestly a losing battle.

Technology and Trade Unionism, between them, were thus generating an abundance of Leisure that was unprecedented; and the manifest irresistibility of this tendency was making it possible to cast the occupational horoscope of a future Oecumenical Society that would have rid itself of War and Class-Conflict and have found some acceptable way of regulating the movement of population. In this Earthly Paradise Regained, a régime of full employment would also be a régime in which the ration of work that could be doled out to each individual would occupy so small a fraction of his day that he would have almost as much leisure on his hands as if he had been a member of the privileged minority in some antediluvian agrarian society. In such circumstances the use made of Leisure would evidently be even more important than it had been in a pre-industrial chapter of human history in which *Homo Faber* had still been such a tiro in his Technology that the number of man-hours which he had yet been able to liberate for Leisure had been minute by comparison with the number that he had still been compelled to devote to Work.

If there was a prospect of such revolutionary changes as these in the amount of the leisure acquired by, or thrust upon, Man, as well as in Man's attitude toward Leisure in its relation to Work, what effects on Human Life might this revolution be expected to have?

In an industrialized Western Society in which an excessive acquisitiveness had been the besetting sin of its middle-class moving spirits, there was one negative effect that was manifestly good in itself as far as it went. By the time when the middle class, as well as the working class, had begun to value Leisure more highly than earnings, it was beginning to look as if the mechanism of the Industrial System of economic production included a providential automatic brake that might perhaps avail to save *Homo Faber Mechanicus* from his demonic self. In making the Industrial Revolution, Western Man's acquisitive-mindedness had perhaps unintentionally been working out a cure for itself by first making work odious and then making this now already odious work also unremunerative. If a shark-like Western appetite for acquisition was thus having its edge taken off by the pressure and the insipidity of routine-

work in a mechanized society and by the ruthless efficiency of the tax-collector in a welfare state in reaping where he had not sown and gathering where he had not strawed,¹ this was surely a blessing in disguise for a *Homo Occidentalis* whose characteristic temptation had been to sell his soul if that was the market price of worldly prosperity. A society in which a minority had been allowed and encouraged to enrich themselves without restriction was surely a less estimable society than one in which a more equitable distribution of wealth was being secured at a cost of restricting the opportunities for enrichment and perhaps thereby diminishing, through the diminution of incentives to earn, the aggregate amount of the wealth that was now being less inequitably distributed.²

So far, so good; yet a mid-twentieth-century observer could not hail the reluctant transfer of psychic energy from money-making to the enjoyment of leisure as an unquestionable blessing, even for a Western Man whose nineteenth-century god had been Mammon, without taking into account the use to which the frustrated Mammon-worshipper was going to put the leisure for which he was now opting in preference to making money for the tax-collector to redistribute. This question had been raised in a notable address delivered, some twenty years before the time of going to press, by a philosophic spokesman of those magician-engineers whose cornucopia had 'been shaken over all the Earth, scattering everywhere an endowment of previously unpossessed and unimagined capacities and powers'.³ Speaking at York on the 31st August, 1932, to the British Association for the Advancement of Science, their president, Sir Alfred Ewing, had ended on the following note:

'We must admit that there is a sinister side even to the peaceful activities of those who in good faith and with the best intentions make it their business to adapt the resources of Nature to the use and convenience of Man. Where shall we look for a remedy? I cannot tell. Some may envisage a distant utopia in which there will be perfect adjustment of labour and the fruits of labour, a fair spreading of employment and of wages and of all the commodities that machines produce. Even so the question will remain. How is Man to spend the leisure he has won by handing over nearly all his burden to an untiring mechanical slave? Dare he hope for such spiritual betterment as will qualify him to use it well? God grant [that] he may strive for that and attain it. It is only by seeking [that] he will find. I cannot think that Man is destined to atrophy and cease through cultivating what, after all, is one of his most God-like faculties—the creative ingenuity of the engineer.'

The pertinence of Sir Alfred Ewing's question about Mankind's spiritual prospects in a world that was being mechanized by a Western technique was brought home to a student of the Hellenic Classics by the reminiscence of a passage in a treatise on *Sublimity in Style* which had been written during the reprieve that a disintegrating Hellenic Society had won for itself through an Augustan rally of its retreating forces.⁴

¹ Matt. xxv. 24 and 26; Luke xix. 21-22.

² This point is made by W. T. Stace in *What are our Values?* (Lincoln, Nebraska 1950, University of Nebraska Press), p. 58.

³ Quoted already in III. iii. 211.

⁴ Down to the time of writing, Western scholars had been unable to determine whether this work had been written in the third century of the Christian Era or in the first.

The Hellenic Civilization had been distinguished by its relative indifference to a quest for economic gain that had become the master passion of the Western Civilization in the first chapter of its Industrial Age; and therefore, if, even in the Hellenic World, an observer living in an age of social recovery had been struck and distressed by the spectacle of the spiritual impoverishment of his generation through their passion for material enrichment, the same distressing effect might be expected, *a fortiori*, to follow from the working of the same sinister cause in a demonically acquisitive post-Modern Western Society.

In the last extant chapter of *Sublimity in Style* the author professes to be reporting a recent conversation between himself and a philosopher in which they had been disputing about the causes to which this contemporary spiritual decadence was to be ascribed. The philosopher argues, like Tacitus in his *Dialogus de Oratoribus*,¹ that the literary decadence in which this spiritual decadence is reflected can be adequately explained as being a consequence of the loss of political liberty; but this political explanation is rejected by the author, who sees in it merely an example of Human Nature's notorious proneness to seek an alibi for itself by blaming external circumstances. In his alternative explanation of the spiritual decadence of his day the author puts his finger on the demoralizing effect of an oecumenical peace. World Peace demoralizes its beneficiaries by releasing their energies for expenditure on 'total war' (*ἀπεριόριστος πόλεμος*) in the non-military fields of money-making and pleasure-seeking, and, in the author's view, as he expounds it, these are the spiritual maladies that have reduced this generation's spiritual stature. He raises the question whether the loss of political liberty may not be a blessing in disguise for a generation that has sunk to so low a spiritual level; for, if characters like these were given a free hand, an Ishmaelitish acquisitiveness would bring down a deluge of evils upon the *Oikoumenē*.

'One of the cancers (*δαπανῶν*) of the spiritual life in souls born into the present generation is the low spiritual tension (*ράθυμιαν*) in which all but a few chosen spirits among us pass their days. In our work and in our recreation alike our only objective is popularity and enjoyment. We feel no concern to win the true spiritual treasure that is to be found in putting one's heart into what one is doing and in winning a recognition that is truly worth having.'

These findings of an Hellenic literary critic at some date during the first spell of a Roman Peace were endorsed, at the dawn of the Modern Age of Western history, by one of the foremost pioneers of a distinctively Western scientific spirit. The following passage is to be found in *The Advancement of Learning*,² which was published by Francis Bacon in A.D. 1605.

'... For as it has been well observed, that the arts which flourish in times while virtue is in growth, are military; and while virtue is in state, are liberal; and while virtue is in declination, are voluptuary: so I doubt that this age of the World is somewhat upon the descent of the wheel. With

¹ Cited in V. vi. 80-81.

² Book II, chap. x, § 13.

arts voluptuary I couple practices jocular; for the deceiving of the senses is one of the pleasures of the senses.¹

If the writer of these prescient words could have revisited the Western World three and a half centuries after the date at which he had written them, he might have been surprised to observe how accurately he had gauged the trend of the spiritual curve in which Western souls had begun to descend from Heroism towards Frivolity. Mid-way through the twentieth century of the Christian Era it was notorious—and significant—that the United States, where the Western industrial working class had come nearer than it had come in any European country towards being assimilated to the middle class in its material standard of living and in its opportunities for material advancement, was also the Western country in which, on the cultural, in contrast to the economic, plane, the middle class, for its part, had gone farthest down the *descensus Averni* which Bacon had foreboded. Yet the same middle class was slipping down the same steep place¹ in other Western countries likewise; and unwarily envious West European spectators of the use to which 'the common man' in the United States was putting his relatively ample margin of wealth and leisure at this date were apt to betray their own hankering after the frivolity that they were professedly castigating in an American whipping-boy when they maliciously described the American scene as a fun-fair patronized by grown-up children whose main interest in life was to play with mechanical toys. This caricature was perhaps not inaccurate as far as it went; for joy-riding could not be more felicitously described than as a 'practice jocular', nor television more felicitously than as an 'art voluptuary' designed to please the senses by deceiving them.² Yet any contemporary American critic of American *mores* could silence the carping West European visitor with a crushing 'De te fabula narratur',³ for the reality that was being caricatured in some of the

¹ Matt. viii. 32; Mark v. 13; Luke viii. 33.

² On the evening of the day on which he had written this sentence in the morning, the writer received a timely intimation that this might not be the last word that would have to be said about the cultural effects of the wholesale installation of television in the United States. That same evening he heard a shrewd American observer of the American political scene tell an English audience that, if they wished to understand the current movement of American feeling on international affairs, they must not ignore the effect of the rapid current spread of the network of an American television service. Television, he explained, had now made it possible for the American public to see the countenances and gestures, as well as to hear the voices, of the delegates to the Council and the Assembly of the United Nations Organization at Lake Success; every owner of a television set who tuned in to the sessions of these international bodies received a vivid impression of the contrast in manners, and in the inner ethos that these outward manners betrayed, between the Russian delegates and their Western colleagues; and this impression was making a potent effect on American public opinion because the proceedings at Lake Success had effectively caught and held the interest of American 'viewers'. When a meeting at Lake Success came on, 'viewers' would tune in to it, even if this meant their having to break away from looking at a classic boxing-match or at a popular vaudeville.

This piece of information neatly illustrated two points that had to be taken into account in any attempt to gauge the Western Civilization's prospects. In the first place it showed that Television was beginning to play its part in a political unification of the *Oikoumenê* through a 'medium of distance' that has been noticed in XII. D (ii) (b), above. In the second place it showed that a new instrument, which in the first flush of its novelty had been treated as a toy, might quickly be turned to account for serving a more serious purpose.

³ Horace: *Satires*, Book I, Satire 1, ll. 69-70.

extravagances of American life was a contemporary Western *Weltanschauung* that was shared with North America by Western Europe. The United States at this time was, in fact, performing the salutary service of an automatic confessional for the Western World at large. She was serving as a convex mirror in which any Western observer, from either side of the Atlantic, could become acquainted with some of his own spiritual deformities by beholding them here revealingly magnified.

It was, in truth, no mere accidental coincidence that the current symptoms of cultural proletarianization in the life of a Western middle class in the United States should have been contemporaneous with the raising, in the same country, of a Western industrial working class's material standard of life to what was virtually a middle-class level. One of the elements in a higher material standard of living was, as we have seen, a larger ration of leisure. This increase of leisure was simultaneously being bestowed upon the industrial working class in Western Europe as one consequence of a radical revision of rates of wages and hours of work; and it was only to be expected that the progress towards social justice that was thus now being made in the Western World as a whole, along a West European as well as a North American line of approach, should have the, at first sight, paradoxical immediate effect of precipitating a fall in the mean level of Western culture.

This undesirable effect was to be expected in the first instance, not because Leisure was now still being bestowed, as it had always been, without regard to the recipient's capacity or incapacity for making use of it, but because it had also always taken even the choicest spirits time to learn how to make good use of any new gift. The pearls that were now being redistributed among a majority instead of remaining the monopoly of a minority were not being taken away from a minority consisting exclusively of connoisseurs in order to be cast before a majority consisting exclusively of swine who knew no better than to trample these precious offerings under their feet.¹ The misuse of Leisure by a majority of its possessors was, notoriously, no new thing. In the days when Leisure had been a monopoly of a minority, a majority of that minority had always misused it, as we have already observed.² Only a minority of that minority had made the creative use of Leisure that had been the main-spring of Civilization. The reason why, nevertheless, a redistribution of Leisure was likely to result in a lowering of the level of culture was that even the creative minority of a leisured minority had needed time to mature. The inestimably precious spiritual treasures that this minority had eventually created had been ripe fruits of self-education and self-discipline,³ and these had been the cumulative spiritual achievement of a series of consecutive generations. This was the secret of cultural creativity; and it was something that could not be transmitted by print-

¹ Matt. vii. 6.

² On p. 604, above.

³ The importance of the part that had been played by self-discipline in the creation of a Western Christian culture was indicated in the history of the word 'clerk', which, before its meaning had been depreciated to signify a worker who worked in an office and not in a factory, had once signified a possessor and trustee of culture, and had stood for this because, in Western Christendom, the original possessors and trustees of culture had been the clergy and, among them, above all, a disciplined minority that was enrolled in the monastic orders.

ing and distributing a sheet of directions for use. It was a secret that all new recipients of the gift of Leisure had to discover for themselves; and it could not be discovered in a day.

If this was the historic and intrinsic relation between Leisure and Culture, how were the Western Civilization's prospects likely to be affected by a current sacrifice of Culture on the altar of Social Justice? At a crisis in its history the Western Society was clipping the wings of a creative minority of a leisured minority and was lavishing leisure on a majority that had not yet had time to grow a new creative core. The immediate cultural effect of this equitable social revolution was as plain as it was deplorable.

'Over against the ever more amazing inventions of Science we see a kind of childishness creeping over our thoughts, our modes of expression, our art, our music, our morals. We talk in words from a very limited vocabulary, we produce pictures and statues of a more than ungainly "neo-primitiveness", we croon nigger songs while we push one another round a room in dances that need no brain, no zest, and no vitality for their successful performance. Many of our buildings have as their chief merits the fact that they can be rushed up quickly and finished within a few weeks. We tear over the Earth's surface along roads of brick-box straightness, past rows of houses of brick-box exactitude and hideousness, in order to get somewhere, it does not much matter where, in record time. Finally, the novels we read, apparently with pleasure, for there are many of them, show men and women as ill-conducted children whose one concern is that which they share with the animal world.

'There is to me something grim and horrible in an essentially mature civilisation playing at savage immaturity when it knows better. We cannot go back to the beginning of things any more than a mature mind can change into that of a child.'¹

These words spoken in A.D. 1933 by the headmistress of a distinguished school in London made a powerful impression at the time upon the writer of this Study; for, in the village in the North Riding of Yorkshire where he was reading the report in the press, he had neighbours who, at that moment, were giving hospitality to relatives of theirs who had been thrown out of work in Leeds by an 'economic blizzard' that was then sweeping over the face of an Industrialized World, and he had been hearing these countryfolk describe the impressions that their town-bred cousins had been making on them. The description had been forcible and vivid; for the good-natured hosts had been amazed and horrified by their progressive discovery of their unfortunate guests' extraordinary manners and customs.

'Why, they don't know how to cook and they don't know how to sew and they don't know how to cure a ham; and then, in the evenings, they can't even sit at home and talk, because they have nothing in their heads to talk about. Their only notion of enjoying themselves is to take the bus to Malton and kill time at an "entertainment"—"the pictures" or something of the kind.'

¹ Miss E. Strudwick, the Headmistress of St. Paul's Girls' School, Hammersmith, London, England, in a presidential address delivered on the 17th June, 1933, at Liverpool, at a Conference of the British Association of Head Mistresses. The text quoted here has been taken from the report in *The Manchester Guardian* of the 19th June, 1933.

In taking their town-bred guests' inability to entertain themselves as the crowning and damning evidence of their urban neobarbarism, these country cousins were touching the heart of a spiritual malady from which all classes of a contemporary industrialized society were suffering in all provinces of a mechanically standardized *Oikoumenê*. The malevolent sorceress Technology had inveigled her victims into putting themselves in her power by selling them new lamps for old. She had bribed them with 'the pictures' and 'the wireless' into selling her their souls; and the outcome of this ruinous cultural 'new deal' was the spiritual wilderness which Plato had dismissed as a 'Commonwealth of Swine'¹ and Aldous Huxley had satirized as a 'Brave New World'.

In a Westernizing World mid-way through the twentieth century of the Christian Era this Huxleian anti-utopia was a very present reality. The guests at Circe's banquet had soon found themselves penned in Circe's sty.² Their plight was plain beyond all dispute; the open question—and it was a vital one—was the length of their term of humiliating metamorphosis and irksome incarceration. In succumbing to the enchantment of a latter-day Western technology, had Mankind sentenced itself to languish in 'Brave New World' for the rest of its days on Earth? Or was there in the offing some still unenchanted Odysseus who, with Hermes' aid, might have it in his power to release his unfortunate comrades from duress and bring them back to their lost human shape? Was this sordid 'Commonwealth of Swine' the destiny that had been lying in wait for Mankind on a hitherto invisible ledge that had been the goal of human endeavours while Mankind had been striving to scale the climbers' pitch called 'Civilization'?³ If so, the fate of any climber who succeeded in attaining his objective on this pitch would be still more cruel than the doom of his fellows who had been falling to meet their deaths on a lower ledge that had been their common point of departure on this latest human enterprise. To wallow for ages in a 'Commonwealth of Swine' as a reward for having achieved Civilization would be as ironical a fate as the last phase of the primitive human societies that had been lying torpid for ages as their reward for having raised themselves from a sub-human level. An aeon of quarantine in Circe's sty might be the price that Mankind was doomed to pay for the boon of getting rid of War and Class-Conflict.

Was this a fate to which the Human Race was likely to resign itself? Would Human Nature really be content to 'live happily ever after' in a 'Brave New World' in which the only change from the monotony of a life spent on a frivolous employment of Leisure would be a modicum of mechanical work performed under restrictive trade-union rules in an unenthusiastic civil-service spirit? Even if a majority in each successive generation could be dragooned, drugged, hypnotized, or cajoled into living and dying like 'the beasts that perish',⁴ the stewards of a 'Commonwealth of Swine' would still have to reckon with a creative minority that had been the salt of the Earth⁵ in a pre-Porcine Age of human

history. The stewards would have to be past-masters in the technique of eugenics if they were to succeed in breeding out of Human Nature this angelically or demonically dynamic spiritual strain; and such mastery would probably prove to be beyond their capacity, for it could hardly be achieved without enlisting the aid of a creative intellectual activity which would be anathema in official circles in Hyampolis. Yet, if the managers of 'Brave New World' could not contrive to prevent the dynamic strain in the Spirit of Man from continuing to incarnate itself in a diaspora of untamed and untamable men and women, the security of their dehumanized commonwealth would never be complete; for the fatal flaw in the mechanism of a 'Brave New World' was its failure to provide a safety-valve for a spirit that would endure torture to the death rather than obey 'Brave New World's' first commandment: 'Et surtout, pas trop de zèle!'¹

The trouble that this spirit was likely to give to the ruling authorities in an oecumenical Hyampolis was foreshadowed in the history of the Roman Imperial Government's long losing battle with the Christian martyrs; for martyrdom was a response to the challenge of a régime that was keeping the peace at the price of taking the savour out of Human Life;² and the attractiveness of Christian martyrdom to zealous souls under a Roman Imperial dispensation was the more significant in view of the fact that, under a Roman Peace that was not literally world-wide, Christian martyrdom was not the only opportunity open to Roman citizens or subjects for putting all their heart and all their soul and all their strength and all their mind³ into the service of a cause that was worthy of being served with a wholehearted devotion. An alternative career in which they could sacrifice themselves like men instead of leading the life of human swine was offered to Roman citizens and subjects in the military police that held the cordon of the Roman Empire's anti-barbarian frontiers; and the *esprit de corps* of this magnificent force required its members to live up to a standard of professional conduct, in the performance of their military duty,⁴ which the Christian Church

¹ Attributed to Voltaire.

² The Roman Empire was, and was intended by its makers and masters to be, a 'Brave New World' inasmuch as its *raison d'être* was to prevent the recurrence of War and Class-Conflict at whatever cost in terms of repression of creativity. The Roman Imperial Government was suspicious of any move—even on a non-political plane—that might conceivably disturb the existing equilibrium. This apprehensive, defensive, repressive official attitude is illustrated in the story—*ben trovato, se non vero*—of the unfortunate subject of the Emperor Tiberius who, after succeeding in inventing a malleable kind of unbreakable glass, offered his invention to the Emperor in the hope of receiving a reward as a public benefactor. The Emperor's reaction was to give orders—after ascertaining that the secret of the process was, so far, known to no one beyond the inventor himself—that the new invention should be suppressed and the inventor be put to death as a dangerous character whose misguided activities were a threat to the stability of Society because his unbreakable glass, if ever put on the market, would bring about a catastrophic fall in the prices of the metals and would thereby precipitate an economic crisis. This story is told by Petronius Arbiter in his *Caena Trimalchionis*, chap. 51; by the Elder Pliny in his *Naturalis Historia*, Book XXXVI, chap. 26 (66), § 195; and in a garbled form by Dio Cassius in his *History of Rome*, Book LVII, chap. 21, *ad finem*. The emperor who is the villain of the story is anonymous ('Caesar') in Petronius's version, but the other two authorities both name Tiberius. The writer was directed to these sources by his sister Professor J. M. C. Toynbee.

³ Luke x. 27. Cp. Matt. xxii. 37. These passages in the Gospels are reminiscences of Deut. vi. 5; x. 12; xxx. 6.

⁴ Among the many well-known illustrations of the standard of conduct that was demanded and attained in the Imperial Roman Army, we may cite the gallantry of the

itself did not disdain to commend to its own members as a shining example.¹ A pagan cult of the Eagles that drew this tribute of admiration from Christian worshippers of God was the Roman Imperial régime's officially approved vent for spiritual energies that refused to live at low tension and insisted on exerting themselves to full capacity. Yet this politic provision of an outlet for a zeal that was an ineradicable and irrepressible element in Human Nature was proved inadequate by the epiphany of martyrs who insisted on laying down their lives, not in battle with barbarians in defence of the Hellenic World, but in defiance of Caesar himself for the glory of the One True God.

When a 'Brave New World' had thus bred martyrs with whom it could not cope in a Roman Empire where there was a military police to provide an alternative outlet for zeal, it seemed likely, *a fortiori*, to breed martyrs in a literally world-wide commonwealth in which no opportunities would be left for risking life and winning honour in the defence of Civilization against outer barbarians. In a twentieth-century *Oikoumenê* the vindication of spiritual freedom was the living generation's most urgent business, and the arena in which this spiritual battle would be lost or won would be a field of Leisure that in a fully mechanized world might come to be all but co-extensive with the field of Life itself.

(b) 'THE ARGONAUTS OF THE WESTERN PACIFIC'

What, in this field, was Hermes' sovereign antidote to Circe's nefarious magic? One negative answer to this question could be given without hesitation. The remedy for a frivolous misuse of an inordinately ample leisure could not lie in re-evoking the evil spirits of greed and lust for

Syrian soldier Sabinus, with his eleven comrades (see Josephus: *A History of the Romano-Jewish War*, Book VI, §§ 54-67), and of the Bithynian centurion Julianus (see Josephus, *ibid.*, §§ 81-90), during the Roman siege of Jerusalem in A.D. 70.

Professor William McNeill comments: 'I wonder whether the Roman soldier's experience can bear comparison with the Christian's conversion? Regular professional soldiers of my acquaintance are men attracted by pay and relatively easy conditions of work, not dedicated souls. I am inclined to imagine the Roman soldier as something like [that], and his occasional heroism as a psychological reaction against his normal "soldiering on the job"—a break-through of the instinct of workmanship, if you like.'

A non-American observer of American life in A.D. 1952 might point to the United States Marine Corps as an arm of the United States armed forces of the day that was animated by the same spirit of self-dedication as the Roman professional army in the Imperial Age. Neither a United States marine nor a Roman legionary was required to play the hero all day and every day; and many a member of either force might live out his term of service without ever having his *moral* put to the test of a practical ordeal. The rareness of the occasions for heroism is of the essence of any professional military service; the crucial question is whether, if and when the occasion does come, the troops have it in them to rise to it; and in this respect the professed Christian in the interior of the Roman Empire was in the same situation as the professional soldier on its frontiers. A professor of the Christian faith might live and die without ever being called upon to make the hard choice between apostasy and martyrdom; and in his case, as in the soldier's, the crucial question was how he would behave if and when the choice between honour and life ever did present itself for him personally. On this showing, there does perhaps, after all, seem to be something common between the Early Christian's and the contemporary Roman's attitude of mind, and standard of conduct; and, whatever may be the judgement of Modern Western historians on this point, it is attested by testimonials extant in the surviving literature of the Early Christian Church that the Christians themselves felt the standard of conduct in the Roman Army of the day to be closely enough akin to Christian ideals to be taken by Christians as an inspiring example for themselves.

¹ See the instances cited from Adolf Harnack's *Militia Christi* in VI. vii. 338-44.

power which had possessed Man in Process of Civilization; for that cure would be worse than the disease. The rebellious prisoner of 'Brave New World' would be stultifying his own efforts and ideals if he sought to make his escape by casting himself down the precipice which he had just scaled at so great a cost. The only line of escape that would be worth pursuing would be one leading, not downward, but upward. What upward openings, then, were there within the prisoner's sight and reach? If the most promising prelude to action is a recourse to the oracle of experience, the obvious first step for a hard beset twentieth-century *Homo Mechanicus* to take was to look into the experience of the primitive societies; for (strange though this might sound to twentieth-century Western ears) the spiritual problem of unemployment arising from a solution of the economic problem of scarcity had been encountered up to date, not by societies in process of civilization, but by primitive societies living on the margin of the *Oikoumenê*, where the pressure of the struggle for existence had always been at its lowest.¹ Primitive experience of a problem beyond Civilization's ken could be studied in the legend of the Lotus-Eaters² and in the fable of the Doasyoulikes³ and in the true history of the 'Argonauts of the Western Pacific'.⁴ Twentieth-century Melanesians had found a solution for the problem of total leisure by which their mythical counterparts had been worsted; and the experience and achievements of these primitive islanders were not without interest for their sophisticated Western contemporaries now that the same problem was overtaking these in their turn.

The Trobriand Islanders' first attempt to occupy an inordinately increasing leisure had failed to keep pace with the progressive aggravation of their problem.

¹ The Australian Blackfellows, for example, had proved to be at an advantage in this respect over the pioneers of Civilization who had eventually overtaken and all but exterminated them in their antipodean Ultima Thulé—as had once been discovered, to his surprise, by an airman who had fallen in with a vagrant food-gathering tribe of aborigines as a result of having had to make a forced landing at a remote spot in the interior of the Northern Territory. Wishing to give his unsophisticated hosts an overwhelming impression of his superiority in power and skill, the castaway took up his rifle, which had come down with him intact, and picked off one of the innumerable black swans that were riding on the waters of a lake on whose shore the wandering Blackfellows were encamped. He had duly demonstrated Civilization's power of taking life at long range, yet it was evident that the Blackfellows had not after all been impressed, and his chagrin and bewilderment must have been manifest on his countenance, for his considerate hosts lost no time in giving him a demonstration of the proper way to do the job. As soon as the rest of the swans, who had risen in flight from the water at the sound of the rifle-shot, had recovered from their alarm and had settled again, an aged Blackfellow daubed his hair with mud, crowned the daub with a bunch of waterplants, stuck a hollow reed into each of his nostrils, waded gently into the water, and disappeared under the surface. All that was now visible was a bunch of water plants, apparently drifting in the wind among the swans, with the ends of two broken reeds protruding from the water a few inches away. The swans were not alarmed, nor did the survivors take alarm when, one by one, some six or seven of their number softly and silently vanished under water and did not reappear. After a few seconds the old Blackfellow re-emerged from the lake bringing with him the six or seven swans whom he had caught and killed by seizing their legs, pulling them down, and drowning them. The Blackfellows' method of food-gathering was so crushingly superior to the rifleman's that, after all, it was no wonder that his rifle-shot had failed to hit its intended psychological mark. For this tribe, the problem of scarcity was non-existent so long as there was a mud-banked, reed-fringed, swan-covered lake in their universe.

³ See II. ii. 25-31.

⁴ See Malinowski, B.: *Argonauts of the Western Pacific* (London 1922, Routledge).

When the sensational productivity of a happy marriage between the yam and the local soil and climate had first plunged the human husbandmen into technological unemployment, they had tried to consume their redundant time and energy by devising ingenious non-economic refinements on their utilitarian agricultural operations.

'In gardening . . . the natives produce much more than they actually require, and in any average year they harvest perhaps twice as much as they can eat. . . . They produce this surplus in a manner which entails much more work than is strictly necessary for obtaining the crops. Much time and labour is given up to aesthetic purposes, to making the gardens tidy, clean, cleared of all debris; to building fine solid fences; to providing specially strong and big yam-poles. All these things are to some extent required for the growth of the plant; but there can be no doubt that the natives push their conscientiousness far beyond the limit of the purely necessary. The non-utilitarian element in their garden work is still more clearly perceptible in the various tasks which they carry out entirely for the sake of ornamentation in connexion with magical ceremonies and in obedience to tribal usage. . . .

'All, or almost all, the fruits of his work, and certainly any surplus which he can achieve by extra effort, goes, not to the man himself, but to his relatives-in-law. . . . But, although he thus derives practically no personal benefit in the utilitarian sense from his harvest, the gardener receives much praise and renown from its size and quality, and that in a direct and circumstantial manner. For all the crops, after being harvested, are displayed for some time afterwards in the gardens, piled up in neat conical heaps under small shelters made of yam vine. . . . Their yam houses are built so that the quantity of the food can be gauged, and its quality ascertained, through the wide interstices between the beams. . . . The yams are so arranged that the best specimens come to the outside and are well visible. . . . They will boast that . . . half of the yams will rot away in the storehouses and be thrown on . . . the rubbish heap at the back of the houses to make room for the new harvest. Here . . . we meet the typical idea that the main aim of accumulating food is to keep it exhibited in the yam houses till it rots and then can be replaced by a new *étalage*.'¹

Such ingenious methods as these for spinning out a stint of work had never been devised by any contemporary Western trade-unionist; but, in the Trobriand Islands, Adam's task was so fantastically productive that the islanders were hopelessly defeated in their efforts to lose their race against it. Do what they would, they could not make their agricultural work occupy more than half of their working time;² and at this critical point they gave proof of a power of imagination, amounting to genius, by finding a new occupation which did effectively consume all their surplus leisure, and which achieved this without leading them into mischief. The achievement was a remarkable one, considering that 'Satan finds some mischief still for idle hands to do',³ and that the *désœuvrés* Trobriand Islanders would not have had far to look for a bad example. They could have found it in their neighbours the Dobuans; for, in Dobu Island, Nature had been as niggardly to Man as she had

¹ Malinowski, B.: *Argonauts of the Western Pacific* (London 1922, Routledge), pp. 58-59, 61, 168, and 169.

² See *ibid.*, p. 58.

³ Watts, Isaac: *Divine Songs for Children*, xx: 'Against Idleness and Mischief'.

been bountiful in the Trobriand Islands; in Dobu, population pressed hard upon resources;¹ and 'from this island, in olden days, fierce and daring cannibal and head-hunting expeditions were periodically launched to the dread of the neighbouring tribes. . . . Districts . . . over a hundred miles away by sail never felt safe from the Dobuans.'² If the Trobriand Islanders had given ear to Satan's promptings, they might have found their solution for a problem of surplus leisure arising from a chronic excess of food production in a vicious Dobuan practice to which the Dobuans themselves had resorted as a remedy for the opposite evil of a chronic shortage in their home-grown food-supply. The Trobriand Islanders did follow the Dobuans' example in taking to long-distance voyages,³ but not in making head-hunting and cannibalism the objects of their seafaring. They invented an alternative object, which was as engrossing as it was harmless, in the institution of the Kula.⁴

The Kula was a continual long-distance maritime exchange of objects which—like the garlands of greenstuff that had once been the prizes for victory in the four classic oecumenical sporting events in the Hellenic World—had an economic value that was derisory and a psychological value that was inestimable. The international exchange of these objects was conducted in a closed maritime circuit, round which articles of two kinds (necklaces of red shell and bracelets of white shell), and these two kinds only, were constantly travelling in opposite directions and being exchanged for one another *en route*.

'Every movement of the Kula articles, every detail of the transactions, is fixed and regulated by a set of traditional rules and conventions, and some acts of the Kula are accompanied by an elaborate magical ritual and public ceremonies.'⁵

This ceremonial exchange of economically worthless treasures in a perpetually recurrent cycle was an occupation on which the Trobriand Islanders could be sure of being able to spend the whole of their spare time, even if their agriculture were one day to attain a degree of technical efficiency at which the maximum time that it could take up would approximate to zero.

The Trobriand Islanders' invention of this invincible leisure-consuming institution was a moral as well as an imaginative triumph; for the Kula was so irresistibly attractive an employment for a Melanesian human nature that even the abominable Dobuans were drawn into the Kula ring; and, though these proselytes operated this borrowed institution in the peculiar spirit of their own repulsive culture,⁶ their sharp practice in this ceremonial trade in non-economic commodities was at least a less objectionable offence against a Melanesian international code of good manners than their previous practice of sea-raiding to supply themselves with man-meat and human heads. The conversion of the

Dobuans from head-hunting to the Kula was a measure of the Trobriand Islanders' success in finding a satisfying alternative activity to the curse of hard labour—which had proved itself, by the awkwardness of the vacuum that it left when it was lifted, to have been a blessing in disguise to the progeny of a sinful Adam.

The Kula was a virtuoso's solution for a problem that the Trobriand Islanders' amateurish British contemporaries were seeking to solve by eating city dinners, dancing attendance on the hunting, fishing, shooting, and social seasons, and looking on at horse and dog races and cricket and football matches; but the justness of this comparison was a reminder that the Kula and its contemporary Western counterparts were not solutions that could satisfy the Soul's spiritual aspirations; for these effectively time-killing occupations had been kept morally innocent only at the price of being made spiritually fatuous; creation, not mere recreation, was the true end of Man; and, since the creative spark in Man had happily shown itself to be inextinguishable, neither the Kula nor a grosser contemporary Western regimen of bread and circuses¹ could bring true spiritual salvation to the spellbound prisoners in Circe's sty.

(c) THE SPIRITUAL ODYSSEY OF THE WESTERN WORLD

Where then would a prospectively out-of-work Mankind have to look for a better employment of a morally perilous leisure than was to be found in either a Kula or a Lord Mayor's Show? Two of the Human Soul's higher faculties were Thought and Art; and the past exercise of these two faculties by Man in Process of Civilization had demonstrated that their fields of activity were boundless. In any future society that had sense and grace as well as leisure, the moving spirits would assuredly see to it that their fellow men's and women's intellectual and aesthetic capacities were given the best opportunities for coming to flower that an enlightened education could provide. Yet it seemed unlikely—as far as could be foreseen before this cultural experiment had been tried—that Thought and Art would prove to be activities in which a majority of Mankind could find their lifework; for Thought and Art appeared to be intrinsically esoteric in their nature, in the sense of requiring for their cultivation an innate spiritual gift with which only a minority was endowed; and this rare endowment was no talisman of spiritual perfection. 'To the purely spiritual, the intellectual but stand in a sort of corporeal relation'.² If the solution for Man's problem of total leisure lay in expending it in the service of some high calling to which all men would find themselves able to devote their lives, then Mankind must turn again for salvation to Religion; for the one employment of total Leisure that offered an infinite spiritual scope to Everyman was the use of this challenging gift for the glory of the God who had bestowed it.

Whatever the religious future of a Westernizing World might prove to be, a post-Christian chapter of Western history had already made it clear that, in some form, a banished Religion was going to return in any event; for it had not proved so easy, after all, to give the Hound of

¹ 'Panem et circenses' (*Juvenal*: Satire X, l. 81).

² Melville, H.: *Moby Dick*, chap. xlv.

Heaven¹ the slip. Rather than relinquish His pursuit of His spiritual prey,² He had resumed it in the guise of a hell hound; and a liberal-minded and rationalist-minded society which had facilely assumed that it had rid itself of fanaticism for ever by exorcizing it on the ecclesiastical plane had lived to see it break out again with seven-fold virulence on political and economic planes on which the complacent watchman had been off his guard.

Mid-way through the twentieth century of the Christian Era it was already evident that the choice before Western Man was, not whether he was to be religious or irreligious, but whether his spiritual allegiance was to be given to this religion or to that; and in a scientific-minded society this choice between competing religions was limited virtually to two alternatives. A twentieth-century Western World might either return to a Christian worship of the God who is Love as well as Power, or it might succumb to a Narcissan worship of Man's own hypnotizing image. In an age in which Human Technology had so decisively and sensationally subjugated Non-Human Nature, it was no longer possible for Man to find a third alternative in a return to the worship of a Magna Mater who had been the principal object of Man's worship before the higher religions had made their epiphany in the wake of Civilization's higher technology. A generation that had discovered how to 'annihilate distance' and how to split the atom might be more prone than any of its predecessors to fall into the deadly error of deifying Man, but it had effectively debarred itself from recapturing a primitive vision of Non-Human Nature as the Great Mother of gods and men.

A Physical Universe that a Western Science had stripped naked and dissected could no longer be mistaken for a Theotókos. At the most she might be personified poetically as one of God's daughters; and the error of according to her some of the worship due exclusively to God Himself was a pitfall into which a twentieth-century Western worshipper of the One True God would have no excuse for falling, considering that, in a seventh-century Mecca, the Prophet Muhammed, at a time when his prophetic mission had been at its nadir, had manfully overcome a momentary temptation to compromise with the traditional idolatry of his compatriots by associating the three goddesses of the Ka'bah—Manat, Allat, and al-'Uzzā—with the worship of an Allah whose daughters these goddesses had been deemed to be.³ The One True God and His creature Man were the sole two possible alternative objects of worship for a *Homo Faber Mechanicus*; and the choice between these two competitors for victory, in the final round of a struggle for existence between religions that was coeval with Mankind, had been brought to a crisis by a triumph of Human Technology over Non-Human Nature which had conclusively discredited the primitive worship of a Magna Mater.

Now that a conquered Material Universe was out of the running, Man Himself was the greatest power of which Man had any indisputable

direct experience; and the critical question was whether a scientifically warrantable worship of a visible and tangible human idol would now follow up a victory over the scientifically exploded worship of Cybele by also putting to rout a worship of God—considering that a faith which was ‘the substance of things hoped for, the evidence of things not seen’,¹ was the only justification for worshipping a God whom no man had seen at any time.² ‘Through faith we understand that the worlds were framed by the word of God, so that things which are seen were not made of things which do appear’;³ but this faith was not countenanced by Science; and, long before Man had been led into a temptation to worship the Human Mind by the intellectually triumphant sequel to a seventeenth-century Western Scientific Revolution, Man-worship had already come to be the characteristic idolatry of Man in Process of Civilization, since one aspect of Civilization had been Man’s progressive conquest of Non-Human Nature.

The response to the challenge of this first wave of Man-worship had been the epiphany of the higher religions; and it had been no accident that these had made their appearance and won their footing at times and places at which human beings had temporarily learnt the salutary lesson of disillusionment with Civilization from the suffering that had been inflicted on them by the breakdowns and disintegrations of the civilizations of an early generation. The spiritually educative effects of this creative experience of suffering had, however, afterwards been overwhelmed by the impetus of the triumphant resurgence of Civilization in the Modern Age of a Western Society’s history. The evidence of things not seen had been rejected, and the substance of things hoped for had been devalued, by a Modern Western Man from whom a Westernizing majority of Mankind had latterly been learning to take its cue. Was this the last word in the story? The four principal surviving higher religions—the Mahāyāna, Hinduism, Christianity, and Islam—had all consistently spoken with one voice in proclaiming the truth that Man was not God. Was their consensus on this negative yet crucial point now to be overruled in a second reading of the bill? A Christian Church Militant had started its career by challenging a cult of Dea Roma and Divus Caesar that had been one of the most respectable and beneficent expressions of Man-worship so far devised. Were the heirs of the Christian martyrs who had given their lives to win the Church’s battle against the deification of an Hellenic universal state now to capitulate to the worship of Leviathan in the cruder and wickedder latter-day Western forms of Fascism and Communism? The key to an answer to this question was to be found in the significance and prospects of a current domestic controversy within the bosom of the neo-pagan church whose religion was the worship of Humanity.

In an earlier chapter of this Part⁴ we have already noticed that the real issue between Communism and a traditional Western way of life was not the economic issue between Socialism and Freedom for Private Economic Enterprise which was the ostensible subject of contention. We

¹ Heb. xi. 1.

³ Heb. xi. 3.

² 1 John iv. 12.

⁴ On p. 584, above.

have seen that this economic issue masked a religious one that was of much greater account and was therefore much more difficult to settle, and we have identified this religious issue as a conflict between two incompatible versions of the cult of a human idol. Communism was preaching that Man's divinity lay in Man's collective material power, while Liberalism was preaching that it lay in men's individual and personal freedom; and we have already committed ourselves to the forecast that, in a struggle for the spiritual allegiance of Mankind in which the only two competitors in the lists were the Communists' idol Leviathan and the Liberals' idol Homunculus, Leviathan could not fail to win the day.

The Liberals had, in fact, virtually admitted defeat when they had stooped to alloying their Liberalism with Nationalism; for this partial apostasy was not merely a confession that their proper godling Homunculus was an unsatisfying object of worship; it was also a confession that the Communists' idol Leviathan was verily the one true god, since, on the road from Liberalism to Communism, Nationalism was a half-way house at which there could be no permanent abiding place for the harassed *ci-devant* Liberal traveller. In becoming a nationalist the Liberal had in fact inadvertently but irrevocably become a fellow-traveller with his Communist adversary, since Nationalism, in unison with Communism and in contrast to Liberalism, was a worship of Collective Man, and the only substantial difference between these two varieties of the cult of Leviathan was that Communism was a worship of the collective human beast in its oecumenical entirety, whereas Nationalism was a worship of it in fragments chipped off to constitute parochial states. When even in the mundane sphere of economic and political and military affairs these idolized parochial states had already become untenable anachronisms, it was hard to believe that they could long continue to command the ideological allegiance of ex-Christians who, if their hearts were set on worshipping Collective Man, could find ready to hand, in Communism, an alternative form of Leviathan-worship that was more satisfying, more rational, and more practical.

The encounter between a Communist and a Liberal ideology on a twentieth-century Western religious battlefield was not unlike the encounter between the French gendarmes and the Genoese crossbowmen in the first phase of the Battle of Crécy. The two contingents of a twentieth-century man-worshipping army were in the field against the same God-worshipping adversaries; but, before either or both of them could join battle with their common theist enemy, they had first to settle accounts with one another; and, in this preliminary heat, the Communist devotees of Leviathan, in their attitude towards the Liberal patrons of Homunculus, were showing all the impatience and contempt that the French Knights had displayed in dealing with the French Crown's Genoese mercenaries on the 26th August, 1346. In twentieth-century Communist eyes the Liberal Western advocates of Individual Liberty were as ineffective in combat as the Genoese crossbowmen had been found by their French employers to be when their bowstrings had gone slack as a result of an improvident exposure to the rain. These useless

troops in the van of the atheist army's order of battle were now standing in the way of a Marxian task-force that had the weapons and the will to bring the battle to a decision by charging home. To Communist minds the only open question was whether the Liberals had been making fools of themselves unintentionally in allowing their weapons to be put out of action by the weather and in taking up a position in which they were now nothing but a nuisance to their own side, or whether their ostensible ineptitude was in reality a cunning camouflage for a treacherous collusion with theists who, in theory, were Liberalism's and Communism's common enemies. The Communist answer to this question would be the verdict on Liberalism in the court of Marxian history; but for current practical purposes the question was academic; for the Marxian heavy cavalry had already made up their minds that they must clear the field for a decisive assault upon their ultimate adversaries the theists by riding the obstructive Liberals down; and, whether the prospective victims of this military necessity were fools or whether they were knaves, the necessity was in either case imperative.

In the face of the Communists' implacable determination to sweep the Liberals out of their path, the Liberals were in a sorry plight; for the negative Liberal ideal of civil liberty for individual men and women was as ineffective a weapon as an unstrung crossbow to pit against the positive Communist ideal of a self-sacrificing devotion to the service of a Collective Humanity. The apparent grandeur of the Communist ideal made the Liberal ideal appear trivial; yet there was one unquestionably genuine fact with which these appearances did not tally, and this was that in their allegiance to a seemingly trivial ideal the Liberals were thoroughly in earnest. Their belief in individual liberty, and the willingness of at least a few zealous souls to demonstrate their sincerity by going to the length of dying for this belief in the last resort at the hands of National Socialist German and Communist Russian and Chinese persecutors, were the one article of faith and the one spark of the martyrs' fiery spirit that were unquestionably still alive in a post-Christian Western World which had deliberately repudiated its title to the name 'Western Christendom'.¹ Considering how feeble this latter-day Western ideal of personal liberty appeared to be when it was held up to scorn against the foil of Communism's zeal for the welfare of the Human Race, it might seem strange that it should have retained so singular a hold upon the feelings of an otherwise prosaically utilitarian-minded society. What was the explanation of this mystery?

In attempting to explain the strength of a twentieth-century Western feeling for Liberty, an historian's first move would be to look into its origins; and he would begin his retrospective investigation by pointing out that the Liberals were allowing the Communists to do them a gross injustice in allowing them to state the issue between Liberalism and Communism in economic terms. The right of private *entrepreneurs* to take their profits might indeed seem a less worthy cause to champion than the right of Mankind to make its collective economic interests prevail over the selfish economic aims of a few able or privileged individuals; but this

¹ See I. i. 34.

exclusively economic interpretation of Liberalism was, of course, a travesty of it. The freedom which the Western Liberals had most at heart was not a freedom for the rich to make profits at the expense of the poor; it was a freedom for anyone of any class to express an unpopular opinion, advocate an unpopular policy, and co-operate for these unpopular purposes with other representatives of a like-minded minority of the community. This civil liberty was the freedom for which the members of a twentieth-century Western Society were prepared to fight and die; and they set this supreme value on civil liberty because they were aware that it was the palladium of Democracy; but this was only the latest chapter in the story; for civil liberty had been prized in the West long before the selfconscious resuscitation of a defunct Hellenic political ideal at the beginning of the Modern Age of Western history.¹

The Western cult of civil liberty was not only older than a Modern Western democracy; it was also older than a Medieval Western parliamentarism, as was witnessed in the English rendering of Western constitutional history by the chronological fact that King John's signature of Magna Carta in A.D. 1215 had preceded by thirty-nine years the summoning of the first rudiment of a representative parliament in A.D. 1254. A passion for personal liberty on the political plane had in fact been a Modern Western democracy's priceless heritage from a Medieval Western aristocracy; but the feudal barons had not been the creators of this Western ideal of liberty, and politics had not been the plane on which it had first risen above the Western World's horizon. The Western ideal of personal liberty had made its epiphany on the religious plane, and this before the first rudiments of a Western Civilization had begun to take shape out of the chaos of a post-Hellenic interregnum; for this Western belief in personal liberty was part of the Western Society's spiritual heritage from Christianity, and its provenance was attested by 'the visionary gleam' of a halo of unearthly light that still made this ideal glow and shine, and so still made it thrill the hearts of men and women with its radiance, even after it had been debased into a prosaic twentieth-century Western secular concern to preserve the freedom of business men to make economic profits.

Not in entire forgetfulness,
And not in utter nakedness,
But trailing clouds of glory do we come
From God, who is our home.²

A latter-day Western belief in the value of personal liberty was a faded vestige of an original Christian belief in the brotherhood of Man; and this Christian belief in the brotherhood of Man was a corollary of a Christian discovery—or revelation—of the fatherhood of God, for which the First Epistle General of John was the *locus classicus*.

'Behold what manner of love the Father hath bestowed upon us, that we should be called the sons of God. . . . And this commandment have we from him, that he who loveth God love his brother also.'³

¹ See pp. 3 and 7-8, above.

² Wordsworth, William: *Ode on Intimations of Immortality from Recollections of Early Childhood*.
³ 1 John iii. 1 and iv. 21.

A belief in the absolute and inestimable value of personal liberty, which was neither intellectually nor morally defensible when Liberty was claimed as the divine right of an impiously deified Homunculus, would take on a very different colour if this miserable pretender to the divinity of his Creator were to be salvaged from the worship of himself by again receiving 'the spirit of adoption whereby we cry "Abba, Father!"';¹ for 'the glorious liberty of the children of God', into which 'the creature itself also shall be delivered from the bondage of corruption',² was a cause in which Christians, vindicating it against the tyranny of an idolatrous worship of Leviathan, could lay down their lives, if need be, with a sure conviction that this was a worthy cause for martyrdom.

If we have accounted correctly for the abiding sincerity and earnestness of a twentieth-century Western belief in personal liberty by tracing this belief back to its historic Christian origin, we have perhaps performed for a hard-pressed Liberalism a service that might have saved the lives of the unfortunate Genoese soldiers on the field of Crécy if they could have done the same thing for themselves on the morning of the 26th August, 1346. We have rearmed our Liberal crossbowman by restoring the tone of his perished Christian bow-string; and, in thus effectively reconditioning his paralysed weapon, we have given him the power to turn the tables on his Communist assailant; for a crossbow in working order is more than a match for antique swords and lances. The historian's intervention with his time-machine³ will, in fact, have given the battle a new turn. The mail-clad horsemen will make their charge with the same recklessly confident *élan* as ever, but this time their shrift will be short, for they will never arrive within range of the expectant longbowmen's shafts; they will meet their deaths *en route* at the hands of the interloping crossbowmen whom they had imagined to be at their mercy and had been expecting to trample under foot. They will be slain by bolts shot at point-blank range from unexpectedly restrung arbalests.

This military simile was an enlightening allegory of the religious issue that a post-Christian Liberalism was being forced to face under the mounting pressure of a post-Christian Communism's challenge. On the neo-pagan terms on which this spiritual battle had been joined, Liberalism was hopelessly outmatched; for Communism had been able to put the *élan* of its heritage of Christian enthusiasm into its worship of the idol Leviathan, while Liberalism had condemned itself to unstringing its bow by taking as its counter-idol an Homunculus whose pretension to divinity was so patently spurious as to be incapable of kindling any glimmer of Christian zeal. This contemptible little idol might have been adequate for meeting a Western Society's ideological requirements during a comfortable nineteenth-century vacation, when Islam's once loud challenge to the Western World had fallen silent before any Western ear had yet begun to catch the first sound of a Communist Russian heavy cavalry's oncoming horse-hoofs; but by the middle of the twentieth century, when this new horde of charging Oriental cataphracts was bearing down, full tilt, upon a shaken Occidental infantry, it had become manifest that a nineteenth-century belief in civil liberty

¹ Rom. viii. 15.

² Rom. viii. 21.

³ See V. vi. 214-15.

was no adequate armament for meeting the impetuous attack of the most formidable assailant that the Franks had yet encountered.

The Communist onslaught had thus forced upon its Western victims a drastic choice between two extreme alternatives. Either the Westerners must resign themselves to seeing the defeat of a Western ideal of personal liberty that had been depotentiated in the process of being secularized, or else they must reinstate this now gravely imperilled ideal in its original Christian setting, since it was only through being reconsecrated that the ideal of Liberty could be revalidated. In forcing this choice upon a post-Christian Western Society, a post-Christian Russian Society was unintentionally doing an inestimably valuable service to its unloved sister; for it was thrusting into its Western adversary's unnerved hand the one spiritual weapon that had the power to turn the balance in the hitherto weaker combatant's favour. In a struggle between the two conflicting ideals of Freedom and Totalitarianism in which the cause of Freedom was at a desperate disadvantage so long as Freedom meant nothing more than a secular civil liberty, the idol Leviathan might still be triumphantly defied and defeated by souls contending for the liberty of Conscience and risking martyrdom for the glory of God.

If a latter-day Western Liberalism was to be retransfigured into the religion that was the fountain-light of all its day and the master-light of all its seeing,¹ it would have to carry out both a negative and a positive spiritual exercise.

Its negative task would be to recapture a saving humility. The first lesson in humility, for a society that had won a dominion over non-Human Nature by enthroning Natural Science in a dethroned Religion's seat, would be to acknowledge and confess the spiritual impotence of a Mechanized Technology that had proved itself capable of moving physical mountains;² and the palinode that was now demanded of the Western scientific intellect could not be evaded by the gesture of replacing a Newtonian 'God the Engineer' by an Einsteinian 'God the Mathematician'.³ This perfunctory twentieth-century Western etherialization of a complacent eighteenth-century Western deism would not be enough to restore sick Western souls to spiritual health; for, though

¹ Wordsworth, *op. cit.*

² The writer can remember an occasion in one of the museums in London when he was gazing, as a child, at a beautiful fragment of Medieval Western stained glass and was listening to his mother's comment that this was the one Medieval Western art of which the Modern Western World had lost the secret. This remark made a lasting impression on his mind, because, for this mind at that age, an admission of the possibility of retrogression, even in one single art, had been as disquieting as it had been novel. In his subsequent musings over this recollection of early childhood, the writer gradually came to perceive that, while the loss of any technique was something portentous in a social milieu in which Technology was *in excelsis*, the Modern Western World's loss of the Medieval Western technique of making stained glass was particularly significant. It was indeed no accident that this particular technique should have been the first to have slipped out of a Modern Western virtuoso's hand; for, of all Medieval Western techniques, the making of stained glass had been the one in which Technology had been the most dependent for its success upon its marriage with Spirituality; and the repudiation of a Medieval Western spirituality had been the price of the sensational advance of a secularized Modern Western science.

³ 'We have already considered with disfavour the possibility of the Universe having been planned by a biologist or an engineer; from the intrinsic evidence of His creation, the Great Architect of the Universe now begins to appear as a pure mathematician' (Jeans, Sir James: *The Mysterious Universe* (Cambridge 1930, University Press), p. 134).

these second thoughts of Western minds might be commended as the beginning of wisdom,¹ they would not exempt Western hearts from the duty and ordeal of conversion. Abashed Western intellects must follow the Hellenic example set by Socrates when he turned away from the study of an outer physical universe to the exploration of an inner spiritual one.² Contrite Western souls must accept a contemporary Asian verdict that 'Western science is ignorant of the distinction between worldly knowledge and godly knowledge'³ and a classical Hellenic verdict that 'omnia . . . ista sagacitas hominum, non sapientia, invenit'.⁴

'The first scientific quest was concerned, not with the nature of the Objective Universe, but with the central problem of human fate.⁵ Dream-interpretation, Divination and Astrology, the three great branches of Primitive Science, all attempted to answer the most poignant questions about the fundamental nature of Man. These questions still remain unanswered. . . . We know very well that the specific quest of the early intuitive sciences was not taken over by the scientific disciplines which superseded them. . . . Because of the immense success and prestige of the scientific *Weltanschauung*, it was hardly noticed until recently that these central problems of the Human Soul had been omitted from the fields of Modern Science and Philosophy. . . . It would be idle to contend that extraversted Science and Religion do not serve real human ends. Their social, ethical, and cultural values are manifest. But the Soul of Man is still athirst for the essential things which were left behind in the pre-scientific limbo—things which have lain dormant but are not dead. In the Unconscious they await the day of resurrection, ready to break through whenever the spiritual quest is undertaken anew, clothed perhaps in strange archaic garb, and whispering their primordial longings to our dreaming minds.'⁶

The negative act of spiritual purification through humility would be a necessary preliminary to this positive act of replenishing an empty Western cistern from well-springs in which the living waters of Religion had never run dry; and these sources for a renewal of Western Man's spiritual life were unlikely to be found either in Western or in Russian geological formations; for History and Scripture had testified with a conclusive unanimity that the parts of Caesar and Christ could never both be played by the same person or same people. If either the Americans or the Russians were to cast themselves for the Caesarean role of putting a distracted *Oikoumenê* into political and material order, they would thereby be disqualifying themselves for becoming candidates for the privilege of being chosen to be the prophets of a spiritual revival, while the West European peoples would have to face the hard truth that their recent forfeiture of their ephemeral power did not carry with it any guarantee that these *ex-conquistadores*, *ex-proconsuls*, and *ex-entre-*

preneurs would be compensated for their material losses by the receipt of a consolation prize in the shape of a prophet's mantle opportunely descending upon their shivering shoulders to cover their unwonted nakedness. After having provided a Westernizing World with its leaven, its workshop, and its cockpit in swift succession, Western Europe under a future *Pax Americana* seemed likely to settle down, like Greece under a *Pax Romana*, into the uninspiring role of a museum for conserving the relics of a departed greatness; and in the era of a Marshall Plan and a Festival of Britain, as in the days of the Antonines and Aulus Gellius, *ex Oriente lux*.

This had been the theme of the friars' chant in the Temple of Jupiter that had fallen on Gibbon's ears on the 15th October, 1764;¹ and, though the impenetrable complacency of an eighteenth-century *Zeitgeist*, in which Gibbon's talent had been lapped, had not permitted even this master mind to perceive that the subject on which his muse was inviting him to write was Man's mysterious spiritual ascent on the wings of material catastrophe,² and not the familiar vanity of Man's mundane ambitions,³ the learning that comes only through suffering had begun to enlighten far more commonplace souls than Gibbon's within less than two centuries after the great historian had failed to catch the undertones of 'the bare-footed fryars' descant. The friars' unfading song had outlasted the Forum's brief clamour and the Campo Vaccino's long silence; and by the beginning of the sixth decade of the twentieth century of the Christian Era a disoriented Western moth had already begun to hover wistfully round an unextinguished Oriental candle, according to the testimony of at least one contemporary Western psychiatrist, reporting his own clinical experience.

'Despite intellectual resistance, the Unconscious of the West turns irresistibly to the East; for there the "heliocentric" structure of the Self has long been realised, and the greater psychological depth and insight of Oriental philosophy comes directly from this recognition. . . . Allusions to Eastern ideas are liable to occur in a [Western] patient's material just at the critical juncture where the one thing needful is to be able to see things differently. These people are seriously seeking a more comprehensive view of themselves and of the Universe than that provided by their own background. Naturally, only those who have felt cramped and stultified by the traditional [Western] view of the Soul, which divided it arbitrarily into black and white, will be prompted to subject authoritative moral categories to psychological understanding. But, once the sheep and the goats have escaped from their respective folds, they can never again be herded into authoritarian enclosures. . . . Our tendency to think of instincts as separate and distinct entities makes it difficult to understand Psychology in terms of elementary dynamic principles; but the Unconscious still thinks in the grand manner of Ancient China: "There are

¹ *The Autobiographies of Edward Gibbon*, edited by Murray, J. (London 1896, Murray), p. 302. This experience of Gibbon's is discussed in the present Study in II. ii. 210, n. 1; IV. iv. 58-63; and XIII. x. 98-107.

² See VII. vii. 423-5 and 551-5.

³ Ecclesiastes had reduced this topic to a truism by his immortal statement of it in the twelve words of the second verse of his first chapter, and, though the *tour de force* of making these dry bones live (Ezek. xxxvii. 1-10) was to be achieved by Shelley in the fourteen lines of his *Ozymandias of Egypt*, this feat was beyond the compass of Gibbon's ponderous genius.

three elements: Heaven, Earth and Man". The age-long veneration of the swan, the goose, and the stork is the evidence of Man's constant need to find some reconciling symbol which could unite this elementary opposition in his nature. . . . The Chinese naturalistic conception . . . reduces the terrors of the moral conflict, in which the Soul swings dizzily between salvation and perdition, to the play of natural forces—Yang and Yin.¹

In a Westernizing World mid-way through the twentieth century of the Christian Era, the time was indeed ripe for the onset of a new Yang-movement to carry Western souls back from their long obsession with an extraverted Physical Science towards a fresh quest for the divine Dweller in the Innermost.² In the chapter of Western history that was now coming to a close, Western souls had disqualified themselves for the pursuit of this quest; for 'der Gott der mir im Busen wohnt'³ does not act in a material medium; His activity is the passivity of Wu Wei in which His spiritual energy is at its acme;⁴ He would not be Himself if He made His epiphany in the physical energy of the external universe of His creation; and therefore a Modern Western *Homo Faber Mechanicus* could fancy that he had no use for this *Deus Absconditus*⁵ so long as he was preoccupied with his own victorious assault upon his material environment. But now, at the moment when this act of material conquest was being consummated by the extraordinary prowess of a scientific Western technology, the conqueror had been confronted by the ironical discovery that the very completeness of his triumph had placed in jeopardy, not merely the Earthly Paradise that he had seemed to be on, the verge of recapturing, but perhaps even the survival of Life on Earth, which had never before been under threat of being extinguished by Man's maleficence.

The devastating agency that Western Man had thus let loose to his own mortal peril was not the physical force generated by splitting an atom; it was the spiritual force generated by a schism in the Soul; but, happily for Mankind's prospects in both This World and an Other World, the inadvertently liberated *jinn* was not evil in its essence; its titanic power was capable of working as much good, if it were rightly guided, as it was bound to work evil if it were allowed to run riot; and now, primed and poised for action, demonic or angelic, this potent spirit was awaiting a sign from the alchemist who had unintentionally liberated it from the alembic in which he had been conducting his excessively ingenious physical experiments. If he was to give himself a chance of self-preservation, the distractingly possessed *majnūn* technologist must now recognize, and act upon, the truth that, 'of all tools used in the shadow of the Moon, men are [the] most apt to get out of order'.⁶ He must throw aside the physical tools with which he had been mastering his material environment, in order to concentrate his efforts on the now

⁵ 'Vere tu es Deus absconditus, Deus Israel salvator' (Isa. xlv. 15, in the Vulgate Latin text).

⁶ Melville, H.: *Moby Dick*, chap. xlv.

far more urgent task of re-conquering an inner spiritual world that had slipped out of his control while he had been engrossed in his unduly prolonged child's-play with clockwork; for this spiritual world was the field in which lay buried his pearl of great price¹—his master tool consisting of his Self; and 'what shall a man give in exchange for his soul?'² A Western Man who had all but gained the whole World could not recapture his lost self till he had made his peace with his fellow men and women, with his Subconscious Human Nature, and with his God; and he must first turn again to worship a *Latens Deitas*³ if he was to have any hope of achieving an eventual reconciliation with his fellows and with himself. He must reorient his spiritual outlook by once more taking for his *qiblah* his father Abraham's Mecca in place of his prospector Bentham's New Jerusalem.

If this act of reconversion was what was required of Western souls seeking, at the eleventh hour, to find salvation, was it possible to estimate how far they had already travelled by this date on their spiritual Odyssey, and what experiences they had been encountering on the way? By the time when, under the surface of Western Man's spiritual life, the Subconscious Psyche was somnambulantly veering eastward, a vanguard of more alert—or more apprehensive—Western spirits had been racing so far ahead that they had already reached a critical divide in the road. *Hic locus est partis ubi se via findit in ambas*;⁴ and this parting of the ways was critical because of the contrast between the two spiritual *terrains* into which the forking branches led; for one of them was as invitingly sheltering as the other was deterrently bleak.

In this valley of decision,⁵ where the prodigal found himself confronted by the two frowning baetyls that had been waiting for his arrival there to bear witness against him,⁶ his temptation was to retreat into the bosom of some established church enshrining some historic higher religion.

Rock of Ages, cleft for me,
Let me hide myself in Thee.⁷

In the spiritual life of the Western World mid-way through the twentieth century of the Christian Era there were already unmistakable signs of a movement of withdrawal that had been detected, and been stigmatized as 'the second bout of religiosity' (*die zweite Religiosität*), by a Western philosopher writing on the morrow of a First World War.⁸ In the disintegration of the Hellenic Civilization, this tendency to seek shelter in a reversion to traditional religious observances had begun to be perceptible in the second century B.C., after the onset of the second paroxysm of an

⁵ Joel iii. 14.

⁶ Auden, W. H.: *The Two Witnesses*.

⁷ In the writer of this hymn, A. M. Toplady, Western Man's subconscious psyche was as prescient as it was complacent in the author of *The History of the Decline and Fall of the Roman Empire*. Toplady published *Rock of Ages* in A.D. 1775, a year before the date of the publication of the first volume of Gibbon's work.

⁸ See Spengler, O.: *Der Untergang des Abendlandes*, vol. ii (Munich 1922, Beck), pp. 381-3.

Hellenic Time of Troubles;¹ in the disintegration of the Sinic Civilization, it had come to a head under the *Pax Hanica*.²

'The second bout of religiosity is the inevitable counterpart of Caesarism, which is the final political constitution of all disintegrating civilisations in their last phase (*später Zivilisationen*).³ . . . The creations of this [latter-day] piety have no more originality about them than is to be found in the form of the Roman Imperium. There is no constructive activity, no development of any idea. The phenomenon resembles the [optical] effect of the dispersal of a mist that has been shrouding a landscape: the old familiar forms begin to reappear—hazily at first, and then in clearer and clearer outline. The content of religiosity in this second bout is, once again, just what it was in the first authentic early bout, save for a difference of nuance in the experience and expression of it. The first symptom is the disappearance of Rationalism; the next symptom is the emergence of the forms of the Early Age of Growth (*der Frühzeit*); the last symptom is the resurrection of the whole universe of the primitive religions, which had been compelled to give way to the grandiose forms of an Early [Higher] Religion (*des Frühgläubens*), and which now bursts out again, with an impetus that will not be denied, in a proletarian syncretism⁴ which is a never failing feature of every civilisation (*Kultur*) in this phase.'⁵

This vista of spiritual regression becomes attractive to self-deconsecrated souls even in the heyday of Rationalism, before their first experience of the nemesis of Rationalism has begun to shake their nerve.

'Materialism would not be complete if it did not feel a need now and again to escape from its psychological tension by letting itself fall into mythopoeic moods, by indulging in some kind of religious ritual, and by finding relief from an internal pressure in allowing itself to savour the charm of something irrational, something alien, something bizarre and, in the last resort, something sheerly silly.'⁶

This gravitational pull will become doubly strong when the truant from the fold of an established religion has experienced—like Gibbon at Lausanne after the outbreak of the French Revolution—the shock of suddenly finding himself on the brink of a catastrophe that he had never foreboded. In this unhappy plight the impulse to take cover by retreating into the abyss of the Subconscious Psyche's beatifically infantile *Nirvāna* out of the storm-swept eyrie of an adult consciousness is as natural as the instinct of an unweaned baby kangaroo to wriggle back into its mother's pouch at its first alarming encounter with the challenging presence of a dangerous world outside. Yet, however natural the promptings of spiritual cowardice may be, they are seldom either admirable or expedient; and a post-Christian Western Society's temptation to seek refuge from the consequences of its own technological handiwork by begging for readmittance into the fold of a conventional Christian orthodoxy was neither morally nor intellectually defensible. The impulse to indulge in 'a second bout' of traditional religion is, indeed, merely a manifestation,

⁶ Ibid., p. 381.

on the religious plane,¹ of an Archaism which, on all planes, we have found, in an earlier context, to be a bolt-hole that is always a trap because it invariably proves to be a blind alley.

Archaistic religious movements are intellectually indefensible because the antecedent Rationalism that has driven a traditional religious faith off the field does not in reality just come and go like the fog with which Spengler misleadingly equates Rationalism in his simile. It would be nearer to the truth to identify the fog with the alien matter which a higher religion, after its descent from Heaven, picks up and carries along with it on its terrestrial journey.² The onset of Rationalism will then assume the appearance of a process, not of obfuscation, but of enlightenment (*Aufklärung*); and it is a harder task for Psyche to undo the effects of enlightenment by reassembling the mental fog that the advent of Rationalism has once dispersed than it has been for her, in that antecedent chapter of her mental history, to disperse the fog by directing upon it the rays of enlightenment. This unaccommodating truth has been proclaimed, with an authority derived from personal experience, by a Muslim theologian-mystic who had the courage to face the loss of his religion for the sake of winning an opportunity of recovering it through an act of transfiguration.

"There is no hope in returning to a traditional faith after it has once been abandoned, since the essential condition in the holder of a traditional faith is that he should not know that he is a traditionalist. Whenever he knows that, the glass of his traditional faith is broken. That is a breaking that cannot be mended, and a separating that cannot be united by any sewing or putting together, except it be melted in the fire and given another new form."³

Souls that have once had the experience of intellectual enlightenment can never thereafter find spiritual salvation by committing intellectual suicide; and, though the quest of recapturing their lost faith is in itself both intellectually and morally legitimate, agnostics who embark on this quest will not find themselves able to worship God again in spirit and in truth⁴ if they seek to open for themselves a homeward spiritual path by deliberately closing their mind's critical eye and by making a virtue of refusing henceforth to follow an argument fearlessly wherever it may lead them. In a would-be return to Religion, the path of intellectual dishonesty can lead only to worshipping we know not what;⁵ for Reason, like Faith, is a goddess with whom Man cannot take the liberty of playing fast and loose—as though these mighty *numina* were cringing curs whom a capricious human master could break in to complying slavishly with his wayward mood. Faith and Reason cannot be alternately dismissed with a kick and then called back to heel with a whistle to suit Man's volatile fancy or changing convenience.

⁴ John iv. 23-24.

⁵ John iv. 22.

If a once conventionally orthodox Muslim religious genius had been able to divine that it was intellectually impracticable to re-embrace a lost traditional religious faith *telle quelle*, it ought to be manifest to an ex-Christian soul that the temptation to take spiritual cover is morally reprehensible; for the attempt to put Christianity into action must mean trying to follow Christ's example; and the impulse of an ex-Christian on the run to find a hiding-place in Christ's riven side ran directly counter to the spirit and significance of Christ's incarnation. The essential and distinctive Christian belief about the nature and action of God was that a Person of the Trinity 'who, being in the form of God, counted it not a prize to be on an equality with God',¹ had been moved, by the Love that He was,² to divest Himself of His divine impassibility in order to come down from Heaven and be made man and suffer death for the sake of us men and our salvation.

'[He] emptied Himself (*ἑαυτὸν ἐκένωσε*), taking the form of a servant, being made in the likeness of men; and, being found in fashion as a man, He humbled Himself and became obedient unto death, even the death of the cross.'³

The example set by Christ for Christians was an example, not of shrinking from the suffering inherent in Human Nature, but of accepting it for the sake of saving human beings whom their Creator loved with a love that led Him to die for them as His brethren.

If a belief and an ideal that were the heart of Christianity did not give pause to an unnerved ex-Christian rationalist in panic flight back to the shelter of a traditional Christian orthodoxy, the fugitive might perhaps find an alternative example to fortify his *moral* in the history of another higher religion which latterly had been brought within the ken of Western minds as a result of the technological unification of the *Oikoumenê*.

The Mahāyāna, which shared with Christianity, Islam, and Hinduism the historic role of being one of the four surviving oecumenical higher religions, had sprung from a Buddhist philosophy which had concentrated on ethics to the exclusion of metaphysics and had valued ethics for their practical utility in offering to sentient beings a way of escape from suffering. In divining that the experience of pain was an inseparable concomitant of consciousness and will, the Buddha had shown a penetrating psychological insight. The moral weakness of the philosophy founded on the Buddha's teaching was that, in its compassionate concern to liberate Life from suffering, it was willing to condemn Life to lose its savour by counselling it to relapse into a beatific subconsciousness; and Buddhism fell into this spiritual error because it allowed itself to ignore the truth that, in extinguishing pain at this price, Man was also renouncing his highest capacities for good. In an Hellenic spiritual environment, Gautama's contemporary Aeschylus had divined that, for Human Nature, suffering was the necessary price of learning;⁴ and Christianity was to add the revelation that suffering was also the necessary means of grace. The Indic philosophy had started on its course by precluding itself from

² Phil. ii. 7-8, Revised Version.

³ 1 John iv. 8 and 16.

⁴ *πάθει μάθος*.—Aeschylus: *Agamemnon*, l. 177, quoted in this Study *passim*.

taking cognizance of suffering's spiritual and intellectual value; and, considering the unpropitiousness of this start, it is remarkable and significant that, in the next chapter of the history of Buddhism's spiritual development, one sect of Buddhists should have discovered for themselves, by experience, that the evasion of suffering at any price was not a spiritual objective whose pursuit was a spiritually satisfying way of life.

The spiritual fruit of this Christian lesson of Buddhist experience was, as we have noticed in other contexts,¹ the transfiguration of a philosophy of escape into a religion of salvation through the rejection of the Hinayanian arhat's self-centred ideal of getting rid of his suffering self by anaesthetizing his own consciousness and the adoption, instead, of the Mahayanian bodhisattva's self-sacrificing ideal of helping his fellow living beings to make the arduous passage to the arhat's goal at the cost of postponing his own entry into his rest.² The bodhisattva's concern to rid himself of himself counts with him for so much less than his compassion for his kind that Love moves him to tarry, for an aeon if need be, in an excruciating state of consciousness after he has won his own right of entry into *Nirvāṇa* by the perfect performance of an arhat's spiritual exercises. The bodhisattva has it in his power to release himself from suffering by crossing the threshold of *Nirvāṇa* at any moment that he might choose, and the one desire that still fetters him to the pains of sentient life is the self-transcendent desire to put his own dearly bought experience at his fellows' disposal by serving them as their psychopomp.³ The transit from the Hinayāna to the Mahāyāna is thus nothing less than a spiritual revolution, and a Christian disciple of Buddhism would not quarrel with the Mahayanian sect of Buddhists for calling the ideal of the bodhisattva 'the Great Way', and the ideal of the arhat 'the Little Way', of interpreting the Buddha's teaching; for the bodhisattva's ideal was an imitation of Christ that was not the less authentic for being undesigned.⁴

The ideal of the bodhisattva was assuredly an example that the Western World could not afford to disregard in a generation in which it was in retreat towards the inviting shelter of a traditional form of Christianity; for the characteristic virtue of a bodhisattva was his fortitude in withstanding a perpetual temptation to desert his self-assigned post in a world of painful action in order to take the short cut to oblivion that lay perpetually open to him. In the latter half of the twentieth century of the Christian Era such fortitude as this was the first spiritual necessity for Western souls on the religious plane as well as on the political. In his politics, as we have seen,⁵ Western Man's task in this chapter of Western history was to school himself to 'living dangerously', without yielding to the temptation of trying to resolve the tension either by capitulating or by committing aggression, in an *Oikoumenē* that had been overtaken by the invention of the atomic bomb before it had achieved political unity. In

³ See IX. viii. 628.

⁴ See VII. vii. 733. The rise of the Mahāyāna is accounted for by a yearning, in Buddhist souls, for the Christian graces of love and self-sacrifice for which a Primitive Buddhist philosophy found no place.

⁵ On pp. 525-9, above.

his religious life in the same age, a comparable endurance in the exercise of self-command was the spiritual feat that was required of him.

Western souls, apprised by experience of the limits and the nemesis of Rationalism, must school themselves, in their consequent quest for reconciliation with God, to the prospect of finding themselves commanded by Conscience to check their panic impulse to try to force a premature entry into the Promised Land. They must repress their eagerness to take sanctuary again on soil hallowed by the tombs of the Patriarchs. They must even face the prospect that Conscience's injunction might sentence them to end their days in the Wilderness, like the generation of Israelites who after their exodus from Egypt had had to wander in the Wilderness for forty years until not a man of them was left alive save Caleb the son of Jephunneh and Joshua the son of Nun;¹ and they must steel themselves by recalling that in that generation the sternest test of fortitude had been reserved for the Israelite in whom God had been best pleased; for Moses' last experience in This Life had been a tantalizing Pishgah sight² of a Promised Land which his own feet were never to tread. 'I have caused thee to see it with thine eyes, but thou shalt not go over thither'³ had been the last words of the Lord that had fallen on a dying Moses' ears.⁴

The temptation to run for shelter and the duty of riding the storm have been eloquently described by a nineteenth-century Western man of letters who divined, with the intuition of a poet, a truth that his generation came and went too early to have learnt from experience.

'All deep earnest thinking is but the intrepid effort of the Soul to keep the open independence of her sea, while the wildest winds of Heaven and Earth conspire to cast her on the treacherous, slavish shore. But, as in landlessness alone resides the highest truth, shoreless, indefinite as God—so, better is it to perish in that howling infinite than be ingloriously dashed upon the lee, even if that were safety.'⁵

The writer of this Study, who happened to have been born into a generation in whose time this ordeal had come to be a common Western experience, once had a personal intimation of the truth uttered by Herman Melville. In the summer of A.D. 1936, in a time of physical sickness and spiritual travail, he dreamed, during a spell of sleep in a wakeful night, that he was clasping the foot of the crucifix hanging over the high altar

¹ Num. xiv. 26-35 and xxvi. 64-65.

² Deut. xxxiv. 1.

³ Deut. xxxiv. 4.

⁴ A few weeks after he had written this passage, the writer came across a characteristically sincere and noble exposition of the same idea by a Western scholar-banker of an older generation, Walter Leaf (*vivebat* A.D. 1852-1927), with whom the writer had the good fortune to become personally acquainted after the publication of Leaf's *Troy, A Study in Homeric Geography* (London 1912, Macmillan), when Leaf was preparing for the press his *Homer and History* (London 1915, Macmillan).

⁵ 'I am sure that we are working together to win a new form in which all the hearts of men will again be able to join in common worship, as they have hardly been able to do for many years. But the time does not seem near yet; and meanwhile a great deal of painful lonely groping has to be done by each one for himself. New faiths, like children, must be brought forth in sorrow, and many souls will have to pass through struggles greater than they can bear. . . . I feel that the minds of all men are slowly working their way from Trouble to Truth' (Walter Leaf, letters written on the 1st and the 4th April, 1894, to Charlotte M. Symonds, before their marriage on the 22nd May, 1894, in *Walter Leaf* (London 1932, John Murray), by Charlotte M. Leaf, pp. 180 and 182).

⁵ Melville, Herman: *Moby Dick*, chap. xxiii.

of the Abbey of Ampleforth and was hearing a voice saying to him *Amplexus expecta* ('Cling and wait').

An impetuous spiritual traveller on the road back to Religion from Agnosticism might be inclined to interpret this dream as an irresolute soul's subconscious apologia; and the postponement of a decision that was ripe for being taken would indeed convict the procrastinator of a culpable weakness of will; but the judgement on Fabius must be founded on a right reading of his situation and his motive; and in the spiritual circumstances of a twentieth-century Western Society an ex-agnostic who took *expectans expectavi*¹ for his watchword, without allowing himself to cry 'Make haste, O Lord, to help me',² would be clear of the imputation of irresoluteness if his motive for resisting the temptation to pray for a shortening of the term of his trial was a resolve to face and act upon the truth that in a latter-day Western spiritual Odyssey the dire passage of Time was a necessary means of grace in virtue of its being an inevitable source of suffering.

This spiritual necessity for a painful period of probation could have been short-circuited with impunity only if it had been possible for a twentieth-century Western *ci-devant* Christian agnostic to take a traditional form of Christianity as he found it; but this would have meant taking it back as he had left it; and that would have been no solution for either the agnostic's or the Church's contemporary problem; for the progressive decay of a belief in, and an allegiance to, an ancestral religion, which had been the note of a Western Society's spiritual history since the latter decades of the seventeenth century of the Christian Era, had not been due solely to Modern Western Man's perversity nor even solely to his bewitchment by his intellect's entrancing scientific discoveries and by this fascinating science's lucrative technological fruits. The responsibility for Modern Western Man's apostasy was shared with the apostate by a Western Christian Church that had eventually alienated its long-suffering votaries by its grievous sins of both heart and head.³

The moral scandal through which the Western Church had forfeited Western Man's esteem had been a schism that it had allowed to rankle into the savage Western Wars of Religion (*saeviebant* A.D. 1562-1660); and the morally shattering effect of this resort to military force in pursuance of an ecclesiastical feud has been noticed in this Study in earlier contexts.⁴ The intellectual scandal which had consummated a Western Church Militant's self-stultification in Western eyes had been its reaction to a Modern Western movement of intellectual enlightenment (*Aufklärung*) for which the Wars of Religion had opened the door and the subsequent Scientific Revolution had paved the way. The Western Christian churches' response to an intellectual challenge which their moral iniquity had brought upon them had been to discredit themselves intellectually as well. They had taken the stand that their traditional creed, including the whole cumulus of accretions acquired from pre-Christian pagan religions and from Hellenic science and philosophy, was

¹ Ps. xxxix. i, in the Vulgate Latin text; Ps. xl. i, in the English A.V.

an organic unity in which all articles of belief were equally sacrosanct; and they had fought as stubbornly to retain an exploded Ptolemaic astronomy, Aristotelian theology, and Isiac or Cybelene mythology as if this pre-Christian flotsam¹ had been as close to the heart of Christianity as the truth that God is Love and as God's witness to this truth in Christ's incarnation and crucifixion. These were the issues on which the Western Christian churches' once obedient flock had parted company with their ecclesiastical shepherds.

'The diseased have ye not strengthened, neither have ye healed that which was sick, neither have ye bound up that which was broken, neither have ye brought again that which was driven away, neither have ye sought that which was lost; but with force and with cruelty have ye ruled them.'²

And, though, by the middle of the twentieth century, a quarter of a millennium had passed since the flock had begun to scatter, the issues that had driven sheep and shepherds apart were still standing like a wall between them.

It was true that in the meantime the churches had ceased to assert their creeds and claims by force of arms; yet they had persisted in making War an instrument of ecclesiastical policy so long as they had been able to persuade any secular governments to put their armed forces at the churchmen's service. The churches had also been jettisoning one after another of their non-Christian intellectual paraphernalia; yet they had clung to them till they had become untenable and had abandoned them with the reluctance of a mother throwing her child to the wolves or of a senile mundane empire recognizing the independence of disaffected and insurgent provinces which it has shown itself impotent either to reconcile or to re-subdue. The estranging issues thus still remained open 250 years or more after the date at which they had come to a head; and, whatever God's eventual judgement on unfaithful shepherds and truant sheep might be, it was manifest, even to human eyes, in the writer's generation (*vivebat* A.D. 1889—), that a change of heart was required on both sides. The streams must be cleansed of the mud that had fouled the waters, and the land must be cleared of the jungle that had overgrown the pastures, before the flocks could return without being confronted immediately with a choice between scattering again and staying to die of hunger and thirst.

At this point a champion of a traditional orthodoxy might be moved to ask by what authority this process of purification was to be carried out. Supposing that churchmen were to concede that a purification was necessary, must they not also insist that this task was the Church's prerogative? Would semi-penitent agnostics have the effrontery to claim that they would be better hands at winnowing the chaff out of the wheat than the official heirs of an unbroken apostolic succession? Would the prodigal have the hardihood to stipulate that his re-entry into his father's house must be conditional on its being guaranteed to him in advance that the Church would submit its time-honoured traditions to his philistine judgement? These questions would be legitimate and pertinent enough to require an answer; and the present writer's personal answer

¹ See VII. vii. 455-6.

² Ezek. xxxiv. 4.

to them would be that the task of winnowing the chaff out of the traditional form of Christianity—or any other living higher religion—was a task to which both the two human parties to the case would find their own unaided judgement and insight unequal. An agnostic who could show a valid scientific warrant for challenging the Church's apostolic authority would be plunging out of his own depth if he then went on to claim for himself an alternative scientific authority to replace a traditional ecclesiastical chart by a revolutionary lay blue-print; for a petrified higher religion could not be requickened by methods that might serve for reconditioning an obsolete industrial plant. A futuristic reconstruction of Christianity by reconverted agnostics and an archaistic restoration of it by trustees of a traditional orthodoxy would both be impracticable for the same reason; and the reason was that no human hands could anticipate the operation of the Holy Spirit.¹

If it were then to be asked how the dayspring from on high had ever come to visit human souls through God's tender mercy,² the answer would be that 'whom the Lord loveth He chasteneth, and scourgeth every son whom he receiveth', and that, 'if ye endure chastening, God dealeth with you as sons.'³ If Christianity was to be requickened in agnostic Western souls through a winnowing of the chaff out of the wheat,⁴ this palingenesis could be achieved only through suffering; and suffering is an experience that takes Time—and takes it at a length which is proportionate to the measure of the chastening that is required for the sufferer's salvation. If this is the truth, then what was required, above all things, of homeward-faring agnostic Western souls in the twentieth century of the Christian Era was the creative endurance exemplified in the age-long ministries of the bodhisattvas. Resisting the temptation to hide themselves in the rock, and facing the blast of the rushing mighty wind⁵ that bloweth where it listeth,⁶ these pilgrims through the Valley of the Shadow of Death⁷ must let suffering do its unhurrying work within them till, in the fullness of times and seasons which it was not for them to know,⁸ they should receive power⁹ through the anguish of being born of the spirit.¹⁰

(d) THE 'LAW' OF PSYCHOLOGICAL COMPENSATION

A reader who has had the patience to follow the foregoing argument from its opening in a prospect of technological unemployment to its close in a vigil in expectation of a Day of Pentecost may be inclined to ask the sceptic's question 'How can these things be?'¹¹

In a world whose economic and political life had been caught in the grip of regimentation, how could there be any hope of a spiritual revival on the religious plane? Does not this speculation conflict with previous findings in this Study? Have not the chapters dealing with encounters between contemporaries led to the conclusion that every culture is an organic whole in which all the parts prove, on trial, to be interdependent, however independent of one another some of them may seem to be at

first sight?¹ And have we not noticed² that, among the processes or tendencies that are thus apt to spread from one part of a body social to another, mechanization is apt to be particularly infectious? In previous chapters of the present Part of this Study³ we have been watching the spread of regimentation from the economic to the political plane of life in an Industrialized Western Society. What ground could there be there for expecting to see the process of infection come to a halt at this point, if a body social is the highly conductive medium that we have found it to be? We have quoted Bergson's authority for the possibility that '*la mécanique, en se développant, pourra se retourner contre la mystique*';⁴ and this was surely what was to be expected if we have been on the right track in our findings that the fabric of Society is highly conductive. Has this finding now to be disavowed? Or, if it holds good, does it not open up a different prospect for the Western Society than the vista that we have been sketching? Does it not suggest that, in a chapter of Western history that was on the horizon in A.D. 1952, the religious plane of life, so far from being likely to be a scene of spiritual travail coming to flower in spiritual creation, was likely to succumb to the arid social climate of regimentation which had come to prevail on the economic and political planes already? If it is in truth the nature of any culture to be all of a piece, could the religious life of the Western World have any chance of escaping the blight of a creeping paralysis which had fastened upon its economic life in the restrictive practices of Trade Unionism and on its political life in the *éthos* of a conscientious but unenthusiastic civil service?

The answer to this hypothetical objection would be that it had sprung from a misconception arising from the ambiguity of the phrase 'all of a piece'; for a fabric might be said to be all of a piece so long as it was a seamless web, even if the threads interwoven in it were of diverse stuffs, diverse twists, and diverse colours, while alternatively the same phrase might be used to describe a web whose texture was homogeneous in the sense that the interwoven threads were uniform with one another. If the latter and ampler of these two senses had been the one in which we had found the structure of a body social to be 'all of a piece', this finding would indeed have been incompatible with a vista of the Western Civilization's prospects in which a regimentation of its life on the economic and political planes might still leave room on the religious plane for freedom and creativity; but this is not in fact the true account of our finding. The truth is that the interdependence which we have observed in the relation between the several parts of a body social is the interdependence of interwoven elements that differ from one another in kind; and our forecast of the Western Civilization's prospects, so far from being in contradiction with this observation, has been partly founded upon it. Our observation that all the elements of a culture are apt to be interdependent was the ground for our prediction that some revolutionary change in the Western Society's religious life was likely to occur as a result of the revolu-

⁴ Bergson, H.: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), p. 252, quoted in this Study in IV. iv. 126.

tionary changes produced in the Western Society's economic and political life by the psychological effects of the mechanization of its technology; but changes that are inter-related and concomitant do not, on that account, all have to take a single uniform course.

Indeed, so far from the regimentation of Western life on the economic and political planes being likely to induce a regimentation of Western life on the religious plane as well, it seemed likely to militate against this; for one of the devices by which Life achieves the *tour de force* of keeping itself alive is by compensating for a deficit or a surplus in one department by accumulating a surplus or incurring a deficit in another. Considering the importance of this 'law's' role in Life's perpetual struggle for survival, we should expect *a priori* that, in a social milieu in which, as in the twentieth-century Western case in point, there is a deficit of freedom or surplus of regimentation in Economics and Politics, the combined effect of the working of 'the law of interdependence' and 'the law of compensation' would be to produce a surplus of freedom or deficit of regimentation in Religion. This had, for example, been the history of the Hellenic Civilization in its universal state. After the wars and social conflicts of an Hellenic Time of Troubles had been effectively suppressed by the imposition of an Augustan Peace, the psychic energy that had thus been deprived of its former vent in Politics and Economics had found a new vent in Religion. The dullness of a world in which War had been banished to anti-barbarian frontiers beyond the horizon,¹ and in which the sterilization of Politics had taken the heart out of public speaking,² had been effectively relieved on the religious plane by a compensatory outbreak of Christian martyrdom. This psychological compensation had been effective because there could be no surer way of making Life worth living again than to rediscover a cause for which it was worth sacrificing it. It will be seen that this chapter of Hellenic history was a precedent that was significant for Western prospects.

One lesson of this Hellenic episode was that in Life there is always an irreducible minimum of psychic energy that will insist on discharging itself through some channel or other; but it is equally true, as we have observed in an earlier context,³ that there is also a maximum limit to the quantity of psychic energy which Life has at its disposal; and from this it follows that, if a reinforcement of energy is required for putting a greater drive into one activity, the requisite additional supply will have to be obtained by making economies of energy in other quarters. Life's device for economizing energy is mechanization. For example, by making the beating of the heart and the alternating inflation and deflation of the lungs automatic in the human body, Life had released human thought and will for other uses than the continual maintenance of physical vitality from moment to moment. If a conscious act of thought and act of will had never ceased to be required for the initiation of each successive breath and successive heart-beat, no human being would ever have had any margin of intellectual or volitional energy to spare for doing anything else than just keeping alive; or, to state the point more accurately, no sub-human being would ever have succeeded in becoming human. On

¹ See VI. vii. 122-3.

² See V. vi. 80-81.

³ In IV. iv. 125.

the analogy of this creative effect of the economy of energy in the life of Man's body physical, we might surmise that, in the life of his body social, Religion would be likely to be starved so long as thought and will were pre-occupied with Economics (as they had been in the West since the Industrial Revolution) and with Politics (as they had been in the West since the Western renaissance of a deified Hellenic state);¹ and we might infer from this that the regimentation that was now being imposed on the Western Society's economic and political life would be likely to liberate Western souls for fulfilling the true end of Man by glorifying God and enjoying Him once again.

This happier spiritual prospect was at least a possibility in which a dispirited generation of Western men and women might catch a beckoning gleam of kindly light; and, with this possibility in view, an historian recalling the history of the emergence of the Western Civilization out of a post-Hellenic interregnum would recollect that, in that episode, a psychic energy that had been transferred from Economics to Religion during an antecedent Hellenic Civilization's disintegration had eventually produced, as an incidental economic by-product of a life in which Religion had come to be the lode-star, economic effects which had been beyond the compass of a Roman oecumenical government commanding the total resources of a great society and the skill, experience, and good will of an admirable professional civil service. A decline and fall of agriculture in Italy, which the imperial Roman régime had proved as impotent to arrest as had their republican predecessors the Gracchi, was not only arrested but was reversed by monks of the Benedictine Order following the rule of a founder who had prescribed for his spiritual sons a daily stint of manual labour as an alternative way of serving God that would provide a psychologically wholesome foil to the singing of the Liturgy.²

This first chapter of Western history might perhaps repeat itself in a chapter that, in A.D. 1952, still lay unwritten in the womb of the Future. The transfer of psychic energy to Religion from Economics might once again save *Homo Economicus* from himself by saving him from the necessity of artificially reducing his economic productivity as the only means at his command for defending himself against the noxious effects of an excessive economic appetite. In previous chapters³ we have noticed that the demonic physical 'drive' which Modern Western Man had put into his economic activities through the mechanization of his technology had manufactured a psychological brake for itself by generating the trade-union spirit in the industrial working class and the civil-service spirit in the middle class. These defensive psychic mechanisms had proved effective for the negative purpose for which they had been mounted; but they had protected *Homo Faber Mechanicus* against the tyranny of his clockwork at the cost of taking the heart out of his handiwork, and they had taken the heart out of his handiwork at the cost of depotentiating economic activities on which the mechanization of Technology had placed too grievously heavy a psychic load. It might be that, in the long

¹ See X. ix. 7-15.

² See III. iii. 266, with the passages quoted there, in footnotes 2 and 3, from Saint Benedict's Rule.

³ On pp. 563-74 and 604-6, above.

run the transfer of energy from Economics to Religion would justify itself from the chartered accountant's, as well as from the spiritual pastor's, point of view.

If the transfer of energy from Religion to Economics at the opening of the Modern Age of Western history had shot a bolt that had subsequently come home to roost like a boomerang in the economic field, it was conceivable that a re-transfer of energy from Economics to Religion at the opening of a post-Modern Age might ultimately come to a self-stultified Western *Homo Economicus*'s rescue. Under the aegis of Religion, Western Man might find himself able to handle with spiritual impunity the material power thrust into his hands by the mechanization of Western technology. A neo-pagan Frankenstein who had been enslaved by the monster that he had made might live to become this monstrous mechanism's once more Christian master; for, if the Western Society's progressive economic self-defeat since the Industrial Revolution had proved the truth of the saying in the Gospels that 'from him that hath not, even that he hath shall be taken away from him',¹ this saying was inseparable from its context 'that unto every one which hath shall be given', and this complementary *logion* was illustrated in the legend of Solomon's choice in his dream by night at Gibeon.² When the dreamer had responded to God's challenging invitation 'Ask what I shall give thee' by asking God to give his servant an understanding heart to judge God's people, he had been rewarded for his unselfseeking choice of a spiritual gift by being given, over and above this, the mundane riches and honour for which he had not asked. This Syriac legend might be taken by Western souls as a parable of the choice before them in the twentieth century of the Christian Era.

F. THE STRAITS AHEAD

IF the foregoing appreciation of the prospects of the Western Civilization in A.D. 1952 has not fallen altogether wide of the mark, the general conclusion that is to be drawn from it is not obscure. At this date the feat that had to be performed by Western navigators on the face of the waters of History was to pilot their vessel, without disaster, through perilous straits in the hope of making their way into more open waters beyond; and in this post-Christian Odyssey there was more than one passage to be negotiated and more than one kind of ordeal to be faced.

In terms of our Mediterranean maritime simile, we may compare the social and spiritual enterprise to which these Western adventurers were committed in the twentieth century of the Christian Era with the navigational task confronting Hellenic mariners in the sixth century B.C. who had bidden farewell to their Ionian homeland and had set sail westward rather than submit to the alien dominion of un-Hellenic-minded Achae-menidae. Following in Odysseus' wake, these Phocaeen seafarers would have first to negotiate the straits between Sicily and Italy without approaching either an Italian shore where they would be pounced upon by the monster Scylla or a Sicilian shore where they would be engulfed by the whirlpool Charybdis; but, if, by managing to steer their course along the narrow fairway through this first danger-zone, they should succeed in making the friendly port of Marseilles, they would not there find themselves at rest in the haven where they would be;¹ for their bold and skilful negotiation of the Straits of Messina would merely have carried them from the inner basin into the outer basin of the Mediterranean, without having liberated them from the imprisoning shores of their landlocked native sea.

If they were to reach the boundless waters of a globe-encompassing Ocean, these voyagers must put to sea again from the sheltering harbour of their mother country's daughter city in order to make for the Straits of Gibraltar between the Pillars of Hercules, where this pair of menacing mountains, towering above the African and the European shore and threatening, from either flank, to fall upon any ship audacious enough to run the gauntlet without their leave, were visible embodiments of Imperial Carthage's decree that no Hellenic vessel was ever to sail on through this golden gate leading out from the landlocked waters into the main. And here woe betide the Hellenic mariner who allowed himself to be intimidated by his adversary's veto into following the Theban Pindar's poor-spirited advice to his Agrigentine patron Thêrôn.

'And now Thêrôn's achievements have carried him to the limit: they have brought him to the Pillars of Hercules on his long voyage from home; and what lies beyond this terminus is out of bounds (*ἄβατον*) for all men, wise or witless. I will not pursue this venture. I should deserve to lose my senses if I did this senseless thing!'²

¹ Ps. cvii. 30.

² Pindar: *Odes in Honour of Victors in the Olympic Games*, Ode iii, ll. 43-45.

Ne plus ultra! These were the very words that a forbidding Carthaginian statesmanship had been intending to extort from defeatist Hellenic lips; and, so long as this self-imposed Hellenic psychological inhibition held, no Hellenic explorer would ever sail on to test the truth of a later poet's intuition that the untried passage of the Ocean would prove to be the avenue to a New World.¹ More than two thousand years were to pass before Columbus's victorious defiance of the veto once imposed by a jealous Carthage was to be commemorated, in the device of 'the dollar sign', by the first sovereign on whose globe-encircling dominions the Sun could never set.² On coins minted for Charles V out of American bullion, the antistrophic words *Plus ultra!* were triumphantly inscribed on a scroll displayed behind the minatory pair of pillars;³ and the moral was one which a twentieth-century Odysseus ought to take to heart if this series of episodes in the history of the art of navigation was an apt parable of the spiritual voyage on which his sails were set.

In the interpretation of this parable in terms of the Western Civilization's prospects, the finding of a passage between Scylla and Charybdis signified the negotiation of the Western World's immediate problem of finding some way of avoiding self-destruction without falling into self-stultification. Mid-way through the twentieth century of the Christian Era the Western Society was in imminent danger of destroying itself by failing to stop making War now that a demonic drive had been put into War by the progress of a Western physical science; and it was in hardly less imminent danger of stultifying itself by seeking asylum from War and Class-Conflict in Circe's pig-sty. If post-Christian Western souls did succeed in threading their way between these two immediate perils, they would owe their happy issue out of this affliction to an inspiration to take Religion as the mark on which they were once more to set their course; but an impulse to return to Religion would not in itself suffice to bring the Western pilgrims' ships out of inland waters into open sea; for the call of Religion was being uttered in diverse tongues;⁴ and the questions to which the agnostic Western pioneer in search of a Christian oracle would have, at his own peril, to find an answer for himself, were:

'Are all apostles? Are all prophets? Are all teachers? . . . Have all the gifts of healing? . . . Do all interpret?'⁵

In this spiritual ordeal the forbidding Pillars of Hercules were a pair of rival authoritarian and dogmatic faiths, both of which alike were offer-

¹ Seneca: *Medea*, ll. 364-79, quoted in II. i. 263, n. 1.

² See IX. viii. 428, n. 9.

³ See Raymond, Wayte: *The Silver Dollars of North and South America* (New York 1939, Wayte Raymond, Inc.) for photographs of dollars coined for the Spanish Crown, over a series of reigns ranging from Charles V's (*regnabat* A.D. 1516-56) to the break-up of the Spanish Empire of the Indies in the nineteenth century of the Christian Era, which display the pair of pillars with the motto *Plus ultra*. On 46 of the 67 specimens (not counting 'necessity coins') of 'pillar type' coins here reproduced, including the earliest in the series, Charles V's coin from Santo Domingo (p. 18, No. 1), the two words are inscribed on a single scroll linking the pillars (and passing behind an heraldic shield inserted between the pillars on coins of this type minted for the Bourbons). On fifteen specimens, each of the two pillars is wreathed in a separate scroll of its own, with 'Plus' inscribed on the left-hand scroll and 'Ultra' on the right-hand scroll. On six specimens, including Philip II's dollar minted in Peru (reproduced in Supplement, p. 3, No. A 1), the motto is inscribed behind or above the pillars without being mounted on a scroll.

⁴ 1 Cor. xii. 28.

⁵ 1 Cor. xii. 29-30.

ing to the storm-tossed voyager an everlasting *Nirvāna* in their stony bosoms and were threatening him with the eternal punishment that had been inflicted on the Flying Dutchman if he were to be so impious and so fool-hardy as to reject their offer and sail on past them out into the blue. From the one shore this ultimatum was being delivered to Western souls by a Christian heresy in which the stone of Communism had been substituted for the bread¹ of the Gospel, and from the other shore by a Christian Orthodoxy in which the body of Christ,² who had 'come that they might have life, and that they might have it more abundantly',³ had been petrified into a pillar of salt⁴ by a backward-looking ecclesiastical tradition. To dare the passage between these two frowning Pillars of Hercules was a venture that might daunt even a mariner whose *moral* had been fortified by a previous success in making his way safely between Scylla and Charybdis. But, if, at this supremely critical point in his voyage, the pilgrim were to feel his heart failing, he might recover his courage and initiative by taking his oracle from Paul's First Epistle to the Corinthians:

'Covet earnestly the best gifts; and yet show I unto you a more excellent way.'⁵

If a contrite humility was the first of the Christian virtues that were necessary for the Western pilgrim's salvation, an indomitable endurance was the second. What was required of him at this hour was to hold on his course and to trust in God's grace; and, if he prayed God to grant him a pilot for the perilous passage, he would find the bodhisattva psychopompus whom he was seeking in a Francesco Bernardone of Assisi, who was the most god-like soul that had been born into the Western World so far. A disciple of Saint Francis who followed faithfully enough in the saint's footsteps to participate in the saint's gift of receiving Christ's stigmata would know, with the knowledge that comes only through suffering, that his sacrifice had been accepted by the Lord.⁶ *Asperges me hyssopo et mundabor.*⁷

THE CONFLICTING THEORIES OF SURVIVAL AND REVIVAL AS ALTERNATIVE EXPLANATIONS OF THE EMERGENCE OF THE MEDIEVAL ITALIAN CITY-STATES

DURING the post-Napoleonic decades of the nineteenth century of the Christian Era, when Italians who had been arbitrarily resubjected to an *ancien régime* were demanding their national unity and independence in the name of the French ideas of A.D. 1789, one of the forms in which this demand was expressed was a claim to the restoration of the constitutional liberties that had once been won and enjoyed by the Medieval Italian urban communes; and a feeling that the strength of this claim would be proportionate to the length of their ancestors' historical tenure of these allegedly prescriptive political rights moved a tendentious school of Romantic Italian historians, taking their cue from Savigny, the German historian of the renaissance of Roman Law in the West, to maintain that the communes which had begun to make their mark on the stage of Early Medieval Italian history in the eleventh century of the Christian Era were no new arrivals there and then, but were none other than the original city-states of a pre-Roman and Roman Italy which, on this hypothesis, had mutely survived the Hellenic Civilization's lapse into social anarchy in the third century of the same era, its subsequent last rally under the crushing aegis of a Diocletianic totalitarian régime, and its final dissolution in an interregnum preceding the emergence of a nascent Western Christian Hellenistic Society. According to this romantic thesis the 'ancient' Italian city-states had continued, through all these vicissitudes, to be going concerns. They had temporarily been 'off the record' without ever having lost their identity, and the epiphany of the Medieval communes in the eleventh century was not the 'ancient' city-states' rebirth, but merely their re-emergence.¹

Considering that a progressive decay of constitutional self-government is the dominant note of Hellenic political history throughout the span of more than six hundred years intervening between the generation of Philip of Macedon and the generation of Diocletian of Doclea, the burden of proof surely rests on the shoulders of the advocates of a thesis that the self-governing institutions of the Italian city-states resisted the elsewhere victorious forces of disintegration so successfully that they managed to survive even the final series of devastating catastrophes that gave the Hellenic Civilization its *coup de grâce*.² In this instance the *argumentum ex silentio* is one that decidedly requires an answer. Yet

¹ See Goetz, W.: *Sitzungsberichte der Bayerischen Akademie der Wissenschaften*, philologisch-historische Abteilung, Jahrgang 1944, Heft 1 (Munich 1944, Beck), pp. 5 and 105-6.

² This point is rightly emphasized by Goetz, *op. cit.*, pp. 108-9.

this argument remains unrefuted; and the formidable negative case against the thesis that the Medieval Italian communes were derived from the 'ancient' Italian city-states without any breach of historical continuity is confirmed by a positive consideration which would appear to be conclusive.

In the Medieval Italian communes the civic magistrates bore the title 'consuls'; and the advocates of the thesis that a Medieval Italian civic self-government goes back, without a break, to 'ancient' origins will be hard put to it to explain how and why and when the cities of Italy had come to adopt a piece of constitutional nomenclature which, in 'ancient' times, had been foreign to all of them with the sole exception of Rome. After Rome had made herself the queen of Italy and the rest of the Hellenic World through the prowess of Roman armies led by Roman consuls, no state-member of a Roman commonwealth of city-states would ever have ventured to call its municipal magistrates 'consuls' in lieu of the traditional local title, whatever this might happen to be. If the civic institutions of the Medieval Italian communes had really been handed down from days before the Roman conquest, then their supreme magistrates would still have borne the title *meddices tutici* in ex-Oscan-speaking communities and the title *praetores* or *dictator* in ex-Latin-speaking communities. If their institutions had been of Roman origin, then their magistrates would have been called *duumviri* or *quattuorviri*. If they had dated from the last century of the Principate they would have been called *curator*. If they had dated from the post-Diocletianic Age they would have been called *defensor civitatis*. But they could never have been given the Roman title 'consuls' until the official abolition of the Roman Consulate by the Emperor Justinian in A.D. 541¹ had become so immemorially old an accomplished fact that the term had had time to fade out of the field of practical politics into an academic limbo of historical memories. Then, and not till then, this term 'consul' would have come to be at the disposal of any academic-minded constitution-maker who might be attracted by it—and it would, of course, possess the supreme attraction of being associated historically with memories of the greatest age in the history of the most potent of all Hellenic city-states.

This tell-tale internal evidence inherent in the history of the title 'consuls' is confirmed by external evidence testifying that, in the parts of Italy conquered by the Lombards in and after A.D. 568, the last vestiges of civic self-government were effaced by new institutions for governing the cities through officers appointed by, and answerable to, the kings and dukes who ruled over the Lombard successor-states of the Constantinopolitan Roman Empire on Italian ground; and these new Lombard royal and ducal officials in Italian cities bore such new titles as 'counts', 'viscounts (*locopositi*)', *missi*, *gastaldi*, 'Schultheisse', *iudices*, *decani*. During the interval of four hundred years between the completion of the Lombard conquests and the rise of the Medieval Italian city-states, the surviving contemporary documents and other records show no trace of the currency either of the Medieval Italian title

¹ See V. vi. 111 and 224.

'consuls' or of any of the pre-Lombard titles of Italian civic magistracies dating from the Roman or pre-Roman Age.¹

This testimony borne by indisputable facts in the field of constitutional nomenclature tells conclusively in favour of the view that the communes which made their epiphany in Italy in the eleventh century of the Christian Era were walking ghosts of the 'ancient' Italian city-states and were not living survivals of them; for the use of the word 'consuls' to designate their magistrates shows that the eleventh-century Italian constitution-makers were playing at a resuscitation of 'ancient' republican institutions, consecrated in their tradition of the glories of 'Ancient Rome', with the same deliberate and selfconscious pedantry as was to be displayed, in their day, by the authors of the French constitution of the 25th December, 1799.

This vein of antiquarianism, which betrays the lack of any genuine continuity between the Medieval Western Italian city-states and the Late Hellenic city-states that had previously occupied some of the same sites on Italian ground, was not, of course, the creative source of the revival of a defunct Hellenic political institution in the life of a growing Western Civilization. Even in Italy the consciousness of a Roman past was exceedingly nebulous from the eighth to the thirteenth century of the Christian Era,² and these centuries included the period of gestation preceding the re-birth of the City-State in Italy. Down to the thirteenth century this successful Medieval Western revival of the Hellenic City-State was an unconscious, not a conscious, response to the challenge of new needs³ (in contrast to the abortive Medieval Western revival of the Roman Empire, which was selfconscious at every stage). The preponderance of the part played in this particular renaissance by the subconscious depths of the Psyche is indicated by the fact that Italy—where a gleam of selfconsciousness is registered in the coining of the antiquarian title 'consuls'—was only one of a number of localities in a Medieval Western Christendom in which the resuscitation of the Hellenic institution of the City-State occurred more or less simultaneously. This was a Pan-Hesperian movement in which Flanders, Germany, France, the Iberian Peninsula, and England were implicated, as well as Italy. The demands for greater security of person and property which evoked the first rudiments of Western civic self-government were rife in Transalpine Western Europe perhaps at least as early as in Italy.⁴ In presenting such demands, are we to suppose that 'the townsfolk of Northern France, Flanders, and Italy were taking their stand on Ancient Roman ideals? Is it not much more likely that the pressure of an emergency which was the same everywhere was the stimulus that evoked the same demands in all these places?'⁵ And, if it comes to that, are we to imagine that the Lombard *nobiles* of the Italian city of Savona and the likewise Lombard *arimanni* of the Italian city of Mantua, who obtained charters from the Margrave of Savona and

X. B (ii) (a), ANNEX II

POINTS OF LIKENESS AND DIFFERENCE BETWEEN THE RENAISSANCES OF THE SINIC AND HELLENIC UNIVERSAL STATES

A HAN EMPIRE that had served as the Sinic Society's universal state and a Roman Empire that had performed a corresponding service for the Hellenic Society were both alike eventually raised from the dead to minister to the needs of new societies that had sprung up among the Sinic and Hellenic worlds' ruins; and, in both cases alike, these feats of necromancy were performed after the derelict domain of the defunct society and its fallen universal state had been irradiated by a higher religion whose spark of creativity was of alien cultural origin, and had also been invaded by barbarian war-bands from a no-man's-land beyond the fallen universal state's *limes*. In both cases, again, the interloping barbarians consisted partly of local sedentary peoples and partly of Eurasian Nomads;¹ and, in both, the interloping higher religion was introduced by subjects of the declining universal state, and members of the disintegrating society's internal proletariat, who had this alien spiritual treasure to impart because they were the offspring of *ci-devant* members of another society—the Indic Society in the one case and the Syriac in the other—who had not renounced their pristine cultural allegiance when they had been incorporated into an alien oecumenical empire by military force. These points of likeness between the two episodes of history which we are here examining synoptically are so remarkable that they challenge us to search for the causes of the no less remarkable points of difference which the resemblances throw into sharp relief.

The most striking of these differences is also the one that was fraught with the most momentous historical consequences. The Han Empire found its avatar in a single polity—established by the Sui and consolidated by the T'ang—which was not only an intentional resuscitation of the defunct Sinic universal state but was also actually a genuine reincarnation of it, at least in a geographical sense, in virtue of the Sui Power's success in establishing its undisputed dominion over the entire area that had once been occupied by the Sinic Society and by a Han Empire under whose aegis the Sinic World had been united politically in the concluding chapter of Sinic history.² On the other hand the Roman Empire was resuscitated in two separate and mutually hostile avatars, either of which claimed to be the sole genuine reincarnation of the defunct Hellenic universal state and consequently found itself constrained to denounce its rival as an impostor.

These two competing ghosts of the Roman Empire were severally evoked in different fragments of former Roman territory at different

¹ The Eurasian Nomad barbarian invasion of a moribund Sinic World has been noticed in V. v. 272-3.

² See V. v. 356, n. 6.

dates. Leo Syrus established his East Roman Empire in Anatolia after foiling the Arabs' second attempt to capture Constantinople (*iterum obsidebatur* A.D. 717-18); the Carolingians established their Holy Roman Empire under the lee of the Roman Empire's former frontier along the Rhine in the course of the sixty-eight years that elapsed between Charles Martel's repulse of the Arabs at Tours in A.D. 732 and Charlemagne's coronation at Rome in A.D. 800. The Roman Empire was thus resuscitated as a split personality; and, even so, the aggregate area of the actual domains of the two rival *soi-disants* Roman Empires that made their successive appearances on the political map in the eighth century of the Christian Era did not cover, between them, anything like the entire area of the Roman Empire *imperante Hadriano* (A.D. 117-38) or even *imperante Diocletiano* (A.D. 284-305). The Arabs' conquest of the Visigothic successor-state of the Roman Empire in the Iberian Peninsula in A.D. 711-13 had completed the liberation of all provinces of the Syriac World that had ever been annexed to the Hellenic World by force of Macedonian and Roman arms; and the military reverses which the Arabs suffered thereafter in A.D. 717 and in A.D. 732 merely prevented them from engulfing a Hellenized Hittite World in Anatolia and the adjoining Greek and Italian homelands of the defunct Hellenic Civilization, without resulting in the re-establishment of even a simulacrum of Roman rule over the former Roman provinces south of the Taurus and of the Pyrenees.

Moreover, the two rival eighth-century avatars of the Roman Empire were insulated from one another overland by the effects of successive eruptions of Eurasian Nomadism out of the Great Western Bay of the Eurasian Steppe into the Balkan Peninsula; and, though the Avars on the Alföld were extirpated by Charlemagne in A.D. 791, this Austrasian 'Roman Emperor's' success in thus disposing of one intrusive Nomad horde was purchased at the price of enlarging the domain of another. Charlemagne found himself constrained to divide the territorial spoils of the Avars with the Bulgars, and the elimination of the Avars thus left the Bulgars astride the Middle as well as the Lower Danube, while it did not relieve the Balkan Peninsula of the presence of pagan Slav sedentary barbarians whom the Avars had parked there as their 'human cattle' when they were restocking a ranch that had been depopulated by the ravages of the Avars' Nomad forerunners, the Huns, and by the simultaneous drafts drawn on Illyrian military man-power by the Roman Emperor Justinian in pursuance of an anti-barbarian *revanche* that had defeated its own ultimate purposes.

This partition of two salvaged fragments of former Roman imperial territory between two rival ghosts of the defunct Hellenic universal state is a tale of comparative failure which gives the measure of the success achieved by the Sui and the T'ang in reuniting the whole former territory of a defunct Sinic universal state under the undivided rule of a single reincarnation of the Han Empire; and the historical consequences of this difference between the outcomes of these evocations of ghosts of a Sinic and an Hellenic universal state were truly momentous. The Sui and T'ang empire-builders' success in establishing

and maintaining a single oecumenical empire embracing the whole former domain of the extinct universal state of which this new empire was intended to be an avatar was a political achievement which ensured that the Sinic Civilization should be succeeded by a single undivided Far Eastern Society.¹ Conversely the Syrian and Carolingian dynasties' common failure to reincarnate a single unchallenged avatar of the Roman Empire was a political reverse which ensured that the Hellenic Civilization should be succeeded by one Christian Hellenistic Society in Anatolia and by another in the West.²

In the light of these portentous failures to re-establish either the political unity of the Roman Empire or the cultural unity of the Hellenic Society in the former geographical domain of the Hellenic World, the culturally fruitful political achievement of the Sui and T'ang Power stands out impressively; and this impression will be enhanced when we make a closer inspection of this great event's historical antecedents; since these will be found to forbid the assumption that, because this act of political reunification was successfully accomplished, it must therefore have been either a foregone conclusion or even an easy task.

By the time when the North and the South of a nascent Far Eastern World were united politically by the Sui Power in A.D. 589, the political separation between them had lasted, without a break, for no less than 272 years,³ and the previous political unity that had dissolved in A.D. 317 had been both ephemeral and unsubstantial. Even in name the oecumenical empire of 'the United Tsin' had existed for no more than thirty-seven years (A.D. 280-317); and the façade of political unity that had been erected by Sse-ma Yen (alias Wu-ti) in A.D. 280 and had been maintained by his successors during the 'United Tsin' Dynasty's brief régime had been purchased by them at the fatal price of losing hold, *de facto*, of the dynasty's own original patrimony in the North which had been their base of operations for this anachronistic reunification of the Sinic World a hundred years after the fall of the Posterior Han. This concentration of the military energies of one of the Han Empire's three indigenous successor-states on the fratricidal objective of suppressing the other two came as a godsend to Eurasian Nomad *laeti* who had been establishing themselves inside the Great Wall, by a process of more or less peaceful infiltration, ever since the first beginnings of the Han Power's decline; for this internecine Sinic civil war gave these barbarian interlopers their patiently awaited opportunity to shake off

¹ The eventual supplementation of the main body of this Far Eastern Society in China by a branch in Korea and Japan was the result of a subsequent process which was one, not of division, but of multiplication.

² Even after the differentiation between an Orthodox Christian and a Western Christian Hellenistic Civilization had declared itself in the generation of Leo Syrus and had accentuated itself in the generation of Charlemagne and had exacerbated itself in the generation of Photius (see I. i. 66-67), History's decree *nisi* need not, even then, necessarily have been made absolute—as it was made in fact in the generation of Michael Cerularius—to judge by the different denouement of another historical drama after it had arrived at the same dramatic situation. The differentiation between an Arab Muslim and an Iranian Muslim successor of a defunct Syriac Civilization was at least arrested, even if it was not permanently overcome, through the political union of five-sixths of the Arabic World with one-third of the Iranian World as a result of Ottoman conquests of Arabic territories in the sixteenth century of the Christian Era (see I. i. 388-400).

³ See V. v. 356, n. 6.

the control of the sedentary Power on whose domain they were trespassers.¹ When we have discounted an attempt to re-establish the Han Empire at the turn of the third and fourth centuries of the Christian Era which had such unfortunate consequences, we shall realize that, in effect, the political separation between North and South that was brought to an end by Sui Wên-ti in A.D. 589 had prevailed, by that date, not merely for 272 years, but for no less than four hundred years if we ignore the interlude of the United Tsin and carry our reckoning back to the date of the Posterior Han Dynasty's death agonies, which had set in before the close of the second century of the Christian Era. The feat performed by Yang Kien (alias Sui Wên-ti) in thus overcoming a political disunity, which, by his day, was entrenched in the accumulated inertia of four centuries of use and wont, was only surpassed by the succeeding T'ang Dynasty's feat of consolidating the unity of the long severed northern and southern halves of the Far Eastern World which the Sui had so dexterously joined together.²

Both the Sui and the T'ang were heirs of the Eurasian Nomad barbarian successor-states of the Han Empire³ which had overtly asserted their independence in the hinterland of the Great Wall at the beginning of the fourth century of the Christian Era after the fiasco of the ostensible political reunification of the Sinic World under the United Tsin; and, if we bear in mind this barbarian heritage of the dynasties responsible for the renaissance of the Sinic universal state in the history of the subsequent Far Eastern Civilization in its original political shape of a single oecumenical empire embracing the entire domain of the former Sinic Society, we shall be able to discern what the corresponding course of events would have been in the aftermath of the histories of the Hellenic Civilization and of a Roman Empire that had played the part of an Hellenic universal state.

To reconstruct a corresponding denouement here, we should not only have to imagine Charlemagne emulating, as he did, the achievement of the Sui's predecessors the Pe Chôu, who had provided the Sui with their base of operations for uniting the South of the Far Eastern World with the North in A.D. 589 by having already reunited a previously partitioned North in A.D. 577; we should have to imagine Charlemagne, after his reunion of the Roman Empire's Lombard successor-state with its Frankish successor-state in A.D. 772-4, being supplanted by a usurper of native Gallo-Roman descent who then went on—by conquest or marriage or diplomacy—to reunite the contem-

¹ See V. v. 272-3. In thus purchasing a transitory political reunification of the South with the North of the Sinic World at the cost of opening the door for barbarian usurpers to make themselves masters of an archaistically ambitious Imperial Power's home territories, the United Tsin were making the same mistake that Justinian was to make when he purchased for the Roman Empire a transitory reconquest of Italy at the cost of losing the Balkan Peninsula to the Avars and their droves of Slavs (see V. vi. 286), and that Michael Palaiologhous was to make when he purchased for the East Roman Empire's Nicaean Greek Orthodox Christian successor-state a burdensome re-occupation of Constantinople at the cost of losing Western Anatolia to Turkish Muslim war-bands set in motion by the dissolution of the Saljûq Sultanate of Qöniyeh.

² Matt. xix. 6.

³ These barbarian antecedents of theirs are underlined by Franke, O.: *Geschichte des Chinesischen Reiches*, vol. ii (Berlin and Leipzig 1936, de Gruyter), p. 250. On this point, see also the present Study, V. v. 273, 356, n. 6, and 477-8.

porary East Roman reincarnation of the Roman Empire in Anatolia and Constantinople with Charlemagne's reincarnation of the Roman Empire in Gaul and Italy. But, to make our imaginary correspondence of post-Roman history with post-Han history complete, we must also endow the eighth-century East Roman Empire, which we are imagining Charlemagne's hypothetical Gallo-Roman supplanter to have annexed, with a vastly wider dominion than the modest combination of an Anatolian citadel with a Constantinopolitan bridgehead that had actually been inherited by Charlemagne's contemporaries Constantine VI and his mother Irene from their predecessor Leo Syrus. We must imagine the East Roman Empire of Charlemagne's day to have been coextensive with the Roman Empire within the frontiers that had been recovered for it by Justinian, and we must imagine Justinian to have succeeded completely in attaining his objective of reconquering the Roman Empire's Visigothic, as well as its Ostrogothic and Vandal, successor-state. This series of imaginary successes would have to be substituted for so many historical failures in the political history of a post-Hellenic interregnum in order to credit Charlemagne's hypothetical supplanter with an imaginary achievement of the same order of magnitude as the actual performance of the Chinese empire-builder Sui Wên-ti; and, even then, we should find that we had not succeeded in bringing Charlemagne's imaginary Gallo-Roman heir completely into line with his mighty Far Eastern counterpart; for the combination of actually unachieved successes which we have placed to the credit of Charlemagne's imaginary heir still leaves the English successor-states of the Roman Empire in Britain beyond our preposterously exaggerated imaginary limits of the Holy Roman Empire, whereas the whole former domain of the Han Empire was duly reassembled in the realm that Sui Wên-ti actually brought into being.

The residual discrepancy resulting from the recalcitrant independence of Mercia and the other barbarian successor-states of the Roman Empire in Britain might perhaps be glozed over, but we must not flatter ourselves by supposing that, if we were to ignore this minor point, we should find ourselves at the end of our imaginary rewriting of post-Roman history if we were seriously intent on bringing it into line with the post-Han history of the Far East; for an avatar of the Han Empire that had been integrally reconstructed by Sui Wên-ti was preserved all but intact for the next 553 years (A.D. 589-1142) under successive Sui, T'ang, and Sung régimes,¹ whereas Charlemagne's diadochi and epigoni actually proved incompetent to hold together even the fraction of the Roman Empire's former domain that Charlemagne had managed to reassemble. To bring the course of Far Eastern history into conformity with the course of Western history, we must imagine the year A.D. 589

¹ A stricter count would limit the duration of the Far Eastern avatar of a Sinic universal state to a span of some three hundred years, since the main body of the Far Eastern World went through a spell of political disruption between the onset of the T'ang Dynasty's death-agonies in the last quarter of the ninth century of the Christian Era (see IV. iv. 86 and 87-88) and the establishment of the Sung Dynasty in A.D. 960 (see V. vi. 306); and during this bout of anarchy sixteen border districts were ceded, between the years A.D. 927 and 937, to the Khitan transfrontier barbarians (see II. ii. 121; IV. iv. 86; V. v. 308; and V. vi. 307).

witnessing in the Far East, not the consummation of the Pe Chóu Dynasty's reunification of the North in A.D. 577 through Sui Wên-ti's unification of North and South, but the undoing of the local achievement of A.D. 577 in the North through a relapse of the North into the state of political disintegration in which it had been languishing before A.D. 577 since the break-up, in A.D. 534, of the 'Wei' empire in which the North had been reunited *circa* A.D. 410/439¹ as a result of the To Pa Eurasian Nomad barbarian principality's success in progressively swallowing up all the other barbarian successor-states of the Han Empire which had come to the surface in the North since the beginning of the fourth century.²

If we may assume that we have now taken the full measure of the difference between the respective courses of post-Han history and post-Roman history that has to be taken into account in order to see the equally evident points of likeness between the same two stories in their true perspective, we may now go on to inquire into the causes of this partial diversity of two lines of development that are at the same time partially similar. We shall find ourselves able to identify one geographical cause and one political.

The geographical cause is to be found in a physiographical difference between the Sinic and the Hellenic World which is reflected in the respective structures of the Han and the Roman Empire.

The Sinic Civilization³ was a continental culture, and its geographical expansion was carried out overland up to 'the natural frontiers' of an East Asian sub-continent which was delimited by the southern shore of the Eurasian Steppe, the western shore of the Pacific Ocean, and the eastern escarpment of the Tibetan Plateau almost as definitely as the Indian sub-continent was delimited by the southern escarpment of the Tibetan Plateau, the eastern escarpment of the Iranian Plateau, and the northern shores of the Indian Ocean. In the expansion of the Sinic Civilization, the extirpation or assimilation of the sedentary barbarian highlanders previously inhabiting the northern fringes of the latter-day provinces of Shensi and Shansi had brought the Sinic World into immediate contact with the Eurasian Nomad World; and the risk of being invaded by the Nomads, to which the Sinic Society had thereby laid itself open, was not effectively parried by the expedient of reinforcing a 'natural' frontier in this quarter by the construction of those artificial fortifications that were eventually consolidated by Ts'in She Hwang-ti into one continuous Great Wall.⁴ Yet, though this rather wantonly incurred peril from a seething pot towards the North⁵ was not counteracted by these immense anti-Nomad defensive works, it was discounted, as the sequel was to show, by a vast overland extension of the Sinic Society's domain in another direction. A progressive subjugation of the sedentary barbarians beyond the south-western fringes of the Sinic World of the third century B.C. was initiated by Ts'in She Hwangti and was carried to completion rather more than a hundred

years later by the Ts'in emperor's Han successors when they eventually pushed their advancing frontier over the crest of the Yangtse Basin's southern watershed down to the 'natural' frontier presented by the East Asian sub-continent's southern coast;¹ and this rounding-off of the Sinic universal state's domain towards the south-west, which was achieved by the Emperor Han Wuti in 111 B.C., was to prove its value four hundred years later, when in A.D. 311 the burst of a long-lowering Eurasian Nomad storm-cloud was proclaimed in the sack of 'the United Ts'in's' historic capital, Loyang, by the Hiongnu founders of a barbarian successor-state which they sought to dignify with the name 'Pe Han'.²

This catastrophe of A.D. 311 gave a then senile Sinic Society a shock which was perhaps even more severe than the shock given to it by the previous sack of Loyang in A.D. 191, which had announced the beginning of the Posterior Han Dynasty's death-agonies; for in A.D. 191 the outrage had at least been committed by native Sinic hands, whereas the sacrilege of A.D. 311 was the deed of barely disguised *ci-devant* barbarians. The sack of Loyang in A.D. 191 had been followed in A.D. 221 by the dissolution of the Han Empire into the three indigenous successor-states, known as 'the Three Kingdoms', which had partitioned the Sinic World between them until its transitory political reunification under the United Ts'in. The more appalling repetition of the catastrophe in A.D. 311 did not, however, sound the death-knell of the so-called 'Ts'in'. Though they had now lost to the Nomad barbarian interlopers their own original territory in the upper and lower basins of the Yellow River, which had been the Sinic Civilization's original cradle before becoming the metropolitan territory of its universal state, the 'Ts'in' were still masters of the Yangtse Basin and the Southern Seaboard, thanks to their completion of the reunification of the partitioned domain of the Han in A.D. 280.³ In A.D. 318 the 'Ts'in' turned to account their still unchallenged possession of this vast reserve of territory in the South by re-establishing their government in a new capital in the Lower Yangtse Basin in the city that eventually came to be known as Nanking.

By this politic migration the Ts'in succeeded in prolonging the period of their rule for another century;⁴ and, when they fell at last in A.D. 420,

¹ See V. v. 141-2 and 147.

² i.e. 'Northern Han'.

³ In A.D. 280 the Ts'in had annexed the Kingdom of Wu, which had held the Middle and Lower Yangtse Basin and the Southern Seaboard. The Kingdom of Shu, which had held the Upper Yangtse Basin (the latter-day province of Szechwan), had been annexed by the Northern Kingdom of Wei in A.D. 263, two years before the replacement of this Wei Dynasty by the Ts'in Dynasty in the North in A.D. 265.

⁴ This migration would not have achieved the political success that it did achieve if it had not had its economic counterpart in the effective development of the agricultural potentialities of the refugee régime's Southern fastness.

'The unity of China under the Western Ts'in Dynasty (A.D. 265-317), which succeeded the Three Kingdoms, did not last long. Less than fifty years after its inauguration, the Ts'in emperors had to retire to the south of the Yangtse River in the face of victorious rebellions on the part of the peasants in the northern provinces, who were in some districts the descendants of "barbarians" from what is now Chinese Turkistan and Mongolia, who had settled south of the Great Wall several centuries before. This period marks the change from "Western" Ts'in to "Eastern" Ts'in (A.D. 317-420). . . . The transition from "Western" to "Eastern" Ts'in and subsequent events in the interval before China was unified again under the Sui Dynasty in A.D. 589 involved a tremendous

the Southern Empire which they had established did not fall with them, but passed intact to succeeding dynasties known as the Sung (*imperabant* A.D. 420-79), Ts'i (*imperabant* A.D. 479-501), and Liang (*imperabant* A.D. 502-55). It was not till A.D. 555, 244 years after the sack of Loyang by the Hiongnu in A.D. 311, that any part of the South came under the rule of a northern state of Eurasian Nomad barbarian origin. In A.D. 555¹ the Liang Empire's capital, Kiangling, on the Middle Yangtse, was captured by the armies of the 'Western Wei' fraction of the To Pa Northern Empire; but the consequent break-up of a Southern Empire, which, by that time, had been a going concern for an unbroken period of little less than a quarter of a millennium, resulted at the moment in only a partial southward extension of northern barbarian rule. In A.D. 555 the middle and upper basins of the Yangtse were duly annexed by the 'Western Wei', to pass thereafter from the 'Western Wei's' To Pa hands into the 'Pe Chóu's' Hiongnu hands² in A.D. 557,³ and from the Pe Chóu's barbarian hands into the Sui's Chinese hands⁴ in A.D. 581; but, in the Lower Yangtse Valley and on the Southern Sea-board, an attenuated Southern Empire survived under the Ch'en Dynasty (*imperabant* A.D. 557⁵-89) until the extinction of the Ch'en by the Sui in A.D. 589 at last reunited the whole former domain of the Han Empire under the rule of an oecumenical Power incubated in the North.

If we ask ourselves why this conquest of the South by heirs of the Eurasian Nomad conquerors of the North was so long delayed, the first answer is that the Prior Han Dynasty, in rounding off their domain towards the south-west, had created a 'Solid South' which was to prove impregnable to Nomad assaults.⁶ In contrast to a long-since dry and open North, in which Man had won his victory over Water⁷ as early as the Shang Age, even a latterly likewise tamed and regulated Yangtse Basin still presented a network of waterways to hamper the advance of the Nomad cavalry; and, if some enterprising squadrons were to suc-

change in the socio-economic history of the nation. The risings of "barbarian" settlers, who were mostly serfs working on land owned by Chinese "mandarin" lords, as well as the rebellions of discontented Chinese peasants, drove a vast number of Chinese of the upper classes, as well as retinues of their supporters, to the south of the Yangtse River. When the "barbarian" dynasties set up in their northern homes had lasted over a generation, hopes of regaining the northern domain were practically given up in the latter years of the Eastern Tsin, and the Chinese refugees in the Lower Yangtse Valley prepared for a permanent stay. . . . Such an impetus and necessity for migration had hitherto never been so keenly felt in the history of the Chinese people. The result . . . was the beginning of a period of rapid development of the fertile Yangtse Valley, which ultimately made it the Key Economic Area in China, replacing the Ching-Wei Basin and Lower Yellow River Valley. This brought about a sharp transformation of Chinese culture' (Chi, Ch'ao-ting: *Key Economic Areas in Chinese History as Revealed in the Development of Public Works for Water-Control* (London 1936, Allen & Unwin), pp. 107-8 and 110).

¹ This is the date given by Franke, O.: *Geschichte des Chinesischen Reiches*, vol. ii (Berlin and Leipzig 1936, de Gruyter), p. 175. In op. cit., vol. cit., p. 229, however, the same scholar dates the same event as having happened before the close of the year A.D. 554.

² For the Hun origin of Yü-wên T'ai, the barbarian mayor of the *ci-devant* barbarian Western Wei Dynasty's palace who laid the foundations of the parvenu Power that subsequently took the name 'Pe Chóu', see Franke, op. cit., vol. cit., pp. 226-7.

⁶ This point has been noticed already in VI. vii. 357, n. 4.

⁷ See II. i. 318-21.

ceed in threading their southward way through this watery maze and floundering out again without having been bogged, they would then straightway find themselves confronted with a broad belt of forest-clad highlands over which they would have to force a passage if they were bent on descending upon their Sinic victims' last ditch on the South China Coast. The strength of this Sinic 'Festung Südland' was demonstrated in A.D. 383, when a supreme effort to conquer the refugee 'Tsin' Dynasty's Southern Empire was made by a northern barbarian empire-builder of Tibetan origin, 'Ts'in' Fu Kien (*imperabat* A.D. 350-85),¹ who had momentarily united under his own rule all the barbarian successor-states of the former 'United Tsin' Empire in the North. This barbarian invasion of the South in A.D. 383 met with a crushing disaster before it had penetrated beyond the basin of the River Huai;² and the barbarian rulers of the North learnt this lesson so well that, as we have seen, the indigenous Southern Empire survived thereafter for 172 years (A.D. 383-555) intact, and for 206 years (A.D. 383-589) in an attenuated form, till it was eventually united with the North by a Northern Power with barbarian antecedents in whose ethos a hereditary barbarism had been winnowed out, by the date of the Sui Dynasty's accession to power in A.D. 581, through the persistent counter-influence of a still radioactive Sinic culture that had been playing upon the barbarian interlopers in the North for no less than four hundred years by the date of the Sui's conquest of the Ch'en.

Thus the continental physiography of the Sinic World enabled Han empire-builders to provide the Sinic culture with a natural fortress in the South which proved impregnable to the Eurasian Nomad barbarian conquerors of the North. In contrast to the physical structure of the Sinic World, the physiography of the Hellenic World was not continental but maritime, and the corresponding structure of the Roman Empire partly accounts for the Hellenic universal state's relative ill-success in foiling its barbarian invaders.

Whereas the Sinic Civilization had spread from river basin to river basin—originating in the Basin of the Yellow River and expanding into the Basin of the Yangtse—the Hellenic Civilization had spread from the shores of a lesser inland sea round the circumference of a greater one. It had come to birth between the Asiatic and European shores of the Aegean;³ and in the penultimate phase of its decline⁴ it had been unified politically by Roman empire-builders within the framework of a 'thalassocracy' commanding the entire perimeter of the Mediter-

¹ See Franke, O.: *Geschichte des Chinesischen Reiches*, vol. ii (Berlin and Leipzig 1936, de Gruyter), pp. 80-101.

² See *ibid.*, pp. 95-97. The date of this decisive battle, which was fought in the angle between the Huai and its tributary the Fei, is given as A.D. 387, not 383, by C. P. Fitzgerald in *China, A Short Cultural History* (London 1935, Cresset Press), p. 257.

³ See IX. viii. 711-12.

⁴ The first attempt to provide the Hellenic World with a universal state had been made within the confines of Hellenism's Aegean cradle; but by the year 478 B.C., which saw the establishment of this abortive Athenian 'thalassocracy', the Hellenic World had already expanded far beyond these original limits; and, when, in 415 B.C., the Athenians sought to make their 'thalassocracy' coextensive with the contemporary domain of Hellenism by attempting to conquer Sicily, this enterprise proved to be so much beyond their strength that it led them into a disaster which was ultimately fatal to their 'thalassocracy' even within its more modest previous Aegean bounds.

reanean.¹ Though Roman roads and Roman legions left a deeper impression on the mind of Posterity than Roman shipping-lanes and naval patrols, the Roman Empire was in truth a pool of water surrounded by a hollow ring of land,² in contrast to the structure of the Han Empire, which was a plain of ploughland flanked on one side by a moated highland citadel.³

When we compare this maritime structure of the Roman Empire with the continental structure of the Han Empire, we can see that the Pan-Hellenic 'thalassocracy' had two politico-geographical weaknesses from which the Pan-Sinic terrene empire was exempt.

In the first place a Power that ruled the shores of the Mediterranean in virtue of ruling its waves could not extend its rule inland in any direction very far beyond the range of action of naval landing-parties, and therefore, in most directions, was constrained to draw the line of its *limes* along an alinement that fell far short of the nearest 'natural frontier'. The halo of impregnability with which the semi-official panegyrist of the Roman Empire sought to crown its landward defences during its illusory 'Indian Summer'⁴ was rudely dissipated by the historical sequel; and the Emperor Hadrian had already seen through it as early as the year A.D. 117, when the death of a frustrated Roman Alexander had given this Roman Antipater his chance of liquidating a Trajanic adventure by reverting to a sober Augustan policy of territorial retrenchment. The Romans failed to find either a natural frontier or a satisfactory artificial substitute, not only in the South-West Asian hinterland of the Mediterranean,⁵ but in its European hinterland as well.⁶ The only two natural frontiers that they did succeed in reaching were the First Cataract in the Nile Valley—where they had merely to take over a line that an Augustan-minded Pharaoh, Psammetichus I, had laid down for them⁷ more than six hundred years before Augustus's own occupation of Psammetichan Egypt after the Battle of Actium—and the Atlantic coast of Continental Europe between the Straits of Gibraltar and the Delta of the Rhine; but the Roman hold on this Continental European natural frontier was never confirmed by an integral occupation of its natural outworks in the British Isles. Though Claudius and his successors realized that the occupation of Britain was a necessary complement to that of Gaul, Lower Germany, and the north-west corner of the Iberian Peninsula, they were never willing to face the truth that, so long as their occupation of Britain stopped short at the line of the Solway and the Tyne, or even at the line of the Clyde and the Forth, without going on to embrace Caledonia and Ireland, they were condemning themselves to an increase in their military liabilities instead of securing a diminution of them.

The Romans' failure to round off their conquest of Britain by pushing

¹ See VI. vii. 216-17.

² See VI. vii. 217.

³ The plain—consisting of the Wei Basin 'within the Passes' and the Lower Yellow River Basin to the east of that mountain barrier—corresponded physiographically to the western and eastern basins of the Mediterranean in the structure of the Roman Empire. The 'Festung Südländ', perched on the southern watershed of the Yangtse Basin behind a network of waterways, corresponded to the Roman dominions in North-West Africa.

⁴ See the panegyrics cited in VI. vii. 43-44 and 45-46.

⁵ See IX. viii. 411-13.

⁶ See V. v. 591-5.

⁷ See II. ii. 116.

on to the natural frontiers that here lay close within their reach was more significant, and more ominous, than their failure to find a satisfactory frontier in the great open spaces of Continental Northern Europe and South-West Asia. Their performance in Britain argued an inability or unwillingness to mobilize even a limited additional quantum of energy or resources or both when this quantum amounted to no more than an inconsiderable fraction of Rome's total latent strength, and when a temporary exertion of this marginal effort promised to bring her a permanent relief from strain. The weakness that the Romans thus exhibited in Britain was also displayed by them in North-West Africa; and their failure here is particularly pertinent to our present inquiry because, as has been pointed out,¹ North-West Africa corresponded, in the geographical structure of the Roman Empire, to that southern hinterland of the Sinic World in which a Sinic universal state at bay eventually found 'a natural citadel' thanks to the successful exploitation of this region's politico-geographical potentialities by the conscientiously thorough-going labours of Prior Han empire-builders.

In terms of human geography North-West Africa was an island; for, wherever its coasts were not laved by the waters of the Mediterranean Sea and the Atlantic Ocean, they were brushed by the sands of the Sahara; and this desert, as the Romans had found it, had been a more effective insulator than the conductive waters of the Western Mediterranean, since the Sahara remained recalcitrant even to the steppe-conquering technique of the Afrasian Nomads until the Romans themselves placed a Sahara-conquering weapon in their Afrasian Nomad barbarian adversaries' hands by introducing the camel into North-West Africa from Arabia.² The conquest of the Sahara by indigenous North-West African Zanāta Berber Nomads,³ who had learnt the use of the camel from Nafūsa and Lawāta Berber Nomad immigrants from Tripolitania,⁴ was not, however, consummated before the overthrow of the Roman régime in North-West Africa in A.D. 429-39 by the co-operation of an intrusive barbarian war-band, composed of Alan Eurasian Nomads and semi-nomadized Vandals, with indigenous barbarian war-bands recruited from the never subjugated sedentary barbarian North-West African highlanders. This long-delayed but, in the event, irresistibly overwhelming assault on Roman North-West Africa by the combined forces of convergent barbarian aggressors was the penalty of the Romans' failure to exploit the Maghrib's potentialities as 'a natural fastness' by subjugating the Berber highlanders up to 'the natural frontier' offered to Rome by the dry shore of a then still untenanted Sahara.⁵ The Romans' sole achievement in this field was a precarious pacification of the isolated massif of the Aurès; but they did not ever effectively occupy more than the eastern half of the Algerian Tall, and, *a fortiori*, they hardly touched the Moroccan Rif and never took even a first step towards subduing the Atlas.

This Roman record in North-West Africa was a very different story

¹ See p. 658, n. 3, above.

² See Gautier, E. F.: *Les Siècles Obscurs du Maghreb* (Paris 1927, Payot), pp. 162, 184, and 199-200.

⁴ See *ibid.*, pp. 209-10.

³ See *ibid.*, pp. 197-8.

⁵ This failure has been noticed in V. v. 205.

from the Han Empire's record in South China; for, though, in this case likewise, the subjugation of the local sedentary barbarian highlanders was by no means complete, it went sufficiently far to rule out all possibility of dangerous combinations between unsubdued southern barbarian highlanders and invading northern barbarian Nomads in the crisis in which the strength of the Sinic World's southern citadel was put to the test in the fourth century of the Christian Era, whereas, in Roman North-West Africa, a local eruption of unsubdued barbarian highlanders had been one of the regular incidents in each of the successive paroxysms of simultaneous concentric barbarian attacks on the perimeter of the Roman Empire's hollow ring. The *Bellum Gildonicum* had broken out in A.D. 398, thirty-one years before Genseric's passage into North-West Africa from the European shore of the Straits of Gibraltar; and in the previous paroxysm in the third century of the Christian Era there had been a similar outbreak of dissident local Berbers taking up arms on their own initiative.¹

Another politico-geographical weakness of the Roman Empire was that, if once an aggressive external enemy had succeeded in breaking through its inevitably long-drawn-out and ill-sited artificial frontier defences, the Roman armies found themselves hampered by the narrowness of their manœuvring room in their attempts to foil the invader by a strategy of defence in depth² which proved the salvation of the Han Power's feeble 'Tsin' epigoni in A.D. 383.³ When once an assailant had broken through the Roman *limes*, the odds would be heavily against the Roman defence force in its subsequent efforts to prevent the invader from reaching the coast; for the whole terrene perimeter of the Roman Empire was so thin—even in those Gallic and Anatolian sectors which were of twice the tenuous standard thickness⁴—that any breach of the *limes* would bring the Mediterranean within the invader's range; and, when once he had debouched on its shores, the conductivity of this central pool of politically neutral navigable water would give any pawn that launched a keel on it the range and versatility of a queen, and would offer these facilities for a sudden vast increase in mobility to Gothic, Vandal, or Arab piratical craft with the same indiscriminating hospitality that it had shown to Roman warships and to Alexandrian merchantmen. The maritime physiography of the Hellenic World thus militated against a latter-day Roman Empire at bay⁵ as powerfully as it had once told in favour of Roman empire-builders who had made Rome's imperial fortune when their audacity in taking to an element on which their Carthaginian adversaries had previously reigned supreme had justified itself by its success in breaking through a sea-borne Punic 'wooden curtain'.⁶

These weaknesses in the structure of the Roman Empire proved, in the event, to outweigh, in combination, one fortuitous advantage over the Han Empire which the Roman Empire enjoyed thanks to an accident

¹ See V. v. 219.

² The Diocletianic Restoration's substitution of a system of defence in depth for a broken cordon along the *limes* has been noticed in VI. vii. 322-3.

³ See p. 655, above.

⁵ See VI. vii. 93.

⁴ See VI. vii. 217.

⁶ See IX. viii. 428-9.

of physical geography. We have seen that the Han Empire was exposed at point-blank range to the blast of Eurasian Nomad explosion along the enormous length of a Great Wall whose masonry was all that stood between the nucleus of the Sinic universal state in the Yellow River Basin and the huge reservoir of Nomad energy in and beyond Gobi. By contrast, the Roman Empire was nowhere in immediate contact with the Eurasian Steppe except at the tip of the Steppe's Great Western Bay where the Iron Gates barred the way farther westward into the isolated enclave of steppe-land in the Hungarian Alföld.¹ Yet one band of Alan Eurasian Nomads, whose point of departure was this far-flung western outpost of their native Eurasia, capped their initial feat of breaking through the Continental European *limes* of the Roman Empire by making their way, not only overland into the south-western extremity of the Continent, but on across the waters of the Western Mediterranean into the Romans' North-West African island, in the train of the Vandal war-lord Genseric. And, after thus making their sea-passage without mishap in A.D. 429, these outlandish invaders from beyond the extreme opposite sector of the vast Roman perimeter brought their long trek to a triumphant termination by entering Carthage itself within ten years of their audacious landing on African ground.

This brilliant success of Vandal-led Alan Nomads at the Roman Empire's expense in North-West Africa in A.D. 429-39 throws into piquant relief the blackness of the disaster that overtook the Tibetan-led Hiongnu and Sienpi Nomad assailants of the Sinic World's moated southern fortress at the very first ditch that these ill-starred barbarian aggressors tried to cross. The water-jump in the Huai Basin was the outermost of all the Sinic southern fortress's defences. How was it that the regulated waterways of a Far Eastern river-basin availed in A.D. 383 to foil the Nomad cavalry who, at the opposite end of the Old World only forty-six years later, were to commit themselves with impunity to the less familiar waters of 'the salt estranging sea' when they ventured to take ship from Europe to Africa in A.D. 429?

These versatile Alano-Vandal 'horse-marines' did not merely escape mishap in making a single sea-passage from Europe to Africa; when once they had taken to the sea they immediately made themselves so much at home on this previously unfamiliar element that, from a newly conquered North-West African base of operations, they succeeded in wresting back out of Roman hands the naval command of the Western Mediterranean which the Romans had wrested out of Carthaginian hands seven hundred years back, in the First Punic War (*gerebatur* 264-241 B.C.). How was it that the Alano-Vandals were able to master the sea when the Hunno-Tibetans had been worsted by a river?

The surprising answer to this irrepressible question seems to be that the art of marine navigation was less difficult for these centaurs to acquire than the steeple-chaser's knack of leaping clear from bank to bank of a fresh-water ditch. The Eurasian Nomad's strange inability to cope with inland waterways was indeed eventually to prove his undoing

¹ See III. iii. 401-2.

when this fatal flaw in his efficiency was discovered and exploited by the Cossacks;¹ and the rare amphibious prowess of 'Water Sakas', who turned to account on the Indus a fluvial waterman's skill that they had acquired on the Oxus,² was manifestly one of those exceptions that prove a rule. If this reading of the historical evidence is correct, it requires us to discard, as a misleading illusion, the visual impression produced by a synoptic view of the physiographical maps of the Han Empire and the Roman Empire when we place these two pictures side by side. If, in ignorance of the historical facts, we were to ask ourselves which of these two strikingly diverse physiographical structures might be expected to offer the greater facilities to mounted invaders, the obvious *a priori* answer would be that a continental empire built round the basins of two rivers with a common watershed would be as easy for an invading cavalry to overrun as it would be difficult for these horsemen to conquer the transmarine provinces of a maritime empire built round the basins of two interconnecting bays of one continuous inland sea. Yet this *a priori* answer is given the lie by the historical fact that the Alano-Vandals brilliantly succeeded in conquering a transmarine North-West Africa in A.D. 429-39, whereas the Hunno-Tibetans were ignominiously repulsed in A.D. 383 on the banks of the River Huai.

The outcome of the contest between an Alano-Vandal attack and a Roman defence in North-West Africa in the fourth decade of the fifth century of the Christian Era was decided, as we have already observed, by the cumulative effect of one feature of the Roman Empire's physiographical structure and one politico-military legacy of an antecedent chapter of Roman imperial history. The Alano-Vandals were sped on their way from Central Europe to North-West Africa by the conductivity of the invaded oecumenical empire's central sea; but their subsequent conquest of Rome's North-West African dominions would certainly not have been completed so quickly, and might perhaps never have been completed at all, if, in the course of the 575 years that had elapsed, by the date of the Alano-Vandal landing in Africa in A.D. 429, since Rome's first annexation of territory in Africa in 146 B.C., the Romans had emulated the thoroughness of the Prior Han empire-builders' work in Southern China by effectively subjugating all the North-West African highlands up to the natural frontiers afforded by this virtual island's Saharan desert coasts. The conjuncture that ensured the rapid and complete extinction of Roman rule in North-West Africa after the advent of the Alano-Vandals in A.D. 429 was the survival of a still unsubjugated local barbarian enemy at the gates, ready to join hands with the exotic Eurasian barbarian new arrivals. The alliance between the interloping horsemen and the indigenous highlanders was as decisive as it was inevitable.

Thus Rome failed to furnish a senile Hellenic World with a defensible fortress in a North-West Africa which, in the physiographical structure of the Roman Empire, was the morphological counterpart of the New South in the structure of the Han Empire. On the other hand, Rome did succeed in creating an imperfect, yet locally effective, functional

¹ See II. ii. 154-7 and V. v. 283 and 313-15.

² See V. v. 603.

counterpart of the Sinic World's never violated southern fortress in an Anatolia¹ which had no morphological affinity at all with the Sinic World's latter-day southern extension, though it had a partial affinity on this physiographical plane with the Sinic World's original nucleus in the North.

Both the extent and the limits of this physiographical correspondence between Anatolia and Northern China come to light when we remind ourselves that the chain of mountain-girt fluvial plains, extending from the Wei Basin on the west to the Lower Yellow River Basin on the east, had played, in the genesis and growth of the Sinic Civilization, the part played in the genesis and growth of the Hellenic Civilization by a chain of landlocked seas extending from the Aegean on the south to the Sea of Azov on the north.² The Aegean reach of this saline inland waterway had been the original home of a maritime Hellenic Society which had come to birth between the Aegean's Asiatic and European shores; and the Asiatic half of the birthplace of Hellenism—which was to figure on a pre-Diocletianic Roman imperial administrative map as the province of 'Asia'—occupied the western extremity of the Anatolian Peninsula up to the western fringes of the Central Steppe. Thus the Anatolian citadel of a post-Diocletianic Roman Empire included the Asiatic half of the Hellenic World's original nucleus; but, on the other hand, it did not include the European half of this homeland of Hellenism, while it did include a Central and an Eastern Anatolia which, so far from having been parts of the Hellenic Civilization's original patrimony, had been the homelands of a Hittite Civilization which had neither been annexed to the Hellenic Society's political domain nor exposed to an intensive play of Hellenic cultural radiation until after the overthrow of the Achaemenian Empire by Alexander the Great. The Anatolian citadel of the Roman Empire was thus composed of one-half of the original homeland of Hellenism in combination with the whole of the original homeland of the Hittite Civilization; and we have already noticed in previous contexts³ that, in the eventual structures of both a Hellenistic Orthodox Christian World and an East Roman avatar of the Roman Empire, the centre of gravity came to rest in a *ci-devant* Hittite Central and Eastern Anatolia that were occupied by the East Roman Empire's Anatolic and Armeniac army corps districts, and not in a *ci-devant* Hellenic Western Anatolia, where a Thracensian army corps district occupied the area once covered by the Roman province of Asia.

In Late Roman Imperial history an Anatolia whose cultural heritage was thus partly Hellenic but predominantly Hittite was the scene of decisive events corresponding on the politico-military plane to the historic defeat in A.D. 383 of the Hunno-Tibetan barbarian assailants of the Sinic southern fortress; and the salvaging of Anatolia in the fifth century of the Christian Era was as signal an achievement of contemporary Roman imperial statesmanship as the loss of North-West Africa was a nemesis of local Roman sins of omission in the past.

¹ See VI. vii. 357, n. 4.

³ In II. ii. 79-80 and IV. iv. 342.

² See IX. viii. 711-12.

By the end of the fourth century, Roman rule in Anatolia was already in jeopardy from a local juxtaposition of those two varieties of Barbarism that were to provide the ingredients for so explosive a mixture in North-West Africa twenty-nine years later. The never subjugated Berber highlanders had their fourth-century Anatolian indigenous barbarian counterparts in Isaurian highlanders who had shaken off a precariously established Roman control,¹ while counterparts of the future Alano-Vandal conquerors of North-West Africa, in the shape of Alano-Gothic *laeti*, had been imported into Anatolia already by the deliberate action of the Roman imperial authorities themselves. Yet, in the event, this ominous situation in Anatolia was saved by a Constantinopolitan Imperial Government's success in forestalling Gainas the Goth's plotted *coup* in A.D. 400 and Aspar the Alan's plotted *coup* in A.D. 471; the Gothic *laeti* in Anatolia were extirpated before it had occurred, either to these imported carnivores or to the native Isaurian representatives of the breed, that the wolf and the jackal in partnership would have it in their power to make the stricken deer their prey; and the indigenous Anatolian barbarians, who thus missed their opportunity of becoming co-partners of local Visigothic *laeti* in establishing an Anatolian barbarian successor-state of the Roman Empire, allowed themselves to be enlisted, instead, in the Roman Imperial Army and eventually to be used by a Constantinopolitan Imperial Government for the reconquest of an Ostrogothic successor-state of the Roman Empire in Italy.²

This series of energetic Roman acts of state, which were as prescient as they were strong-minded, successfully exorcized a sinister possibility that, in the course of the fifth century of the Christian Era, Anatolia might become the site of an Alano-Gothico-Isaurian barbarian principality corresponding to the actual fifth-century Alano-Vandalo-Berber successor-state of the Roman Empire in North-West Africa and to the fourth-century Tibetan, Hiongnu, To Pa, and Sienpi successor-states of a Sinic oecumenical empire in the Yellow River Basin. Late Imperial Roman statesmanship did not, indeed, rise to the height of saving the whole of the cradle of Hellenism from being swamped, like the cradle of the Sinic Civilization, by an influx of barbarism. Justinian's improvident expenditure of an irreplaceable residue of Illyrian man-power on the indulgence of his perverse ambition to reconquer Italy had to be paid for before the close of the sixth century by a stampede of the Avars' Slav 'human cattle' into a Continental European Greece which had been saved from becoming the prey of the Visigoth war-lord Alaric by Stilicho's generalship in A.D. 396 and by the diplomacy of Constantinopolitan ministers of state who had unobtrusively sped a departing barbarian guest in A.D. 410. But, though the European half of the cradle of Hellenism thus suffered, in a post-Justinianean deluge, the fate that overtook the entire cradle of the Sinic Civilization after the débâcle of the United Tsin, the Asiatic half of the Hellenic Society's original patrimony was saved from the same doom by the defeat of the Arabs' attempts to capture Constantinople in A.D. 673-7 and A.D. 717-18, and by the miscarriage in A.D. 823 of a formidable insurrection of Slav

¹ See IV. iv. 325 and V. v. 206, n. 1.

² See IV. iv. 324-5 and VI. vii. 335-7.

laeti who had been planted in Anatolia to till fields left fallow there by the extermination of these Slavs' Gothic predecessors in A.D. 400.¹

The preservation of this citadel of Hellenism in Anatolia during the social interregnum that followed the dissolution of the Hellenic Society elsewhere was a feat of the same kind as the preservation of a citadel of the Sinic culture in Southern China during the interregnum that followed the dissolution of the Sinic Society in the Yellow River Basin; and this common achievement on the politico-geographical plane is, as we have seen, one of two distinctive common assets which account, between them, for the remarkable robustness of both the T'ang Empire and the East Roman Empire by comparison with such anaemic ghosts as the Holy Roman Empire and the Ch'ou Empire. The two exceptionally stalwart *revenants*' other special common achievement was, as we have also already noticed, the revival of a professional lay civil service. We may now go on to observe that, of the two achievements, this institutional feat was by far the more efficacious in assisting the wraith of a dead oecumenical empire to clothe itself in flesh and blood. The truth is that the part played in the two miracles of reincarnation by an inviolate South Chinese fortress in the one case and by an inviolate Anatolian fortress in the other case was only a passive one. The mere survival of a cultural asylum would have been of no avail in itself if it had not served to give sanctuary to an imperial corporation by whose action a suspended imperial administration's paralysed, but never fatally dislocated, heart could be conjured into beating again; and, when we compare the relative success of the Han régime's and the Roman régime's residuary legatees in weathering this ordeal of hibernation, we shall find that the Han imperial civil service far surpassed its Roman counterpart in both the extent and the success of its performance.

During a post-Roman interregnum the anarchy into which the central and eastern provinces followed the western provinces after the murder of the Emperor Maurice in A.D. 602 put out of action, here too, an imperial administrative machine that in the western provinces had already ceased to function some two hundred years earlier; and, even when an eventual break of political continuity in the central provinces, which had lasted, when it had come, for not less than four generations, had been followed at length by Leo Syrus's evocation of an East Roman ghost of the Roman Empire in Anatolia in A.D. 717, another 147 years had still to pass before this local simulacrum of the Roman Empire was to be endowed with a local simulacrum of the Roman civil service²

¹ The largest settlements of Slav *laeti* in Anatolia of which a record survives took place during the first reign of the Heraclian Emperor Justinian II (*imperabat* A.D. 685-95 et 704-11) (see Vasiliev, A. A.: *Histoire de l'Empire Byzantin* (Paris 1932, Picard, 2 vols.), vol. i, pp. 288-9). Thomas the Slav, who was the leader of the great Anatolian insurrection of A.D. 821-3, was the offspring of a Slav family settled at Gaziura (Toqat) in the Armeniac army-corps district, and the Anatolian Slavs were one of the dissident elements in Anatolia that joined his standard. The insurrection was not, however, confined to the Slav element in the population of Anatolia, and Thomas was aiming at a more ambitious objective than the establishment of an Anatolian Slav successor-state of the East Roman Empire. His aim was to make himself master of the East Roman Empire itself, and this was why he wasted his strength on a fruitless siege of Constantinople.

² The conspicuous absence of an administrative renaissance of the Diocletianic Roman Imperial régime in the administrative organization of Leo Syrus's East Roman Empire has been noticed in VI. vii. 357, n. 4.

thanks to the foundation of the Caesar Bardas' college in the Magnaura in A.D. 864.¹ By comparison with this undistinguished post-Roman administrative record in the limited area once occupied by the Roman Empire's central provinces, the heirs of the Han imperial civil service gave a far better account of themselves. To begin with, they maintained their corporate life and remained on active service without any break at all in the Sinic World's southern citadel, to administer a southern remnant of the Sinic universal state, under its successive 'Eastern Tsin', Sung, Ts'i, Liang, and Ch'en dynasties, from the date of the installation of a refugee Imperial Government at Nanking in A.D. 318 down to the date of the political reunification of the entire former domain of the Han Empire through the conquest of the Ch'en by the Sui in A.D. 589.² Thereafter, this never incapacitated southern residue of the Sinic imperial civil service was able, in virtue of having survived as a going concern in the South, to provide the Northern political necromancer T'ang T'ai Tsung with the fund of professional man-power that he required in order to create a unitary oecumenical civil service for his resuscitated unitary oecumenical empire.³ This seventh-century Far Eastern feat of necromancy had a Northern as well as a Southern historical background; and in this Northern episode the heirs of the Han imperial civil service had acquitted themselves like men in a role that had demanded far greater heroism than their contemporary performance in the South, highly creditable to them though this southern performance was.

T'ai Ts'ung would never have been able to reintroduce the Han tradition of imperial administration into a politically dominant North from a newly annexed South, nor indeed have been capable even of conceiving in his own mind the ambitious project of incubating this administrative renaissance, if the great T'ang statesman himself, and his predecessors of barbarian origin who had been ruling the North ever since the collapse of the United Tsin régime there at the beginning of the fourth century of the Christian Era, had not already been profoundly Sinified in the course of the 278 years that had elapsed between the sack of Loyang by the Hiongnu in A.D. 311 and the annexation of the Ch'en Dynasty's attenuated Southern Empire by Sui Wên-ti in A.D. 589. The founder of the Hiongnu successor-state of the United Tsin Empire, Liu Yuan (*'imperabat'* A.D. 304-10), was already so far Sinified that he sought to legitimize his usurpation by claiming descent from the founder of the authentic Imperial Han Dynasty, Han Liu Pang, and styling his own dynasty 'Pe Han' ('Northern Han') accordingly.⁴ The deliberate self-Sinification of *ci-devant* barbarian intruders

¹ See IV. iv. 345.

² See VI. vii. 369.

³ See VI. vii. 365, n. 4.

⁴ See Franke, O.: *Geschichte des Chinesischen Reiches*, vol. ii (Berlin and Leipzig 1936, de Gruyter), pp. 40-45, and the present Study, V. v. 273. This practice of adopting the name of some dynasty of the Ch'ou Age of Sinic history, which had been canonized posthumously as classical, had perhaps been invented by Liu Yuan's alleged ancestor Liu Pang himself; for Liu Pang had taken over the dynastic title 'Han' with the territory (ruled, in the Ch'ou Age, by a local dynasty of that name) which had happened to be the first scrap of the spoils of the Ts'in Empire to come into Liu Pang's possession (see VI. vii. 172). After the fall of the thus self-styled Imperial Han Dynasty, their practice was imitated in the nomenclature of almost all succeeding dynasties—indigenous and bar-

on the sacred soil of the original homeland of the Sinic culture in the North was thus coeval with the first overt establishment there of barbarian successor-states of the United Tsin; and this Herodian movement reached its totalitarian climax in the Sinomane measures taken in A.D. 494-6 by an ex-barbarian ruler of a temporarily reunited North whose To Pa provenance was disguised under the dynastic name 'Wei' and the throne-name Hiao Wên-ti.¹

This intensive and progressive Sinification of the immigrant barbarian squatters in the North, who established successor-states of the United Tsin Empire there in and after the beginning of the fourth century of the Christian Era, is the cultural background of the administrative unification of the South with the North of a nascent Far Eastern World in the seventh century by the joint endeavours of a T'ang heir of these Sinophil barbarian war-lords in the North and a Confucian imperial civil service which had succeeded in preserving its continuity during a post-Han social interregnum and which welcomed an opportunity of co-operating with the Northern ruler of a reunited empire in giving practical effect to cultural and administrative ideals that T'ai T'sung shared with the litterati. The survival of the Sinic culture in the South during this age is adequately explained, as we have seen, by the impregnability of the southern fortress which had been provided for a senile Sinic Society by far-sighted and energetic Prior Han empire-builders. But how are we to explain the same Sinic culture's contemporary survival in the North, where the open plains of the Wei Basin and the Lower Yellow River Basin had been swept by the icy blast of a Eurasian Nomad whirlwind in spite of the massive artificial windbreak that had been erected, for the protection of this northern homeland of the Sinic culture, by the Titans who had built the Great Wall? An answer to this question may perhaps be yielded by a further pursuit of our comparative study of post-Sinic and post-Hellenic history.

If we explore this synoptic view, the first point that we shall notice is that, in the first phase of the interregnum following the break-up of a Sinic universal state, all the fragments of a now dissolved Han Empire's former domain still remained provisionally exempt, during a period of grace which lasted for more than a century, from seeing the calamity of partition capped by the still more grievous calamity of falling under barbarian rule. In the Age of the Three Kingdoms (*dimicabant* A.D. 221-263/80), the Northern successor-state of the Han Empire, as well as its two southern rivals, was a work of native Sinic hands; and here, at the very outset, the courses of these two comparable episodes of post-Sinic history and post-Hellenic history diverged on lines which placed the Sinic Society at a relative advantage over its Hellenic contemporary; for a corresponding chapter of Hellenic history that had the same opening quickly took a different turn.

When in A.D. 395 a post-Diocletianic Roman Empire was divided into two indigenous successor-states as a consequence of Theodosius I's

barian, parochial and oecumenical, alike—down to the end of Sinic history and throughout the subsequent course of Far Eastern history until the abolition of the imperial régime in China in A.D. 1911.

¹ See V. v. 477-8.

concern to provide an appanage for either of his two sons Arcadius and Honorius, this bi-partition of the Roman Empire was carried out smoothly and peacefully, in auspicious contrast to the bout of political and social disorder in the Sinic World at the turn of the second and third centuries of the Christian Era which was the price of the tri-partition of the Han Empire in that generation. Yet, on the morrow of the division of the Roman Empire into an appanage for Arcadius in the central and eastern provinces and an appanage for Honorius in the western provinces, the western indigenous successor-state of Theodosius's unitary Roman Empire fell a prey to barbarian war-lords whose power spread so far and wide and increased so rapidly, both in the provinces and at the centre, that in A.D. 476, only eighty-one years after Theodosius's death, the last successor of Honorius was compelled to abdicate by a barbarian gangster who, in virtue of being accepted as their leader by the barbarian mercenary troops in Italy, was already master, *de facto*, of all the territory still remaining under the effective control of the government ruling in the name of Honorius's successors, while the outlying fragments of this shattered western indigenous successor-state of the Roman Empire that had not already passed out of local Roman hands by A.D. 476 went the same way as Italy when in A.D. 481¹ the Scirian usurper Odovacer added the ex-emperor Nepos' principality in Dalmatia to the Italian dominions which Odovacer had already taken over from the ex-emperor Romulus 'Augustulus', and when in A.D. 486 the Salian Frankish war-lord Clovis wrested the Seine Basin out of Syagrius's hands.

In the next chapter of our synoptic history, we again find an identical movement working itself out on different lines in the Sinic and in the Hellenic case. The identical movement in this chapter was an endeavour on the part of one of the indigenous successor-states of a divided oecumenical empire to re-establish a lost imperial unity by force of arms. The United Tsin's successful reunification (*stabat* A.D. 280-317) of the whole former domain of the Han Empire has its counterpart in the partial success of the Constantinopolitan Emperor Justinian (*imperabat* A.D. 527-65) in reuniting African, Italian, and Spanish fragments of a defunct Honorian indigenous successor-state of the Roman Empire with an Arcadian indigenous successor-state that was still a going concern. These two endeavours had not only a similar general aim but also a similar general sequel; for in both cases the attempt to re-establish a lost imperial unity so cruelly taxed the human and material stamina of the indigenous successor-state whose resources were expended on the pursuit of this ambitious politico-military aim that the successors of Justinian and Sse-ma Yen (alias Tsin Wu-ti) not only found themselves unable to maintain the imperial unity that their predecessors had re-established at so heavy a cost, but also had to witness the collapse of their régime even in their own metropolitan territories. Justinian's successors paid for Justinian's excesses by seeing his and their momentarily swollen dominions reduced to the confines

¹ See Bury, J. B.: *A History of the Later Roman Empire from Arcadius to Irene*, 395 A.D.-800 A.D., 1st ed. (London 1889, Macmillan, 2 vols.), vol. i, p. 279.

of Anatolia through the loss of their South-East European provinces to the Slavs and of their Oriental provinces to the Arabs, while the successors of Tsin Wu-ti lost to barbarian successor-states the entire domain of the northern indigenous successor-state of the Han Empire which had been the Tsin dynasty's original base of operations, and were forced to transfer their capital to a recently annexed South over which they still retained their hold after they had ceased to reign over a reunited Sinic universal state.

In these respects the Justinianean chapter of Hellenic history and the United Tsin chapter of Sinic history ran on parallel lines; but this resemblance was accompanied by differences which had their origin in the preceding divergence between the Sinic and the Hellenic course of events. In order to translate the course of Hellenic history in the Justinianean Age into the corresponding Sinic terms, we should have to imagine that in the foregoing post-Theodosian Age the Honorian indigenous successor-state of a unitary Roman Empire had not only been as successful as the Arcadian indigenous successor-state was in crushing the attempts of barbarian war-lords to make it their prey, but had lived on through the fifth century of the Christian Era into the sixth century in order to achieve—and this completely—from a seat of government at Milan or Trier the reunification of the Theodosian Empire which was actually achieved in part by Justinian from a seat of government at Constantinople; and we should then have to imagine an Honorian Empire which had shown this impressive capacity for survival and recuperation suddenly suffering after all, at the end of this imaginary Roman imperial story in the sixth century, the fate which it actually suffered in the fifth century when its dominions were divided up among a host of usurping barbarian war-lords.

When we see the northern indigenous successor-state of the Han Empire eventually meeting this Honorian fate, our first thought is likely to be that the auspiciously un-Honorian path which this northernmost of 'the Three Kingdoms' had managed to follow during the preceding hundred years had not, after all, made any difference in the end. What had it profited the North, in the long run, first to keep the local reins of government out of barbarian hands and then to reunite the whole former domain of the Han Empire under its own indigenous régime, if in the third chapter of the story it was destined to be overtaken, as it was overtaken, by the doom which descended upon an Honorian indigenous successor-state of the Roman Empire no later than the morrow of its establishment? Any such first impression that the former northern provinces of the Han Empire under a belatedly established barbarian régime were no better off than the former western provinces of the Roman Empire under a promptly established barbarian régime will, however, give way to very different second thoughts when we go on to look at the third chapter of our synoptic history; for in a barbarian-ruled western fragment of the Hellenic World there was no sequel corresponding to the brilliant recovery of an apparently moribund culture in a barbarian-ruled northern fragment of the Sinic World.

The cultural sequel in the Far East to the establishment of barbarian

successor-states of the United Tsin was, as we have seen, a Sinification of these barbarian war-lords and their followers which reached its climax in the reign of the To Pa chief who took so seriously his Sinic duties as the 'Wei' Emperor Hiao Wên-ti (*imperabat* A.D. 490-9). The thorough-going reception of his Sinic subjects' culture in A.D. 494-6 by this To Pa successor of the United Tsin was the logical sequel to the assumption of the imperial title by Hiao Wên-ti's ancestor To Pa Kuei in A.D. 398¹ and to the conversion of the To Pa horde itself from a Nomad to a sedentary way of life by Kuei's grandfather Shi-i-kien (*dominabatur* A.D. 338-76);² and, during the century intervening between Kuei's reign and Hiao Wên-ti's, Kuei's presumptuously Herodian gesture had been justified politically by his barbarian 'Wei' Dynasty's success in extinguishing all rival barbarian successor-states of the United Tsin Empire and enlarging the borders of a thus politically reunited North of the Sinic World by stretching out a long arm towards the Tarim Basin.³

This was, it is true, the limit of the To Pa Power's political achievement; for, when Hiao Wên-ti sought to crown his predecessors' successes by uniting the South with an already reunited North, he suffered in A.D. 495, at the hands of the Ts'i, as decisive a defeat at the first ditch of the southern fortress in the Huai Basin⁴ as had been inflicted on his Tibetan forerunner Fu Kien in A.D. 383 by the Ts'i Dynasty's forerunners the refugee Tsin.⁵ Yet, though either of these successive disastrous outcomes of a Northern barbarian invasion of the South of the Sinic World had the same consequence as far as the South was concerned, the repercussions in the North were different in the two cases. In the South, the impregnability against Northern barbarian attack which the southern citadel of the Sinic culture displayed first in A.D. 383 and then in A.D. 495 gave the refugee culture, on either occasion, another hundred years of grace; and thanks to these successive reprieves the South was exempted from ever having to undergo the supreme ordeal of proving its mettle under even a belated experience of the *ci-devant* barbarian rule to which the North had succumbed as early as A.D. 317, since the Northern Power that did eventually reunite the South with the North in A.D. 589 was one which by that date had, as we have seen,⁶ already winnowed out the chaff of an intrusive Barbarism from the grain of an unmildewed local store of native Sinic culture. In the North, on the other hand, the effects of the two decisive battles of A.D. 383 and A.D. 495 were diverse instead of being similar and cumulative.

In the North, as we have seen, the barbarian war-lord Fu Kien's 'Ts'in' régime had been so deeply discredited by his disaster in A.D. 383 on the banks of the Huai that this local Tibetan barbarian successor-state of the United Tsin Empire immediately fell to pieces⁷ and, in crumbling, opened the way for a rival To Pa Tungus barbarian suc-

cessor-state to occupy the vacuum. The To Pa eventually reunited the whole of the North under their own rule between the year A.D. 385, in which Shi-i-Kien's grandson To Pa Kuei had declared his barbarian principality's independence under the high-sounding Sinic name 'Wei',¹ and the year A.D. 439, in which the last of the other surviving barbarian principalities in the North was extinguished.² In contrast to these Northern repercussions of the decisive battle in the Huai Basin in A.D. 383, the no less decisive battle in the same theatre in A.D. 495 did not bring to the ground the To Pa barbarian 'Wei' reproduction of the Tibetan barbarian 'Ts'in' realm. The unitary Wei régime in the North survived for another thirty-nine years; its eventual bi-partition in A.D. 534 was followed, within another forty-three years, by the reconstitution of a unitary Northern Empire under the régime of the Pe Chóu in A.D. 577; and this political reunification of the North was followed in its turn, within twelve years, by a third, and this time at last successful, endeavour on the part of a Northern war-lord to conquer the South. An enterprise that had proved to be beyond a Tibetan Ts'in Fu Kien's strength in A.D. 383, and still beyond a To Pa Wei Hiao Wên-ti's strength in A.D. 495, was thus eventually achieved in A.D. 589 by a Chinese Sui Wên-ti who had supplanted his Hiongnu Pe Chóu master in the North in A.D. 581.

In this perspective the histories of the former northern provinces of the Han Empire during a post-Han interregnum and the former western provinces of the Roman Empire during a post-Roman interregnum take on very diverse appearances. When we look in a post-Roman Western Europe for a counterpart of the Wei Empire in a post-Han Northern China, the Merovingian Power will be the closest match that we shall find. Like the To Pa under the Wei régime, the Franks under the Merovingian régime progressively swallowed up the neighbouring barbarian successor-states of the Roman Empire that had been carved out by rival barbarian war-bands. Clovis himself annexed the Alemannic principality in Alsace and Swabia in A.D. 496 and threw the Visigoths out of Gaul in A.D. 507; in A.D. 528 Clovis's successor Theodoric I stretched out his arm into a then still barbarian interior of the Continent as far eastward as Thuringia; and the Burgundian principality in the upper basin of the Rhône and the Saône was definitively annexed to an expanding Frankish realm in A.D. 532-4. If there is any period in the Merovingian Frankish annals that invites comparison with the half-century of To Pa history, ending in the year A.D. 495, during which the Wei régime was at its zenith, we shall find this Merovingian equivalent 'in good King Dagobert's palmy days'.³ As soon, however, as we confront the Merovingian and the Wei dispensations with one another, as they were in these periods of their respective *floruits*, we become aware of the immensity of the Wei régime's relative superiority.

¹ See *ibid.*, p. 105.

² See Herrmann, A.: *Historical and Commercial Atlas of China* (Cambridge, Mass. 1935, Harvard University Press), p. 29, Map IV.

³ Barham, R. H.: *The Ingoldsby Legends*, Second Series: 'The Lay of Saint Medard', line 1.

The first point of diversity that strikes the eye is a difference in the degree of success in the enterprise of empire-building. Whereas the Wei Power had succeeded in reuniting the whole northern third of the Han Empire's former domain under its own exclusive rule by A.D. 439, and was able thereafter to hold these dominions together till A.D. 534, the Merovingian Power never succeeded in reuniting under its own rule more than a Gallic splinter of a western fragment of the former domain of the Roman Empire. The Franks left it to their Lombard fellow barbarians to undo Justinian's work in Italy, and to their Arab fellow barbarians to undo the same ineffectual Roman spendthrift's work in Africa and to complete in the Iberian Peninsula the work of liquidating Visigothia which Clovis, the founder of the Merovingian Dynasty's fortunes, had begun in Gaul some two hundred years earlier. But this balance sheet of relative successes and failures in acquiring political dominion over territory is a crude test of relative total achievement, and to get to the heart of the matter we must lift our comparison from the political to the cultural plane. It is here that the contrast between the sterling Sinism of a Hiao Wên-ti (*imperabat* A.D. 490-9) and the transparent barbarism of a Dagobert I (*regnabat* A.D. 629-39) brings to light the full measure of the breadth of the gulf between these two barbarian essays in writing an epilogue to the history of a fallen civilization.

So far from finding an adequate counterpart in the Merovingian Frankish dispensation at its apogee, the Wei dispensation at its apogee, when it achieved on the political plane an integral reunification of one-third of the former domain of the Han Empire, was performing a feat which, in the western portion of the former domain of the Roman Empire, was not performed by the Franks until after the Merovingians had been supplanted by the Carolingians. And even a Carolingian Frankish dispensation that might venture to challenge comparison with the Wei dispensation on the political plane could not hold a candle to it on the cultural plane—not even in the light of the Carolingian linguistic and literary renaissance.¹

Manifestly this immense difference in the cultural outcome of our synoptic history of a post-Han Northern China and a post-Roman Western Europe must be traceable to the operation, in Northern China in the post-Han Age, of some potent force, making for the resurgence of a classical culture there, which was not in action in the post-Roman Age in Western Europe; and this force that availed to decide the destiny of the Far East was none other than the pertinacity of a corporation of masters of Confucian arts in holding their ground, not only within the cosily sheltered precincts of a politically inviolate southern citadel where a Confucian licentiate could continue to practise his administrative profession, but also in the bleakly exposed waste land of a North that had fallen under barbarian rule.

"The gist of the political history of the Far west [of the former Sinic World during the post-Sinic interregnum] is to be found in the vicissitudes of fortune in struggles between military leaders of [barbarian] war-bands

¹ See p. 63, above.

—Sienpi, Tanguts, Tibetans, and Huns—in which the Chinese element can hardly be said to have played an independent role. Every petty captain of mercenaries who enjoys an official status and has troops at his command becomes the ruler of a piece of territory, makes himself independent, and founds a state in which all the [traditional Sinic] imperial pomp and circumstance—a distinctive dynastic era, the supreme sacrificial rites, the traditional offices of state, and the rest—is faithfully reproduced. And thus, while the political power of the Chinese population in the North dwindles to the vanishing point of a complete insignificance, the formal institutions of the Sinic State succeed in subjugating every [barbarian] people and every [barbarian] ruler, in the teeth of all other spiritual influences, in virtue of their being enjoined by Confucian doctrine. . . . Confucianism was the force to which the [Sinic] universal state (*Weltstaat*) owed its salvation and its renaissance.¹

This northern triumph of the official Sinic imperial philosophy of state is the more impressive in view of the unparalleled strength of those 'other spiritual influences' with which Confucianism had to contend in a northern arena; for the same Sinic corporation of Confucian licentiates that was endowed, in the Han Empire's inviolate southern citadel, with a local asylum, for which they would have been envied by post-Diocletianic Roman imperial civil servants, had to hold their ground in the North against a convergent drum-fire of radioactive alien spiritual influences that their Roman confrères were never called upon to face in any quarter.

A Sinic World under a Han imperial régime and an Hellenic World under a Roman imperial régime were both exposed, like other disintegrating civilizations in their universal states, to the impact of alien spiritual influences of two kinds—higher religions organized in universal churches making their epiphany among an internal proletariat, and the barbarian ethos of an external proletariat's Heroic Age—but the distribution of the incidence of this twofold impact was quite different in the two particular cases with which we are concerned at the moment. The Hellenic World in its universal state was attacked by Barbarism and Religion² from opposite quarters of the compass; and, though the two attacking forces' fields of fire did eventually come to overlap in the last phase of the assaulted civilization's débâcle, there was never a stage of the battle at which the defence had to contend with both invaders at once on one and the same sector of the perimeter of Hellenism's beleaguered fortress.

The province of the Hellenic World in which Christianity made its earliest lodgement in the greatest force, and entrenched itself thereafter most strongly, was an Anatolia which Saint Paul and his fellow missionaries rapidly overran from a base of spiritual operations at Antioch;³ but this precociously Christianized province of Hellenism in Anatolia

¹ Franke, O.: *Geschichte des Chinesischen Reiches*, vol. ii (Berlin and Leipzig 1936, de Gruyter), pp. 112 and 55.

² Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, chap. lxxi (already quoted in this Study in I. i. 42 and IV. iv. 58).

³ In VI. vii. 93–95, we have noticed that, in making this conquest of Anatolia from a North Syrian base, Saint Paul was brilliantly succeeding on the religious plane in an enterprise which the Seleucidae had previously attempted on the military and political plane with signal ill-success.

did not come within the range of barbarian infiltration from Northern Europe and the Great Western Bay of the Eurasian Steppe until long after Hellenism and Christianity in Anatolia had already negotiated an *entente* with one another; and Hellenism's local success in making Anatolia into a citadel for itself in the fifth century of the Christian Era¹ was partly due to the support which Hellenism received here in this crisis from a Church that, in Anatolia, had long since been converted from Hellenism's adversary into its ally. The measures taken by a Constantinopolitan Imperial Government to forestall Gothic and Alan attempts to give Anatolia the alternative destiny of becoming one of the Roman Empire's barbarian successor-states thus proved effective partly because Hellenism never found itself constrained in Anatolia to contend with two alien enemies at once; and in the western provinces of the Empire, where a contemporary Honorian imperial régime failed to save itself from being supplanted by barbarian usurpers, the only vestiges of Hellenism that survived were actually such elements of the moribund pagan culture as had already been incorporated into the cultural heritage of Christianity in this area during the brief interval that had elapsed in this western theatre of operations between the belated achievement of an *entente* between Hellenism and Christianity and the victory there of the local barbarian war-lords over the Roman Empire's Honorian indigenous successor-state.²

The wide dispersal of the geographical distribution of the two pressures of Christianity and Barbarism on the perimeter of the Hellenic World, together with the difference in the timing of the religious and the barbarian attack on Anatolia (in contrast to the virtual simultaneity of the same two alien invaders' victories over Hellenism in the western provinces), manifestly told in Hellenism's favour in its fight to save its Anatolian citadel from falling. In the corresponding episode of Sinic history the strategic circumstances were more adverse to the prospects of the defence; for Barbarism's and Religion's assaults on the Sinic World were delivered not only at the same moment but on the same front. The North had to bear the brunt of both on the morrow of the débâcle of the Han Empire at the turn of the second and third centuries of the Christian Era; and a hundred years later, on the morrow of the débâcle of the United Tsin Empire at the beginning of the fourth century, the simultaneous offensives of Nomadism and the Mahāyāna against the same northern front of the Sinic World were resumed with a redoubled intensity. In sharp contrast to this twofold ordeal to which the North was subjected for some four hundred years ending in A.D. 589, the southern citadel of the Sinic culture in the same age suffered little more heavily from the Mahāyāna's spiritual infiltration than from the Nomads' attempts at military invasion.

¹ See the present Annex, pp. 662-5, above.

² 'Unlike Christian Byzantium, Christian Rome represents only a brief interlude between Paganism and Barbarism. There were only eighteen years between Theodosius's closing of the temples and the first sack of the Eternal City by the Barbarians. The great age of the Western Fathers from Ambrose to Augustine was crammed into a single generation, and Saint Augustine died with the Vandals at the gate' (Dawson, Christopher: *Religion and the Rise of Western Culture* (London 1950, Sheed & Ward), p. 28).

It is true that on the throne of the Southern Empire, in the last phase but one before its political reunification with the North, we are confronted by the almost Açoka-like figure of the convert-emperor Liang Wu-ti (*imperabat* A.D. 502-49), who proved the sincerity of his devotion to his Mahayanian faith by repeatedly attempting to retire from the World without regard to the public responsibilities inherent in his imperial office. And, though Liang Wu-ti's politically awkward Mahayanian Buddhist piety was manifestly an unusual phenomenon in the political life of Southern China in this imperial devotee's age, it is true on the other hand that, in the South as well as in the North, the Mahāyāna's Indo-Hellenic ecclesiastical art made a total conquest of the aesthetic faculties of Far Eastern souls that were much less prone to dedicate themselves whole-heartedly to the Mahāyāna's Indic unworldliness. Nor did either the artistic or the spiritual ray of the Mahāyāna's radiation into a Sinic Society's southern citadel play exclusively upon northern approaches where those water-barriers that so effectively baffled a predatory Nomad cavalry proved impotent to arrest an ethereal vehicle of salvation. The Mahāyāna also took South China in the rear by availing itself of an alternative southern approach along an Oceanic water-route which was taken over in the fifth century of the Christian Era by Indian apprentices of Hellenic navigators who had begun to open up the sea-routes from the Red Sea coast of Egypt to India towards the end of the second century B.C.,¹ when the Prior Han empire-builders were on the point of arriving at their 'natural frontier' on the South China coast, and who had made their first land-fall on Sinic *terra firma* in A.D. 166,² just in time to catch a glimpse of the Posterior Han Empire before its collapse.³ Yet even this far-flung encircling movement did not place the Mahāyāna in a position to penetrate the South of the Sinic World with the impetus that carried it into the heart of the North.

The Mahāyāna's overland route from its Indian cradle to its Far Eastern mission-field has already been surveyed in previous passages of this work.⁴ We have watched an esoteric philosophy turning into a popular religion as it travelled from North-West India to North-East Iran, from North-East Iran to the Oxus-Jaxartes Basin, and from the Oxus-Jaxartes Basin to the Tarim Basin; and from the Tarim Basin we have seen a nascent Mahāyāna being transmitted to the internal proletariat of the Sinic Society as a lasting and momentous religious consequence of a transitory and inconclusive series of border wars between the Kushan and the Posterior Han Power in which the Tarim Basin more than once changed hands between the two contending empires round about the turn of the first and second centuries of the Christian Era.⁵ The temporary reincorporation of the Tarim Basin into the Sinic

² See Fitzgerald, C. P.: *China, A Short Cultural History* (London 1935, Cresset Press), pp. 193-4.

³ A.D. 166 was the year in which the Confucian civil servants of the Han régime formed an abortive association for the purpose of combating the influence of the eunuchs who were bringing the Han Empire to ruin (see VI. vii. 371, n. 3).

⁴ See IV. iv. 65, n. 4; V. v. 133-46; and IX. viii. 90 and 91.

⁵ See V. v. 142-5 and IX. viii. 95.

universal state, and of its Iranian inhabitants into the Sinic Society's internal proletariat, at this date opened the way for the Mahāyāna to travel on eastwards in search of the fortune that awaited it in a wider world.

The subterranean proletarian channels through which the Mahāyāna permeated were social counterparts of those masterpieces of hydraulic engineering, called *qanāt* or *kārīz*, through which, in the thirsty climate of Central Asia, the life-giving waters of the mountain springs were conveyed over vast distances underground in order, at the end of their long hidden course, to emerge at last on the surface of the plain and there to transfigure a desert into a garden through the far-borne waters' fruitful marriage with a soil whose latent fertility had been awaiting this magic rite of baptism. The geographical route along which a spiritually rejuvenating Indo-Hellenic higher religion made its way to the Far East was the narrow corridor of Sinically cultivated territory between the southward-looking inner face of the western extremity of the Great Wall and the northward-pointed foot of the northern escarpment of the great Tibetan Plateau. In crossing the watershed between the Upper Yellow River Basin and the Wei tributary of the Lower Yellow River on the eve of the Han Empire's débâcle, the Mahāyāna impinged on the northern cradle of the Sinic Civilization, rose to the surface of a Sinic Society whose social crust was at that moment caving in, burst into spiritual flower, and at the same time encountered the barbarians who were likewise taking advantage of the collapse of the Sinic dominant minority's universal state in order to break into the Wei Basin and the Lower Yellow River Basin out of a Eurasian Steppe from which those homelands of the Sinic culture were now no longer screened by any effective defence of the Great Wall.

This simultaneous invasion of the North of the Sinic World by the Eurasian Nomads and by the Mahāyāna plunged the Confucian litterati there into a sea of troubles. The breakdown of the Han régime had already been a disaster for them in itself, since it had deprived them, outside the bounds of the southern citadel, of the authority and emoluments deriving from a monopoly of the imperial civil service which they had been enjoying since the reign of their first imperial patron Han Wuti (*imperabat* 140-87 B.C.).¹ To accentuate their discomfiture, these unemployed Confucian civil servants now lost whatever moral influence they might previously have been able to exert on the internal proletariat of the Sinic Society; for the collapse of a Sinic oecumenical empire which threw these representatives of a *ci-devant* Sinic dominant minority out of official employment also brought appalling tribulations on the rank-and-file of a Sinic body social that had been relieved of the relatively efficient and benevolent rule of the Confucian litterati only to fall into the rough and clumsy hands of parvenu barbarian war-lords; and these cruel experiences moved the masses to look to non-Confucian quarters for relief and solace. A third blow suffered by the Confucian litterati in the North was their new barbarian masters' disinclination to re-employ them in the administrative service of the Han Empire's nascent barbarian successor-states.

¹ See V. v. 418-19, 654-5, and 708; and VI. vii. 355.

This unfriendliness of the barbarians towards the Confucians seems to have had two psychological roots. In the first place the barbarian usurpers of Sinic imperial prerogatives were well aware that the *ci-devant* imperial civil servants—whose interests, traditions, and principles conspired to make them 'die-hard' legitimists—were bound to be unfriendly to régimes whose pretensions they did not acknowledge; and the barbarians' consequent lack of confidence in the Confucians' loyalty made them anxious to dispense with these Confucians' services if they could find effectively trained Buddhist or Taoist substitutes for them.¹ In the second place the fascination which was exerted on the imagination of these, as well as other, militarily triumphant barbarians by a culture whose spiritual superiority was not effaced by its military defeat was counteracted to some extent, in this case as in others of the kind, by the victorious barbarian's usual desire² to distinguish his lordly self from his contemptibly servile subjects by wearing and airing the cultural badges of an unorthodox religion and an heroic poetry; and, in the sphere of religion, a Mahāyāna that was as alien an intruder on Sinic soil as the barbarian war-lord himself seemed to offer this military conqueror the distinctive religious emblem that he required.

Thus the Confucian ex-civil servants of an indigenous Sinic imperial régime who were left stranded in the North by the ebb of the imperial power after the fall of the Posterior Han, and *a fortiori* after the fall of the United Tsin, were constrained to watch their once docile Northern Sinic sheep straying out of a now dilapidated Confucian fold in search of some alternative spiritual shelter against the steppe-wind's icy blast, and at the same time to watch the once effectively barred-out barbarians who had now invaded the sacrosanct Sinic imperial paddock looking about them in Buddhist and Taoist quarters for new shepherds to employ in rounding up the scattered flock. In lieu of a Confucian philosophy which, like other philosophies, was a closed book to the unsophisticated and cold comfort to the afflicted,³ the common run of Sinic provincials in the North under an oppressive barbarian tyranny turned for comfort to a higher religion which offered a prospect of release from the painfulness of life;⁴ and such members of a Sinic internal proletariat as were not gathered into the bosom of the Mahāyāna fell into the net of an indigenous Taoist Church which had managed in the wilderness to survive a four-centuries-long Confucian ascendancy, and whose prelates now shrewdly observed and slyly imitated the methods of appeal by which the Mahāyāna was rapidly making its fortune on Far Eastern ground.⁵ These two religious by-paths along which a suffering Sinic rank-and-file sought ways of spiritual release turned out also to be avenues to worldly advancement owing to the barbarian usurpers' policy of seeking civil servants who would be literate without being Confucian; and the ousted Confucian litterati thus had the double mortification of seeing apostasy to an alien Mahāyāna and to

¹ See the passage quoted, in VI. vii. 371, from Fitzgerald, C. P.: *China, A Short Cultural History* (London 1935, Cresset Press), p. 275.

⁵ See V. v. 557-68.

a charlatan Taoism rewarded by appointment to offices of state from which Confucian licentiates were now *ex officio* debarred after having formerly been *ex officio* the only candidates eligible.

It is not surprising that, in these discouraging circumstances, a large number—perhaps a majority—of the Confucian litterati in the North should have taken the easy and attractive option of migrating to an inviolate southern citadel of the Sinic World in order to pursue their professional career in the administrative service of the refugee Tsin Dynasty and its southern successors.¹ The astonishing thing is that any of them should have elected to stay out in the cold; and it seems at first sight positively miraculous that this steadfast, but tiny, remnant² should eventually have captivated the barbarian rulers who had deliberately put these Confucian ex-imperial civil servants out of business.

In the sequel, as this progressively unfolded itself in the North in the course of the 278 years running from the sack of Loyang in A.D. 311 to the *Gleichschaltung* of a residue of the Southern Empire by the Chinese Northern war-lord Sui Wên-ti in A.D. 589, the disestablished remnant of the corporation of Confucian litterati in the North won their first victory when they subtly prevailed upon the local barbarian usurpers voluntarily to mould their illegitimate successor-states into likenesses of the Sinic imperial régime that they had supplanted by force; and an inevitable corollary of this change of countenance on the barbarians' part was, of course, the reinstatement in office of Confucian licentiates who were the sole repositories of Sinic *arcana imperii*.³ These reinstated northern survivors of the Sinic imperial civil service were not, however, content with their success in thus inducing the barbarians who had dismissed them to re-employ them. To their mind, the re-establishment of the Confucian form of government was incomplete so long as the Confucian officiants in these civil rites were performing their ritual duties in the name of mere *mulūk at-tawā'if*.⁴

So soon as the re-established Confucian civil servants in the North were confident that their *ci-devant*-barbarian pupils in the Confucian lore had thoroughly taken their education to heart, they felt that the time had come to crown their long and patient work of rehabilitation by employing barbarian converts on whom they could now at last rely as instruments for achieving an ultimate aim of which they had never lost sight. The political reunification in A.D. 589 of the South with the North of the former domain of the Sinic universal state might look, from the Northern Barbarians' standpoint, like an attainment, by the

¹ See Fitzgerald, *op. cit.*, p. 275, quoted in VI. vii. 371.

² By the year A.D. 405 the surviving non-Buddhist element in the population of the North had dwindled to a ratio of about 10 per cent., including the Confucians' Taoist competitors as well as the Confucians themselves, according to the Confucian historians' own admission (see Fitzgerald, *op. cit.*, p. 276, quoted in VI. vii. 371).

³ Tacitus: *Annals*, Book II, chap. 36, § 2; *Histories*, Book I, chap. 4, § 2. On this point see Fitzgerald, *op. cit.*, p. 286, quoted in VI. vii. 372.

⁴ The inadequacy of this half-way house was brought home to the resurgent Confucian litterati when they followed up their local reinstatement in the Northern Barbarian principalities by opening a counter-offensive against their now discomfited Buddhist competitors. 'In A.D. 446 the ruler of Wei, the Northern Empire, [at the instance of his Confucian advisers,] issued an edict against the Buddhists; but, as his rival in the [Southern] Chinese Empire was prepared to receive them, the monks were able to escape its effects' (Fitzgerald, *op. cit.*, pp. 275-6).

barbarians' Chinese legatee Sui Wên-ti, of a barbarian objective that had eluded the grasp of a To Pa Wei Hiao Wên-ti before him, and of a Tibetan Ts'in Fu Kien before Wei Hiao Wên-ti; but, from the standpoint of the Confucian litterati in North and South alike, this same historic act of union looked like a reattainment—through the use of a now Chinese-controlled Northern Empire of barbarian origin—of a Confucian objective which, once before, had been attained—on that occasion only to be lost as soon as gained—by the unreinforced native Sinic efforts of the United Tsin.

What is the explanation of this apparent miracle? When we trace back the causes of the political reunification of the domain of the Han Empire in A.D. 589 as far as an historical analysis can follow them, we find ourselves led back to two acts of state that were both performed by the Prior Han Emperor Wuti (*imperabat* 140–87 B.C.): his endowment of the Sinic World with an impregnable southern citadel, through his southward expansion of his dominions up to the natural frontier presented by the South China Coast, and his investiture of the Confucian school of Sinic philosophers with a monopoly of the Sinic imperial civil service. In the light of the inquiry which we have now carried out, we shall pronounce that, of these two mighty deeds, the decisive act was, not an act of conquest that was Wuti's own exclusive achievement, but an institutional measure which would have been beyond the power even of this mightiest of all the Han Emperors if he had not been using his power merely to fulfil, in the fullness of time, the long disappointed hopes of a sage who had lived and died some four hundred years before Han Wuti's day. In short, the ultimate credit for the epoch-making renaissance of the Sinic universal state in the year A.D. 589 is shared by Han Wuti with Confucius.

The marriage of the Han imperial civil service with the Confucian school of philosophy which Han Wuti thus solemnized was the crucial event in Sinic history to which Hellenic history can show no parallel.¹ If Han Wuti's Hellenic counterpart is to be seen in the Roman Emperor Trajan, we can imagine this Roman empire-builder perhaps dreaming of equipping his Hellenic World with an equivalent of Han Wuti's southern citadel by setting himself to complete the Roman conquest of North-West Africa up to the natural frontier offered by the north shore of a Saharan sand-sea;² but we cannot imagine this prosaic-minded

¹ This capital point of difference between the respective courses of Sinic and Hellenic history has been noticed in VI. vii. 354–7.

² There is no indication that this dream ever did flit across Trajan's mind, but there is evidence that, if it ever did, it would have been doomed before birth to remain abortive, supposing that the dreamer had sought to translate it into reality; for before the end of Trajan's reign the Hellenic universal state was showing symptoms of severe strain and stress as a result of Trajan's mobilization of its resources for the pursuit of a Central European and a South-West Asian military objective, even without the aggravation of a third military enterprise on a North-West African front. After Trajan had followed up his incomplete and ephemeral annexation of an outstanding Dacian enclave of Central European barbarism by an attempt to arrive at a definitive settlement of the Roman Empire's 'eastern question', his momentary conquest of the Euphrates-Tigris Basin from Armenia to Mesênê was immediately undone by insurrections in his rear not only in the newly annexed territories but in provinces west of Euphrates which had been under Roman rule since the time of Pompey or earlier; and these unexpected and alarming complications in the East were accompanied in the West by threats of

practical soldier and administrator ever hitting upon the idea of solemnizing a marriage between a Stoic school of philosophy and a Roman imperial civil service, any more than we can imagine Trajan's third successor Marcus, in whose person the Roman imperial diadem was actually worn by a Stoic philosopher-king, summoning up either the zest or the energy or the *savoir faire* to attempt to translate into reality an ideal which Marcus, unlike Trajan, might well have entertained. In any case it is an historical fact that the Roman imperial civil service never did come to be identified either with Stoicism or with any other school of Hellenic philosophy; and, in thus remaining a mere professional corporation, this Roman civil service failed to qualify itself for outliving the oecumenical empire whose administration was its sole *raison d'être* from the beginning to the end of its professionally hide-bound existence. When the Roman Empire's Honorian indigenous successor-state was torn to shreds by contending predatory barbarians, the imperial civil servants whom this political catastrophe threw into technological unemployment had no choice open to them beyond the two courses of going out of business altogether and of finding alternative employment in the service of a Christian Church¹ which did not cease to be a going

a strike on the part of colonial communities of Roman citizens whose limited supply of man-power was no longer equal to meeting Trajan's inordinate drafts upon it. The representations made to Trajan in Mesopotamia by the representatives of the western municipalities, like those made to Alexander in the Panjab by his Macedonian veterans, were all the more compelling for being respectful; and Trajan would have found himself constrained, like Alexander, to bow to them, if Death's timely visitation had not permitted him to bequeath to Hadrian the urgent dirty work of liquidating a now patently over-ambitious South-West Asian military adventure.

In these unpropitious circumstances an attempt to subdue the vast virgin barbarian fastness in the Atlas would manifestly have been out of the question; and, indeed, if Trajan's grim North-West African cavalry-general Lusius Quietus had been given the task of completing the pacification of his own homeland, a Nomad Berber light horse that had acquitted itself brilliantly on the Mesopotamian plains might have fared ill in mountain-warfare against its sedentary Berber kinsfolk in the Atlas highlands.

The slenderness of the Roman Empire's reserves of war-potential in Trajan's day was exposed, as it was, without any need for a North-West African test, by the Central European and South-West Asian tests to which Trajan did, in fact, subject it; and this exposure gives the measure of the disparity in strength between the Roman Empire in the Age of the Principate and the Han Empire in the Age of the Prior Han Dynasty. For the Emperor Han Wuti, who successfully rounded off the Han Empire's southern marches up to the natural frontier presented by the South China Coast, was also the Prior Han emperor who committed the Sinic universal state to a war to the death against the Hiongnu Nomad lords of the eastern half of the Great Eurasian Steppe; and, though Wuti himself did not live to see this hazardous and exacting enterprise carried to completion, his eventual successor Han Yuanti did succeed, within a hundred years of the launching of Wuti's first attack *circa* 133 B.C., in gaining at least that measure of victory over the Hiongnu that Trajan succeeded in gaining over the Dacians (see V. v. 144-5 and 271).

However imperfect and transitory this Sinic triumph over a Eurasian Nomadism might be, the relative magnitude of the Sinic achievement here may be gauged from the significant fact that neither Trajan nor any other Roman empire-builder ever attempted to emulate Han Wuti's audacious attack on the Eurasian Nomads even within the confines of the Steppe's extreme Western Bay, any more than the Romans ever attempted to complete the pacification of North-West Africa by embarking on the enterprise of subjugating the Atlas and the Rif. The Sarmatians were never threatened, at Roman hands, with the fate that the Han Power inflicted on the Hiongnu; and we may guess that, if any Roman emperor had been so rash as to attack the Sarmatians, he would only have brought upon himself a repetition of the humiliation which had been suffered by the Achaemenian emperor Darius the Great when he had attacked the Sarmatians' local predecessors the Scyths.

¹ This transfiguration of frustrated Roman civil servants into creative Fathers of the Christian Church has been noticed in VI. vii. 369-70.

concern in the West when the western indigenous successor-state of the Roman Empire fell about the distracted imperial civil servants' ears.

In sharp contrast to this dilemma, from which there was no escape for Roman imperial civil servants in the Roman Empire's derelict western provinces, the Sinic imperial civil servants in the Sinic universal state's derelict northern provinces had no need to look for hospitality to an alien church in order to provide themselves with an alternative institutional framework when there had ceased to be even a fraction of an oecumenical empire for them to administer. It is true that these Sinic imperial administrators showed themselves just as blind as all but a handful of their Roman counterparts to the opportunity for a *beau geste* that was seized, according to the legend, by a Pannonian Roman soldier who impetuously divided his cloak with a beggar before the soldier's pursuing barbarian adversary had time to tear a surprisingly sanctified *sagum* from a suddenly transfigured warrior's shoulders. Like Saint Martin's civilian Roman contemporaries, the Sinic civil servants did wait stolidly to see themselves ignominiously stripped of their official robes of office; yet, in allowing themselves to incur this humiliating common experience, they were not exposing themselves, as their Roman confrères were, to face winter cold and barbarian scorn stark naked.

A Confucian civil servant who had been deprived of his official robe remained clad in his philosopher's shirt; and this respectable garment protectively covered his nakedness. With an all but deified hero-sage still to revere and confide in as his infallible master, and with a cloud of fellow witnesses,¹ past as well as present, to testify to the efficacy of a Confucian faith that had justified itself first in the glorious Wutian outcome of a four-hundred-years-long initial ordeal, the professionally unemployed passed-master of Confucian arts could bide his time, after the downfall of the United Tsin régime, without losing a *moral* which had carried his elder brethren, in their day, through their weary wanderings in the wilderness of a Sinic Time of Troubles and its first aftermath during the four centuries that had elapsed between Confucius's death and Wuti's belated advent. A patience that had once been crowned with such a dazzling ultimate reward could be practised in a second emergency with a new leaven of hope to lighten the old burden of fortitude; and, for a still living school of Confucian philosophers, this waiting game, so long as they had the strength of mind to play it, was bound, as we have seen, to be a winning game as well. After the political reunification of the whole former domain of the Sinic universal state by Sui Wên-ti in A.D. 589, the *manes* of Confucius were to see that disappointed sage's overweening pretensions posthumously vindicated for the second time; and T'ai Ts'ung's homage must have been even sweeter than Wuti's to Confucius's demurely jubilant ghost.

¹ Heb. xii. 1.

THE ROLE OF 'THE OLD KINGDOM' IN
EGYPTIAC HISTORY

WHAT is 'the Old Kingdom's' role in Egyptiac history? In this Study up to this point we have assumed that 'the Old Kingdom' was the political expression of the growth stage of the Egyptiac Civilization; but this assumption cannot be endorsed without verification, considering that, in the growth stage of other civilizations, the constellation of political forces that usually presents itself to the historian's eye is, not an oecumenical empire, but a litter of parochial states, while, in the few cases in which we do find an oecumenical empire on the scene at this stage, it can be accounted for as the product of a renaissance. The oecumenical and at the same time ineffectively ramshackle structure of the Carolingian, the Ch'ou, and the Khatti Empire, for example, is what we should expect, *a priori*, to find in an oecumenical polity which had been brought into being through the evocation of a ghost at a stage in the necromantic society's history at which it would have been incapable of achieving, or indeed of conceiving, so ambitious a programme of political construction by an independent exercise of its own creative powers without the aid of the Black Art. The ineffectiveness of the three empires above mentioned is thus self-explanatory. We have then still to explain the establishment of an efficient oecumenical polity such as, for example, the T'ang Empire or the East Roman Empire at an early stage in a civilization's growth; and, where an explanation that accounts for the facts on the hypothesis of a renaissance is not forthcoming, as it is in these two cases,¹ when we are thus confronted with the emergence of an efficient oecumenical polity at what would appear to be an early stage of a civilization's growth, we must look elsewhere for the solution of an historical problem that cannot be either ignored or evaded. A so-far unsolved problem of the kind is presented by the effective political union of Lower with Upper Egypt, to constitute 'the Old Kingdom', at a stage of Egyptiac history which is an early one according to the provisional analysis of the structure of Egyptiac history which we have been using as our working hypothesis in this Study up to the present point; for on this hypothesis 'the Old Kingdom' cannot be accounted for, like the East Roman Empire and the T'ang Empire, as a ghost of the universal state of an antecedent civilization effectively re-embodied in a reconstituted imperial civil service, since no such antecedent civilization or oecumenical empire figures either in the Egyptiac tradition or in the dossier of our Modern Western Egyptologists.

Does the enigma thus presented by 'the Old Kingdom' in our present vista of Egyptiac history require us to view Egyptiac history in a new perspective? And might a fresh avenue of interpretation be opened up

¹ See pp. 15 and 20, above.

by a recognition of the possibility that, in contenting ourselves with the view of Egyptiac history which we have taken so far, we may have been neglecting one of our own precepts? At the outset of this Study¹ we took note of the risk of error to which a student of History would be exposing himself if he were to allow his vision of an historical landscape to be governed by the fleeting distribution of the light and shade at the moment when the scene happened to be under his observation. The comparative abundance or scarcity of the evidence at an historian's disposal for the study of this and that past episode is determined for him by freaks of Chance which bear no relation whatsoever to those episodes' relative intrinsic importance or unimportance; and we should therefore be positively courting error if, in our mental reconstruction of the course of past history, we were to treat the capriciously irrational quotas of the intellectual materials at our disposal for our professional work as if these were trustworthy indexes of the true proportions of the past realities which we were seeking to bring into the focus of our present consciousness.

In administering this prefatory warning to ourselves, we commended it by citing, as an example of the consequences of ignoring it, the disproportionate concentration of the attention of Modern Western scholars on the Ptolemaic successor-state of the Achaemenian Empire, to the comparative neglect of its Seleucid sister commonwealth, and we pointed out that the consequent distortion of historical vision was the result of an unconsidered subservience to blind workings of Chance through which 'the natural museum' of Upper Egypt happened to be included among the shreds of ex-Achaemenian territory which, in the scramble for the spoils of Alexander's conquests, Ptolemy Lâgou decided to seize and managed to hold. Ptolemy's choice of Egypt for his personal prize was determined by shrewd 'geopolitical' calculations which, of course, had no connexion whatsoever with those peculiar local qualities in the climate and soil of a post-pluvial Upper Egypt that were to make the Sa'id a veritable archaeologist's paradise. Ptolemy's objective in seizing Upper Egypt was to appropriate its revenues, and, even if he might have been gratified to learn that he was also incidentally acquiring a ready-made record office in which the debris of his dynasty's acts would automatically accumulate into a collection of material evidence that moth and rust would not corrupt before thievish Modern Western archaeologists would be moved by a Faustian curiosity to break through and steal,² we may take it as certain that this consideration would have counted for nothing in his decisions if he had come to the conclusion that Egypt was a less desirable prey than the South-West Asian territories which he actually decided to abandon to Seleucus as a bone for this confederate of his to pick with their formidable common rival Antigonus.

This example provided an excellent illustration of our point; but we might have illustrated it equally well without looking so far afield from Upper Egypt as Lower Asia, and without descending so far in the Time-scale of Egyptiac history as the Ptolemaic Age. If we had confined our

¹ In I. i. 5-7.

² Matt. vi. 19-20; Luke xii. 33.

chronological horizon to 'the Predynastic Age' and our geographical horizon to the Lower Nile Valley, we could have made our point no less effectively by citing the contrast, in the archaeologist's historically misleading inventory, between the preservative powers of a dry-as-dust Sa'id and the destructive powers of a water-logged Delta; and, had we clinched our argument by adducing this illustration as well, we might have saved ourselves from what may prove to have been an hallucination in our subsequent interpretation of Egyptiac history.

The premiss of this interpretation was an assumption that the emergence of the Egyptiac Civilization could be equated, for practical purposes, with the conquest of Lower Egypt by the Upper Egyptian militarist empire-builder Narmer; and this assumption was based on the fact that in our Modern Western archaeologists' Upper Egyptian 'natural museum' the earliest extant monuments of the apparatus of the Egyptiac culture—and, in particular, the earliest specimens of its script—are attributable to this epoch. The weak point in this chain of reasoning is its unspoken and uncriticized prior assumption that an array of evidence derived almost exclusively from Upper Egypt can be treated with assurance as if it were good evidence, not merely for the local history of Upper Egypt itself, but also for the oecumenical history of the Egyptiac World as a whole. This prior assumption ignores the possibility that a relatively mature Egyptiac culture which, in our Upper Egyptian 'natural museum', has left no evidence of its existence dating back appreciably earlier than Narmer's day, may have had a previous history—and this perhaps a long one—in a Lower Egyptian 'natural destructor' of the debris of human activities.¹ And this possibility opens up the further one that the sudden appearance of, for example, an already mature Egyptiac script² in the Sa'id at the transition from 'the Predynastic Age' to Narmer's new era may be evidence, not that the Egyptiac culture suddenly came to birth in Narmer's day, but that a more advanced form of the Egyptiac culture was suddenly introduced into Upper Egypt from Lower Egypt as a consequence of Narmer's sudden forcible political unification of the two lands.

The magnitude of the possible error to which we expose ourselves in ignoring these considerations can be gauged by imagining, for the sake of the argument, that the unknown historical relation between the Sa'id and the Delta in the Egyptiac World may have been analogous to the known historical relation, in the Andean World, between the Plateau and the Coast.

In the history of an Andean World that consisted, like the Egyptiac World, of two physiographically diverse cultural provinces,³ we happen to know that the Andean culture originated in the coastal province and

¹ See Wilson, J. A.: *The Burden of Egypt* (Chicago 1951, University Press), p. 16.

² In the earliest specimens of the Egyptiac script that had been discovered by Modern Western archaeologists down to the time of writing, the characters were already being used, not as 'pictograms' giving a visual representation of objects or ideas, but as 'phonemes', in which the sound of the spoken Egyptian word corresponding to the original visual meaning of the character was associated with the character for the conveyance of this sound in other contexts. 'At the very beginning of history, Egyptian hieroglyphic writing appeared on stone and clay with this rebus-principle already accepted' (Wilson, *op. cit.*, p. 38).

³ See II. i. 322-3.

that this was the scene of successive experiences of growth, breakdown, and disintegration through which the Andean Civilization passed before its coastal birthplace was eventually united politically with a culturally parvenu highland province to constitute an Andean oecumenical empire as a result of the conquest of the lowland coastal states Chimú and Nazca by the highlander militarist Pachacutec (*imperabat circa* A.D. 1400-48).¹ The reason why we are able to see Andean history now in this true perspective is because, in Peru, the coastal province that was the true birthplace of the culture happened, like the Sa'id in the Egyptiac World, to be 'a natural museum' in which climate and soil conspired to preserve the incriminating material evidence of Civilization instead of conspiring to destroy it; and, by the time of writing, this Peruvian 'natural museum' had been explored by the enterprise of experienced twentieth-century Western Americanists with a skill and energy that would have done credit to the pioneer nineteenth-century Western Egyptologists. The bearing of these triumphs of Archaeology in Peru on the interpretation of Egyptiac history was indicated by the revolutionary violence of the change in the interpretation of Andean history which these Peruvian archaeological discoveries had dictated.

Before the archaeologists started operations in Peru, Modern Western knowledge of Andean history had been virtually confined to evidence concerning the Empire of the Incas; and, while this evidence had partly consisted in the massive material monuments of cyclopean architecture constructed by these empire-building highlanders and their neighbours and predecessors on the Plateau, the main source of information at the disposal of Western scholars at that stage had been the Incaic imperial tradition preserved in Castilian literary dress and more or less misleadingly travestied in the process.² In the picture presented in this tradition the rise and fall of the Incaic Power were equated with the beginning and end of Andean history; and, while Modern Western scholarship correctly divined, on the strength of the internal evidence, that little credence was to be given to a version of the Incaic tradition, picked up by the seventeenth-century Spanish Jesuit historian Fernando Montesinos,³ which professed to carry the record of Incaic history back to a high antiquity, this well-justified rejection of an apocryphal prelude to genuine Incaic history was merely a negative result of historical criticism, and the most acute analysis of the Incaic traditional evidence would never have brought to light the authentic early history of the Andean Civilization in a coastal province of the Andean World where neither the Incas nor their predecessors in the highland province had played any decisive part before the fifteenth century of the Christian Era.

The true perspective of Andean history could only be brought to light by the instrument of Archaeology; and, when an archaeological

¹ See I. i. 121-2.

² The life and work of the Herodian half-breed Garcilaso de la Vega have been noticed in IX. viii. 597.

³ A critique of Montesinos' *Memorias Antiguas Historiales y Políticas del Perú* will be found in Baudin, L.: *L'Empire Socialiste des Inka* (Paris 1928, Institut d'Ethnologie), pp. 17-18. Montesinos wrote this book in A.D. 1652, in the fifth generation after the Spanish conquest of the Andean Empire of the Four Quarters.

searchlight was eventually brought into action, it showed up the falsity of the picture that the Incaic tradition had presented; for even that portion of the traditional Incaic story that was not now proved false in itself was now proved to have been placed in a most misleadingly false perspective. While the traditional account of the foundation of the Incaic Empire according to the shorter of the two irreconcilable traditional schemes of chronology might still be accepted as being more or less true as far as it went, it was now shown to be, not the alpha and omega of Andean history, but merely the last chapter in the story of the Andean Civilization's disintegration.

If we were to apply this Andean analogy to our interpretation of Egyptiac history, we should find ourselves having to reckon with the possibility that the picture which we had accepted here so far might be little less misleading than an Incaic tradition which had been exploded by an archaeological bomb. The corresponding Upper Egyptian tradition was, no doubt, unlikely ever to be discredited in this conclusively objective way, because the Delta, unlike the coastal province of the Andean World, was unlikely to yield up positive archaeological evidence of the part that it had played in history. Nevertheless, the Upper Egyptian tradition which, in the absence of Deltaic archaeological evidence, had hitherto held the field was at least impugned by the sensational overthrow of the Incaic tradition at the archaeologists' hands; for an egocentricity that led the Incaic makers and masters of an Andean universal state to telescope the whole drama of Andean history into the single last act in which the Incas themselves happened to hold the stage is, as we know, a common infirmity of Human Nature; and it would be surprising if there had been no alloy of the same human weakness in the character of the Upper Egyptian makers and masters of 'the Old Kingdom' of the Two Lands. The inference to be drawn from this presumption of a taint of Original Sin would be that 'the Old Kingdom' in Egyptiac history, like 'the Empire of the Four Quarters' in Andean history, might in truth have been merely the last chapter of a long story, or, in other words, might have been, like 'the Empire of the Four Quarters', a universal state in the technical sense in which that term is used in this Study.

When once this idea has been suggested by the external evidence, it becomes manifest that there is also internal evidence which likewise testifies in favour of it.

In the first place 'the Old Kingdom' actually was a universal state in the literal sense of the words, inasmuch as it was an oecumenical empire embracing the whole domain of the Egyptiac World of the day. In the second place it exhibits the constitution and *éthos* of a universal state if 'totalitarianism' is to be regarded as one of the distinctive characteristics of this species of polity. While 'the Middle Empire', in which we have hitherto seen the Egyptiac universal state, and 'the New Empire', in which we have seen a recrudescence of it, both certainly pass muster on this test, 'the Old Kingdom' qualifies even more conspicuously for recognition as being another representative of the same species, considering that 'totalitarianism' probably asserted itself more rapidly in

'the Old Kingdom' than in 'the Middle Empire',¹ and certainly went to greater lengths in 'the Old Kingdom' than in either of its two successors.² There was no phase of Egyptiac history after the fall of 'the Old Kingdom' in which any Pharaoh could have said 'L'État, c'est moi' with the same plenitude of veracity that would have animated the Early Modern Western *Roi Soleil's* celebrated words if they had been uttered by one of the Pyramid-Builders. In other contexts we have seen how the Pyramid-Builders broke the Egyptiac Society's back,³ and how the mark made by this inordinate abuse of power on the Egyptiac Society's folk-memory bit so deep and smarted so sorely as to make it impossible for any of those titanic egoists' successors ever to emulate their total inhumanity *vis-à-vis* their subjects.⁴ In our first reading of Egyptiac history we identified the catastrophe inflicted on the Egyptiac Society by the Pyramid-Builders with the breakdown of the Egyptiac Civilization. On second thoughts we might be inclined to see in it, not the first blow, but the *coup de grâce*, and to look for the breakdown in some forgotten disaster in 'the Predynastic Age' which had passed into oblivion simply because the historical evidence happened to have been swallowed up in a Deltaic Serbonian Bog.

On the analogy of what we know about the causes of the breakdowns and disintegrations of other civilizations, we might conjecture that the Egyptiac Civilization ruined itself, like so many societies of its kind, through a failure to keep within bounds the destructiveness of a chronic warfare between parochial sovereign states;⁵ and on this line of interpretation we might see in the gruesome scenes carved on the palette of Narmer⁶ a record of the knock-out blow that brought an Egyptiac Time of Troubles to its tardy close. The measure of the incidence of an evil is apt to be reflected in the scale of the price that its victims bring themselves to pay for the sake of escaping from it; and the plenitude of the power that, under the régime of the Old Kingdom, was invested in a Pharaoh reigning on Earth as a god incarnate suggests that the suffering inflicted on the Egyptiac World by political disunity in a predynastic age of unrecorded warfare between contending parochial states was probably proportionate in its severity to the exorbitancy of the price which this society is known to have consented to pay in the next chapter of the story for an oecumenical peace which had come to be recognized as a necessity of Egyptiac life.

If we were to find ourselves convinced by the argument of our present *retractatio* of our previous interpretation of Egyptiac history, we should

¹ Wilson, op. cit., pp. 45-47, conjectures that the dogma that Pharaoh was not a man, but was a god incarnate on Earth, was officially adopted after the establishment of the United Kingdom in order to ground a political union which had originally been brought about by force upon a moral consent springing from a religious faith. He suggests that this institution took root in the time of the first two dynasties.

² See IV. iv. 408-14.

³ See I. i. 136-7 and 141-2, and III. iii. 212-15.

⁴ See IV. iv. 412-14.

⁵ In the later Predynastic Age of Egyptiac history, 'Archaeology produces a great amount of arrowheads and mace-heads, and the skeletons of the Predynastic Egyptians show an extraordinary number of broken bones. Apparently, communities had come into competitive contact with other communities, so that there was already that warfare which built little states into larger states' (Wilson, op. cit., p. 25).

⁶ See IV. iv. 502-4.

then have to revise that interpretation in two respects. We should have to suppose that 'the Middle Empire', like 'the New Empire', was a recrudescence of a universal state, and that a phenomenon which we had already detected in Egyptiac history in one occurrence had actually occurred not merely once but twice. And we should then have to regard the chapter of Egyptiac history that intervened between the fall of 'the Old Kingdom' and the rise of 'the Middle Empire' as having been, not a Time of Troubles following the breakdown of a civilization and ending in the establishment of a universal state, but an interregnum following the dissolution of a universal state and ending in this case, not in the emergence of a new civilization, but in the recrudescence of a universal state that had gone into dissolution without having lost its capacity to reconstitute itself. Such recrudescences of universal states after they had once gone to pieces might not represent the 'normal' course of History according to a standard of normality based on what had been perhaps the more usual denouement of the histories of the disintegrations of civilizations during the five or six thousand years within which a score of societies of this species had been rising and falling up to date; yet it would not be surprising to find an additional instance of the phenomenon of recrudescence in an Egyptiac history which had already shown itself peculiar by providing the historical investigator with one specimen of this unusual turn of events at a later stage in its long course. When once we have interpreted 'the New Empire' as being a recrudescence of 'the Middle Empire', there is no intellectual stumbling-block to hinder us from similarly interpreting 'the Middle Empire' as being a recrudescence of an 'Old Kingdom' which, on this revised interpretation, we should then identify as having been the original Egyptiac universal state.

We have, however, still to ask ourselves whether a view of 'the Old Kingdom's' role in Egyptiac history that is suggested by the deification of an oecumenical Pharaoh and by material evidences of the previous ravages of warfare in a Late Predynastic Age is compatible with all the phenomena that have to be taken into account in an appreciation of a period of Egyptiac history extending from the date of the unification of Lower Egypt with Upper Egypt under the First Dynasty to the dissolution of the United Kingdom under the Sixth Dynasty. In the survey of other oecumenical empires from which our concept of a universal state has been derived, we have found that one of the outstanding features of this institution is a negative one. The dominant minority that has pieced together, in a universal state, the fragments of a society that has been broken up by the same dominant minority's fratricidal strife in a foregoing Time of Troubles is conspicuously destitute of the creativity which, before the breakdown, has been displayed by its predecessors when they have been leading the rank-and-file by the persuasive arts of Orpheus instead of dragooning them with a Prussian drill-sergeant's rod.¹ If there is any creative activity in the body social of a disintegrating society in its universal state, this makes its appearance among the Internal Proletariat; it works from below upwards; and, if the Dominant Minority is ever stirred by this fresh breath of life, it

¹ See IV. iv. 122-31.

yields to it grudgingly and late in the day. Does the record of an Egyptiac dominant minority conform to this pattern of behaviour in the Age of 'the Old Kingdom'? If the first two dynasties in the history of an Egyptiac United Kingdom had been followed immediately by the Fifth and Sixth, we could have certified that, on the test of the dominant minority's being destitute of creativity, 'the Old Kingdom' would have qualified for classification as a universal state; but the performance of the Third and Fourth Dynasties—which has, of course, likewise to be taken into account—does not fit into this picture.

At first sight, indeed, it might look as if the First and Second Dynasties, too, were convicted of creativity by the sudden epiphany, at the inauguration of the United Kingdom, of an Egyptiac script at an advanced stage of development.¹ This invention, without which the problem of administering an oecumenical empire on the scale of the Egyptiac United Kingdom might well have been insoluble, must have been the fruit of a creative activity of a high potency at some time and place, but the creative act will not be debited to the Thinites' account. While, in the absence of records from the Delta, it is no more possible to prove than it is to disprove that the Egyptiac script was an independent invention of the people of Lower Egypt in the predynastic days before the political unification of the two lands, there is the alternative possibility that the idea of a script consisting of phonemes derived from pictograms may have come to the Egyptiac Society from the Sumeric World; for in the first place the archaeological record, as it stood in A.D. 1951, indicated that in Sumer the art of writing had appeared earlier than in Egypt and had developed gradually from rudimentary beginnings, whereas in Egypt it seemed to have made a sudden epiphany at an advanced stage,² while in the second place there were certain other elements of culture in Egypt in the Late Predynastic and the Early Dynastic Age which were undisputedly Sumeric in origin: for example, the cylinder seal; a panelled brick architecture; an antithetic composition of groups of figures; the portrayal of composite monsters and animals with intertwined necks; and the use of boats of a distinctively Sumeric build.³ These Sumeric influences, which had declared themselves in the Egyptiac World during the last two centuries of the Predynastic Age, continued to dominate the Egyptiac culture under the first two dynasties;⁴ and, though they may not be so important as to impugn the Egyptiac Civilization's claim to originality,⁵ they do absolve the First and Second dynasties from any imputation of creativity.

On the other hand the Fourth Dynasty, if not the Third, is convicted of creativity by an apparently sudden effacement of these Sumeric

¹ See p. 684, n. 2, above.

³ See *ibid.*, p. 37, and the present Study, IX. viii. 453, n. 2.

⁴ See Wilson, *op. cit.*, pp. 39 and 50.

⁵ Wilson contends that, for some 1,800 years out of the 2,000 years that may have elapsed between the genesis of the Merimidian predynastic culture and the establishment of the United Kingdom, 'the development of Egyptian culture was internal' (*op. cit.*, p. 37). Egypt's 'debt to the influence of Mesopotamia was very great, but the inner spiritual urge to a new way of life was the essential factor—really the only motivating factor—in the great change' in the Egyptiac way of life at the transition from the Predynastic Age to the Age of 'the Old Kingdom' (*ibid.*, p. 40).

influences, after a reign of perhaps not less than six centuries' duration according to Wilson's chronology,¹ through the abrupt creation of a new style of culture that was distinctively Egyptiac.² The initiative in this burst of creative activity manifestly came from above, not from below; its pace seems to have been extraordinarily swift, if the speed of the development of Architecture is a fair sample of it;³ and this sudden swift advance was made on a broad front: in the provinces of Medical Science⁴ and the Philosophy of Religion⁵ as well as in the visual arts. In the province of Architecture, which was the master art of the time and place,

'this sudden development seems to have been entirely native within Egypt. It was called forth by two devotions: the acceptance of the dogma that the King was a god and thus deserving of a supreme offering of energies, and the excitement of a new adventure in Art and Technique.'⁶

And, while the piling up of colossal buildings in honour of a god incarnate—an oecumenical monarch who was an object of worship because he was a guarantor of peace through unity—is something that might be interpreted as one of the familiar phenomena of a universal state, on a par with the big buildings of 'the New Empire' of Egypt under the Nineteenth Dynasty and of the Roman Empire in its post-Diocletianic Age,⁷ 'the excitement of a new adventure in Art and Technique' is a mark, not of a temporary rally in a long-drawn-out losing battle against the forces of social disintegration, but of an early stage of social growth. Moreover, the distinctive feature of the pyramids built by pharaohs of the Third and Fourth Dynasties, as contrasted with pyramids of a later age, is not the inordinate physical bulk that they have in common with the fallen colossus of Ramses II at Thebes or with the Baths of Diocletian at Rome, but the beautiful exactness of workmanship⁸ that they have in common with the Parthenon at Athens and with the Green Mosque at Brusa.

On this showing, we are bound, in reconsidering our analysis of the structure of Egyptiac history, to conclude that, whether or not there was a flowering of creativity in the Early Predynastic Age, there un-

¹ See Wilson, *op. cit.*, p. vii.

² See *ibid.*, pp. 39, 44, and 78.

³ Under the first two dynasties the Egyptians were content, with one or two exceptions, to go on using a Sumeric building material in a Sumeric style of architecture, in spite of the fact that in Egypt, in contrast to Shinar, brick was not the only building material within the architect's reach. Though, in Egypt, 'stone was abundant and easy to work' (Wilson, *op. cit.*, p. 50), 'the first significant structure of stone' (*ibid.*, p. 70) was the Third Dynasty Pharaoh Djoser's Step Pyramid at Saqqārah, and 'the stone of this structure was cut into small bricks, laid as if the stone blocks were mud bricks, and panelled in the same way as the previous brick tombs were' (p. 51). The rise from a Sumeroid brick architecture to the climax of an Egyptiac stone architecture in the Pyramid of Khufu was, by contrast, 'astonishingly fast. The first serious stone masonry may have been about 100 or 125 years before Khufu; . . . Djoser's Step Pyramid was about 75 years before Khufu. In that brief span the Egyptians had learnt how to handle tremendous masses of stone. . . . They abandoned the handling of stone as if it were brick and treated the new material for its own qualities of mass and durability. And they learnt how to finish off myriads of blocks with a perfection that presented a single unified mass' (*ibid.*, p. 70).

⁴ See *ibid.*, pp. 56-58.

⁵ *Ibid.*, p. 70.

⁶ See *ibid.*, pp. 58-60.

⁷ See *IV. iv. 638*.

⁸ See Wilson, *op. cit.*, pp. 54-55, citing Edwards, I. E. S.: *The Pyramids of Egypt* (London 1947, Penguin).

questionably was one in the Age of the Third and Fourth dynasties;¹ and then we shall also find ourselves further bound to conclude that, whether or not there was a social breakdown, leading to a Time of Troubles, in the Late Predynastic Age preceding the establishment of the United Kingdom under the First Dynasty, there was unquestionably a breakdown after the running out of the Fourth Dynasty, and a Time of Troubles between this breakdown and the political reunification of the Egyptiac World by a Theban Mentuhotep² circa 2050 B.C. So, after all, we shall not find ourselves able to account for the decline and fall of the Old Kingdom under the Fifth and Sixth dynasties entirely as a belated but eventually inevitable nemesis of wounds inflicted by the Egyptiac Society on its own body in an age before a temporary reprieve had been won for it by the First Dynasty's feat of imposing an oecumenical peace. We shall have to find the chief cause of this decline and fall where we have found it in earlier passages in this Study,³ and that is in the egotism which was the dark reverse side of the Pyramid-Builders' dazzling creativity; for this egotism brought in its train a nemesis that worked itself out in the full light of history.

The official concentration of political power in the hands of a Pharaoh whose practical capacity to transact business could not in truth surpass the limits of the ordinary human nature of this bogus god found its nemesis in a decentralization of power, *de facto*, which Pharaoh might ignore but found himself impotent to arrest. The expenditure of an economic surplus—acquired by a politically united Egyptiac Society through the corporate achievement of systematically reclaiming a Nilotic jungle-swamp—upon building the Pyramids, and then setting apart lavish assignments of land revenues for the maintenance of successive Pharaohs' mortuary cults, found its nemesis in an economic breakdown that conjured penury out of abundance. The dedication of 'a new adventure in Art and Technique' to the perpetuation of a life-in-death for dead pharaohs found its nemesis in the freezing of the living plasma of a new-born Egyptiac style of art into a rigid convention⁴ as swiftly as the lava welling out of the crater of a volcano is frozen in the act of flowing down the mountain's side. And all these divers unhappy consequences of the deification of a human ruler eventually stung Egyptian hearts into a moral revolt against the injustice of a régime of privilege that had been

¹ The cause of this flowering in this age was still a mystery at the time of writing. Wilson, in *op. cit.*, p. 61, raises the questions: 'Did a new government bring into being new ruling classes and therefore new social classes? Did a single government, controlling the land from the First Cataract to the Mediterranean, so improve the economic standard of the nation that there was a newly rich class and a notable increase in population? These are highly important questions, but we cannot answer any of them.' Yet, while these questions remained unanswerable apropos of the history of an Egyptiac 'Old Kingdom', they could be answered in the affirmative apropos of a Roman Empire in Hellenic history and of a Han Empire in Sinitic history, and it could be reported that, in those two cases, in which the answers to Dr. Wilson's questions were known, a *prima facie* promising conjunction of political unity with economic development had not availed to kindle a new flame of creative activity.

⁴ On this point, see Wilson, *op. cit.*, pp. 66-67.

carried to monstrous lengths. In its moral atmosphere the anarchic chapter of Egyptiac history between the dissolution of 'the Old Kingdom' and the establishment of 'the Middle Empire' is much more reminiscent of the Time of Troubles between the breakdown of the Hellenic Civilization and the establishment of the Roman Empire than it is of the interregnum between the dissolution of the Roman Empire and the emergence of Christian Hellenistic societies affiliated to the Hellenic Civilization.

In view of these well-authenticated positive facts, we must abide by our original finding that, in the structure of Egyptiac history, the Age of the Pyramid-Builders is an authentic age of growth, in spite of its being an episode in the life of an 'Old Kingdom' which bears marks of being the universal state of a disintegrating society. We must recognize, in fact, that 'the Old Kingdom' is enigmatically Janus-faced.

X. B (ii) (a), ANNEX IV

THE RELATION, IN RENAISSANCES OF UNIVERSAL STATES, BETWEEN EFFECTIVENESS OF EVOCATION AND DEGREE OF GEOGRAPHICAL DISPLACEMENT

IN a preceding Annex to this chapter,¹ in which we have compared the renaissances of the Sinic and Hellenic universal states, we have found that the renaissance of the Sinic universal state in the main body of the Far Eastern World was remarkably more effective than was the renaissance of the Hellenic universal state in either Western or Orthodox Christendom, and also that, as between these two renaissances of the Roman Empire in the histories of the two Christian Hellenistic civilizations, its renaissance in the shape of an East Roman Empire in the main body of Orthodox Christendom fell less far short than its renaissance in the shape of a Holy Roman Empire in the West fell short of the standard of effectiveness set by the renaissance of the Ts'in and Han Empire in the shape of the Sui and T'ang Empire. These findings suggest, as far as they go—and they are, of course, based on a consideration of only three cases—that the effectiveness of the evocation of an antecedent society's universal state varies in direct ratio with the tenacity of the original universal state in surviving, or with its persistence in rallying, during the death agonies of the moribund society of which it was a tardy political embodiment, and in inverse ratio with the degree of the geographical displacement of the domain of the affiliated civilization, in whose history the renaissance takes place, from the domain of its defunct predecessor.

In Sinic and Far Eastern history the dissolution of the Posterior Han Empire at the turn of the second and third centuries of the Christian Era was ephemerally retrieved during the years A.D. 280–317 by a reunion of the whole of its former territory under the rule of 'the United Tsin'; and, when, thereafter, a nascent Far Eastern Society emerged out of a post-Sinic interregnum, its domain was virtually coextensive with its Sinic predecessor's, even though, within this domain, the Yellow River Basin, which had been the Sinic Civilization's cradle, was now rivalled in importance by a Yangtse Basin which had been incorporated into the Sinic World only in the course of its Time of Troubles and its universal state. In Hellenic and Orthodox Christian history a Roman Empire which had dissolved at the turn of the fourth and fifth centuries of the Christian Era in the West survived till the turn of the sixth and seventh centuries in the central and eastern provinces with a tenacity comparable to the persistence of a temporarily dissolved Sinic universal state in reconstituting itself for a further spell under the auspices of the United Tsin. On the other hand the domain of the Orthodox Christian Society that emerged thereafter out of a post-Hellenic interregnum,

¹ On pp. 649–81, above.

unlike the domain of the Far Eastern Society, was not coextensive with the domain of the antecedent society to which it was affiliated. The cradle of the Hellenic Civilization had been the basin of the Aegean Sea;¹ but for some two hundred years after the emergence of an Orthodox Christendom the whole of Continental European Greece and the Morea, save for a few isolated fortresses, was in the hands of pagan Slav interlopers, while Continental Asiatic Greece and the islands of the Archipelago, though they were inside the Orthodox Christian fold, were playing a subordinate part in the nascent civilization's history. Orthodox Christendom's cradle lay on the Anatolian Plateau, and the antecedent civilization to whose domain it approximately corresponded was not the Hellenic but the Hittite. The only important common ground between a nascent Orthodox Christendom and a pre-Alexandrine Hellas was the coastline and immediate hinterland of the Black Sea Straits—above all, of course, an Orthodox Christian imperial capital at a Constantinople which had once been the Hellenic city-state founded by Megarian colonists at Byzantium. This province of the Hellenic World beyond the Dardanelles had, however, lain outside the original domain of Hellas round the Aegean, and the planting of Hellenic colonies along the coasts of the Dardanelles and the Bosphorus had not begun before the turn of the eighth and seventh centuries B.C.

As for the relations between the Hellenic Civilization and Western Christendom, the earliness of the date of the break-up of the Roman Empire in the West was matched by the extent of the displacement of the cradle of Western Christendom from the Hellenic World's Aegean homeland. The cradle of Western Christendom lay in Gaul, north-west of the Alps and astride the Rhine, in territory that had not been incorporated into the Hellenic World until the eve of the establishment of the Roman Empire; and in the early centuries of Western history the Mediterranean seaboard of Gaul in Provence and Languedoc, which had been won for Hellenism by Roman arms a century earlier than the interior and had been penetrated, long before that, by Hellenic influences radiating from Marseilles, played no more important a part than was played in Orthodox Christian history by a *ci-devant* Roman province of Asia that had become the East Roman Empire's Thracian army-corps district.

We have now to inquire whether the historical 'law' which we have inferred from a synoptic examination of these three cases stands or falls if we bring into the picture the other cases known to us. In another context² we have classified fifteen 'related' civilizations³—reckoning the offshoots of the Far Eastern and Orthodox Christian civilizations separately from their main bodies—on the criterion of the degree of their geographical displacement from the antecedent societies to which they are affiliated. Does this widening of our horizon discredit or vindicate our tentative 'law' to the effect that the evocation of the ghost of an antecedent civilization's universal state in the history of an affiliated

¹ See IX. viii. 419 and 711-12.

² In I. i. 132.

³ The Sinic Civilization should be added to this list if we are right in concluding, in the light of the progress of archaeological discovery since the time when the first six volumes of this Study were being written, that this Sinic Society had a predecessor in the shape of the Shang Culture.

civilization varies in its effectiveness in inverse ratio to the degree of the geographical displacement of the affiliated society's cradle from its predecessor's? If we now go on to complete our survey, we shall find our tentative 'law' vindicated on the whole.

For example, in the history of the offshoot of the Far Eastern Civilization in Japan, on ground lying right outside the domain of the antecedent Sinic Civilization, even at its widest extent, a ghost of the Sinic universal state that had been successfully resuscitated in the main body of the Far Eastern Society in the shape of the Sui and T'ang Empire was duly introduced into Japan *tel quel*; but, as we have seen,¹ this unimaginatively exact replica of the T'ang régime was too exotic a plant in Japan to strike root there effectively; and accordingly a resuscitation of the Han régime that was against nature even in China was soon reduced in Japan to a political façade thinly masking a free play of native Japanese political forces on original lines of their own.

The offshoot of Orthodox Christendom in Russia resembled the offshoot of the Far Eastern Civilization in Japan in lying right outside the geographical limits of the antecedent civilization, even at their widest; and here Moscow's claim to be 'the Third Rome'² was not belied by her performance so conclusively as Kyoto's claim (if ever made) to be 'the third Ch'ang Ngan'. Yet, though a Muscovite Tsardom was a more effective avatar of the Roman Empire than a Western 'Holy Roman Empire' ever contrived to be, the native Russian element in its *éthos*, which was the source of its vitality, made it a much less exact replica of its Roman model than was reproduced in an East Roman Empire which had retained the authentic 'Second Rome' to serve as its own imperial capital.

If we pass on to take a synoptic view of the two Islamic societies affiliated to the Syriac Civilization, we shall find our 'law' holding good here again. In an Arabic Muslim World whose cradle included Syria itself, a reintegrated Syriac universal state, in the shape of an 'Abbasid Caliphate, was revived, in a beleaguered fortress which had Syria for its glacis and Egypt for its donjon, within less than three and a half years after the extinction of the original 'Abbasid Caliphate in its residual metropolitan territory in 'Irāq.³ On the other hand, in an Ottoman extension of the Iranic Muslim World into Anatolian territory that had not been embraced in the domain of the Syriac Civilization at any time since its inclusion, from 547 B.C. to 334 B.C., in the dominions of the Achaemenian Empire, the Caliphate enjoyed so little prestige that, as we have seen,⁴ Sultan Selīm I, the Ottoman conqueror who overthrew the Egyptian Mamlūk power and annexed its dominions, never took the trouble to usurp the title of Caliph from the last scion of the Mamlūks' Cairene 'Abbasid puppets; and Istanbul's potential claim to be 'the Third Baghdad' was not exploited by Ottoman statesmanship till the rapid break-up of the Ottoman Empire after the Great Russo-Turkish War of A.D. 1768-74 moved the Porte to bring its dusty title to the Caliphate out of its muniment room as a long-neglected political asset which might perhaps be used to offset the Ottoman Empire's grievous

¹ In II. ii. 158-9.

³ See VI. vii. 20.

² See VI. vii. 31-40.

⁴ In VI. vii. 21-27 and on p. 103, above.

losses of territory and power by helping to preserve some residue of Ottoman political influence over former Muslim subjects of the Porte who had now passed under non-Muslim rule, and to extend this influence over other Muslims, likewise living under non-Muslim rule, who had never at any time been subjects of the Ottoman Empire, even at its widest extent.

We can see, again, that the régime of the Kassite barbarian kings and their indigenous successors, in a Babylonia that was coextensive with an antecedent Sumeric Civilization's cradle in the Land of Shinar, ran much truer to the type of the Empire of Sumer and Akkad, which had been the Sumeric Civilization's universal state, than did the régime of a Hittite barbarian Empire of Khatti on an Anatolian Plateau that had been only on the fringe of the Sumeric World even at the Empire of Sumer and Akkad's apogee.

While our 'law' has thus stood the test of an empirical survey so far, there is at least one case in which the 'law' seems to break down. In the history of a Hindu Society whose cradle was as nearly coincident with an antecedent Indic Civilization's as the Far Eastern Society's cradle was with an antecedent Sinic Civilization's, we should expect to find some avatar of the Mauryan Empire comparable in effectiveness to the Sui and T'ang avatar of the Ts'in and Han Empire; but an inspection of Hindu history reveals no political renaissance of the kind.¹

As for the histories of the sister societies affiliated to the Minoan Civilization, we should expect an Hellenic World whose cradle partially coincided with the Minoan World's to be the scene of an avatar of 'the thalassocracy of Minos' to which we should find no such effective counterpart in a Syriac World whose cradle lay completely outside the bounds of the Minoan World, even at its widest extent, save for the Minoan settlement at Ugarit on Ras ash-Shamrah. Actually we do find something that might be taken for a Syriac avatar of 'the thalassocracy of Minos' in the maritime predominance of the Phoenicians in the Mediterranean in the archaic age of Syriac and Hellenic history, while, on the other hand, no such avatar is to be found in Hellenic history. The thalassocracy in the Aegean Basin that was established by Athens in the fifth century B.C. shows no trace of having been the ghost of a dead Minoan universal state. This abortive Athenian first attempt at the creation of an Hellenic universal state shows all the signs of having been an original response to a contemporary challenge.²

On this showing, we must conclude that the 'law' which we have been examining in this Annex holds good in a majority of the cases in point, but is by no means universally valid.

¹ This non-conformity of Hindu history to our tentative 'law' would be offset by the conformity of Sinic history, if the Sinic Society should prove to have been affiliated to a predecessor in the shape of the Shang Culture; for the cradle of the Chóu barbarians, whose overthrow of the Shang Power gave the Sinic Civilization its opportunity for coming to birth, lay in 'the Country within the Passes' in the Middle Basin of the Yellow River (see VI. vii. 170), not within the homeland of the Shang Culture in the Lower Basin of the Yellow River, and we have noticed (on p. 682, above) that the Chóu Empire wears the appearance of being, like the Khatti Empire and 'the Holy Roman Empire', an attempt, though a clumsy one, to resuscitate the universal state of a defunct antecedent civilization.

² See IX. viii. 435-6 and 522-5.

X. B (ii) (d), ANNEX I

ARE THE RELATIONS OF THE FINE ARTS
AND THE MATHEMATICAL AND NATURAL
SCIENCES TO THE SOCIAL MILIEU DIVERSE
OR SIMILAR?

IN the chapter to which this Annex attaches,¹ we have taken, in passing, a synoptic glance at the relations in which three varieties of human activity stand respectively to a social milieu—located in some particular time and place—which is the field of all these three activities alike; and we have formed the opinion that the relation is a different one in each of the three cases.

While activities in the realm of social human affairs, as exemplified in Politics and in Law, would manifestly be stultifying themselves if they did not try to provide parochial and ephemeral solutions for social human problems that are nothing if not local and temporary, activities in the realm of Non-Human Nature, as exemplified theoretically in Mathematics and in Natural Science and practically in Technology, would be stultifying themselves no less signally if they did not extend their view backwards and outwards beyond the narrow and fleeting bounds of Here and Now to take account of the whole sum of knowledge and 'know-how' accessible to their professors and practitioners. On the other hand, the Fine Arts, as exemplified in Literature and in the Visual Arts, enjoy a relative freedom from the trammels of Time and Space in virtue of their source in the subconscious abyss of the Psyche; for 'the Primordial Images' which the Arts translate into the temporary and local symbolism of some particular social milieu had known 'no variableness, neither shadow of turning',² during the five or six thousand years within which human societies of the species labelled 'civilizations' had been coming and going down to the time of writing, half-way through the twentieth century of the Christian Era; and therefore the oracles, drawn from this unvarying subterranean source, which it was the mission of the Fine Arts to deliver to intelligences and wills domiciled in the kaleidoscopic social milieux on Life's conscious volitional surface, were not only independent of the particular Here and Now in which any system of government or law was bound to be imprisoned, but were likewise free from the hardly less narrow confines of a cumulative intellectual inheritance which was the social prison-house of Mathematics, Natural Science, and Technology.

In the history of Modern Western thought the difference between the respective relations of the Fine Arts and the Mathematical and Natural Sciences to the social milieu was brought out in the course of the seventeenth-century controversy in France and England over the respective merits of 'the Ancients' (i.e. the creators and exponents of

¹ Pp. 48-82 above.

² Jas. i. 17.

the Hellenic culture, seen through the medium of the surviving works of Classical Greek and Latin literature and art) and 'the Moderns' (i.e. the representatives of a Western culture in transition from its Early Modern to its Late Modern phase). Both parties to this debate perceived that the Fine Arts were, for some reason,¹ exempt from the necessity—or debarred from the opportunity—of progressing by a process of cumulative growth which was the servitude—or privilege—of Mathematics, Natural Science, and Technology; and the more temperate and judicious spirits among the champions of the Moderns' cause made a virtue of conceding this point to their opponents. It was frankly admitted by Fontenelle, for example, in *Une Digression sur les Anciens et les Modernes*:²

'Pour ce qui est de l'Éloquence et de la Poésie, qui sont le sujet de la principale contestation entre les Anciens et les Modernes . . . je croi que les Anciens en ont pû atteindre la perfection, parceque . . . l'Éloquence et la Poésie ne demandent qu'un certain nombre de vûes assez borné, par rapport à d'autres arts, et elle[s] dépendent principalement de la vivacité de l'imagination.³ Or les hommes peuvent avoir amassé en peu de siècles un petit nombre de vûes, et la vivacité de l'imagination n'a pas besoin d'une longue suite d'expériences, ni d'une grande quantité de règles pour avoir toute la perfection dont elle est capable. . . . Comme l'Éloquence et la Poésie sont assez bornées, il faut qu'il y ait un temps où elles soient portées à leur dernière perfection, et je tiens que, pour l'Éloquence et pour l'Histoire, ce tems a été le siècle d'Auguste. Je n'imagine rien au dessus de Cicéron et de Titelive. Ce n'est pas qu'ils n'aient leurs défauts, mais je ne crois pas qu'on puisse avoir moins de défauts avec autant de grandes qualitez, et l'on sait assez que c'est la seule manière dont on puisse dire que les hommes soient parfaits sur quelque chose. . . .

'Mais la Phisique, la Medecine, les Mathematiques sont composées d'un nombre infini de vûes, et dépendent de la justesse du raisonnement, qui se perfectionne avec une extrême lenteur, et se perfectionne toujours. Il faut même souvent qu'elles soient aidées par des expériences que le hazard seul fait naître, et qu'il n'amène pas à point nommé. Il est évident que tout cela n'a point de fin, et que les derniers phisiciens ou mathematiens devront naturellement être les plus habiles.'⁴

The same concession to the claims of the Ancients in the realm of the Fine Arts was made by the ablest of the English champions of the Moderns, William Wotton, in his *Reflections upon Ancient and Modern Learning*.⁵

¹ The autonomy on the social plane which the Fine Arts enjoyed in virtue of their source in the subconscious abyss of the Psyche was divined intuitively by the Modern Western thinkers of that generation more than two hundred years before 'the Collective Subconscious' was discovered empirically by the cumulative intellectual labours of Modern Western Science.

³ Fontenelle's 'limited number of ideas within a narrow horizon' which are animated by 'the liveliness of the Imagination' are synonyms, in non-technical phraseology, for Jung's 'Primordial Images'.—A.J.T.

⁴ Fontenelle, B. le B. de: *Poésies Pastorales, avec un Traité sur la Nature de l'Eglogue et une Digression sur les Anciens et les Modernes*, 4th ed. (Amsterdam 1716, Etienne Roger), pp. 142, 140, 143-4, and 140.

⁵ See the second edition (London 1697, Leake), pp. 23-24. The first edition of Wotton's book was published in A.D. 1694.

The consensus on this point between the victorious advocates of the case for the Moderns and their discomfited opponents might have been expected to have settled this question, at least, definitively. Yet, between the close of this seventeenth-century *Kulturkampf* and the time at which this Study was being written, some 250 years later, the controversy over this issue had been reopened again from two sides. On the one side Oswald Spengler, in a work published on the morrow of the War of A.D. 1914-18, had put forward the thesis that Mathematics, Natural Science, and Technology, notwithstanding their proud pretensions to be objective, were in fact just as much at the mercy of the influences and exigencies of diverse social milieux as any activities in the realm of social human affairs.¹ On the other hand, Shelley² had won Bury's applause³ for having resuscitated a suggestion—thrown out tentatively, in the course of the seventeenth-century debate, by Charles Perrault, but not taken up by such circumspect advocates of the Moderns' cause as Fontenelle and Wotton—that the Fine Arts did, after all, progressively improve in the same fashion as Mathematics, Science, and Technology.

Spengler's thesis was enunciated by its author in characteristically dogmatic language:

'There is not and cannot be any such thing as Number-in-Itself. There is a plurality of worlds of numbers because there is a plurality of civilizations. . . . The notion of a universally valid Science which is true for all civilizations is an illusion.'⁴

The grain of truth in these misleadingly unqualified statements is the fact that each particular historical way of life or culture is in some sense a whole whose parts are sensitively and subtly interdependent. This truth has presented itself to us forcibly in our study of encounters between societies that are one another's contemporaries.⁵ We have found that, when some single element in one culture is modified by the impact of another culture, the effects of this modification of the assaulted culture in one point are apt to spread through the entire body social and to make themselves felt at points which might seem, at first sight, to have no connexion with the point in which the change has been introduced first. This intimate interdependence has proved, in the light of such convincing evidence, to be so characteristic a feature of the structure of Human Society that it would indeed be surprising if one particular group of activities, represented by Mathematics, Natural Science, and Technology, should turn out to be entirely unaffected by a tendency that appears to be one of the general 'laws' of social life; and we may find ourselves able to come to an understanding with Spengler when we catch him slipping out of his pontifical vestments and condescending to explain to us that the distinctive quality of each individual civilization, on which he has been insisting, is to be interpreted, not as an absolute

¹ See the passage quoted in III. iii. 380-2.

⁵ See IX. viii, *passim*.

difference of essence, but as a gradational difference of emphasis, *habitus*, or penchant.¹

We can, for example, agree with Spengler in holding that the predominant penchant that gives a particular culture its distinctive style may impart to all the men and women who have been brought up in the atmosphere of that culture, whatever the native psychic orientation of each individual may happen to be, a uniform inclination either towards or away from the mathematical, scientific, and technological approach to life, or, short of that, may at least incline them, within the bounds of this broad field of activity in the realm of Non-Human Nature, to address themselves to one branch of Mathematics, Science, or Technology rather than to another. In this sense and within these limits it may be true, as Spengler contends,² that the 'Apollinean' spirit of an Hellenic upbringing would foster a static-minded *Weltanschauung* which, in the province of Mathematics, would find its most congenial expression in Geometry, whereas the 'Faustian' spirit of a Western upbringing would foster a dynamic-minded *Weltanschauung* which, within the same mathematical field of intellectual activity, would find its most congenial expression in Algebra and the Calculus. But of course, in assenting to this more judiciously formulated version of Spengler's proposition, we are admitting nothing beyond the indisputable facts that there are diverse schools or fashions of education (in the widest meaning of that word) and that the uniform impress of any such educational *habitus* is bound to leave its mark on all individual human beings whose fate it may be to be put through that particular cultural mill, even when the penchant of the society into which a particular individual happens to have been born is at variance with that individual's native personal bent. In admitting this much, we are not committing ourselves to the nonsense implicit in the pontifical version of Spengler's thesis, in which the philosopher-hierophant goes so far as to assert that 'there is not and cannot be any such thing as Number-in-itself' and that 'the notion of a universally valid Science . . . is an illusion'.

It would, indeed, be as fantastic to suggest that Geometry and the Calculus are diverse, alternative, and incompatible systems of Mathematics as it would be reasonable to say that these are different aspects of one identical object of mathematical study that can properly be called 'Number-in-Itself'. We may go on to observe that the several provinces of this realm of Mathematical Science have been opened up at different times and places by divers members of a single mathematical fraternity whose choices of their particular fields of mathematical research have been always influenced, and sometimes virtually determined, by a mental penchant or *habitus* imparted to the individual mathematician by his social milieu. In going thus far, however, we must be careful to steer clear of the nonsense that Spengler makes of his own thesis when he propounds it in its extreme form; for Spengler is manifestly flying in the face of the facts when he suggests that a pioneer in the realm of Mathematics cannot occupy the whole kingdom simultaneously, but

¹ See Spengler, op. cit., vol. i, p. 156, quoted in this Study in III. iii. 383-4.

² Ibid., pp. 380-3, quoted in III. iii. 388-9.

must evacuate the province of Euclidean Geometry as the price of gaining an entry into the province of a Cartesian Calculus, or alternatively must renounce all hope of mastering the Calculus if he is unwilling to relinquish his hold upon Geometry.

The divers provinces of Mathematics, Natural Science, and Technology that have been successively conquered by the Collective Intellect of Mankind do not stand to one another in the same relation as the divers systems of government or law that succeed one another in the history of a human society. A new ministry, new ruler, new dynasty, new régime, or new state cannot come into power without replacing a predecessor; a new law cannot be enacted without abrogating the law previously in force on the same subject. In short, successively established political and legal institutions cannot coexist side by side. They are mutually exclusive because they are incompatible, and they are incompatible because each of them has, as we have seen, to be geared to the particular circumstances of some local and temporary social situation. There is no room in the dimension of social life for more than one such situation at a time, and therefore there is no room there, either, for more than one institution at a time, since every institution's *raison d'être* is to provide a solution for some social problem here and now. Thus, on the plane of social affairs, all human experience testifies with one accord that

Time, like an ever rolling stream,
Bears all its sons away;
They fly forgotten, as a dream
Dies at the opening day.¹

But a 'law of Sin and Death',² which reigns inexorably in this social human realm of government, legislation, and the rest, has no dominion over the abstract non-human realm of Mathematics. In the struggle for mastery between Time and Man in this bloodless intellectual arena, Man has succeeded in making Time Man's servant instead of allowing Time to make Man Time's victim. The monument of Man's victory over Time here is a Collective Human Intellect's cumulative achievement; and this exception to Time's rule, which Watts overlooked and Spengler ignored, had long since been divined by Fontenelle and been noted by Gibbon.

'The Mathematics are distinguished by a peculiar privilege that, in the course of ages, they may always advance and can never recede.'³

If we are right in thinking that we have now disposed of Spengler's contention that Mathematics are subject to the same law of social relativity as social human affairs,⁴ we may now go on to examine Perrault's contention that the Fine Arts are subject to the same law of cumulative growth as Mathematics.

¹ Watts, Isaac, quoted in I. i. 459.

² Rom. viii. 2.

³ Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, chap. lii.

⁴ This thesis of Spengler's receives short shrift at Collingwood's hands (see Collingwood, R. G.: *The Idea of History* (Oxford 1946, Clarendon Press), pp. 225-6).

While Perrault¹ anticipated Fontenelle and Wotton in conceding that the general superiority which the champions of the Moderns' cause claimed for 'the Moderns' over 'the Ancients' might not be demonstrable in the provinces of Poetry and Eloquence, he made this concession expressly 'for the sake of peace'² and perceptibly against the grain; for Perrault himself was a poet; and, though his poetry was doomed to be judged inferior by all standards, whether 'Modern' or 'Ancient', he was vain enough to fancy that he had a personal stake in the question of the relative merits of 'the Moderns' and 'the Ancients' in the field of his own art. His advocacy of the Moderns' cause in the domain of the Fine Arts was therefore not altogether disinterested, and his argument, ingenious though it might be,³ was eventually exploded by one of the twentieth-century Western scientific achievements of a progress which, in the field of Science, was to vindicate Perrault's championship of the Moderns in the act of confuting the seventeenth-century Western poet on the particular issue which he had most at heart.

Perrault's argument ran as follows:

'Pourquoy, voulés-vous . . . que l'Eloquence et la Poësie n'ayent pas eu besoin d'autant de siecles pour se perfectionner que la Physique et l'Astronomie? Le cœur de l'homme qu'il faut connoistre pour le persuader et pour luy plaire, est il plus aisé à penetrer que les secrets de la Nature, et n'a-t-il pas de tout temps esté regardé comme le plus creux de tous les abîmes, où l'on découvre tous les jours quelque chose de nouveau, et dont il n'y a que Dieu seul qui puisse sonder toute la profondeur? . . . Je pourrois vous faire voir ce que j'avance en examinant toutes les passions l'une après l'autre, et vous convaincre qu'il y a mille sentimens delicats sur chacune d'elles dans les ouvrages de nos auteurs, dans leurs traitez de morale, dans leurs tragedies, dans leurs romans, et dans leurs pièces d'eloquence, qui ne se rencontrent point chez les Anciens. Dans les seules tragedies de Corneille il y a plus de pensées fines et delicates sur l'ambition, sur la vengeance, sur la jalousie, qu'il n'y en a dans tous des livres de l'antiquité.'⁴

These were Perrault's grounds for his contention that there might be a possibility of cumulative achievement in Poetry as well as in Mathematics; and, if there had been any cogency in the minor Modern Western poet's case, his suit would have been won for him by the posthumous support that he received from one of the immortals. In reflecting on the sources of his own inspiration, Shelley once observed⁵ that he had found 'common sources of those elements which it is the province of the poet to embody and combine' in 'the beautiful and majestic scenery of the Earth' and in 'the poetry of Ancient Greece and

¹ Perrault, Ch.: *Parallele des Anciens et des Modernes en ce qui Regarde les Arts et les Sciences* (Paris 1688-96, Coignard, 4 Parts).

² 'Nous concluons, si vous l'avez agreable, que dans tous les arts et dans toutes les sciences, à la reserve de l'Eloquence et de la Poësie, les Modernes sont de beaucoup superieurs aux Anciens, comme je croy l'avoir prouvé suffisamment, et qu'à l'égard de l'Eloquence et de la Poësie, quoy qu'il n'y ait aucune raison d'en juger autrement, il faut pour le bien de la paix ne rien decider sur cet article' (Perrault, op. cit., Part iv, Cinquième et Dernier Dialogue, pp. 292-3).

³ A summary of it will be found in Bury, *The Idea of Progress*, pp. 86-87.

⁴ Perrault, op. cit., Part ii, Troisième Dialogue, pp. 29-31. Cp. p. 294 and Part iii, Quatrième Dialogue, pp. 23, 155, and 279.

⁵ In his Introduction to *The Revolt of Islam*, composed in A.D. 1817.

Rome and Modern Italy and our own country', which had been to him, 'like External Nature, a passion and an enjoyment'; and this personal experience suggested to Shelley's mind that

'in this sense there may be such a thing as perfectibility in works of fiction, notwithstanding the concession, often made by the advocates of human improvement, that perfectibility is a term applicable only to Science.'¹

In endorsing a suggestion which Shelley had thus thrown out in passing, Bury drew out the implications of Shelley's argument in the following terms:

'In other words, all the increases of human experience from age to age, all the speculative adventures of the Intellect, provide the artist in each succeeding generation with more abundant sources for aesthetic treatment. As years go on, Life in its widest sense offers more and more materials "which it is the province of the poet to embody and combine". This is evidently true; and would it not seem to follow that Literature is not excluded from participating in the common development of Civilisation?'²

Bury's expansion of Shelley's argument is a legitimate interpretation of Shelley's words which would assuredly have been certified as correct by the poet himself if he could have lived to read Bury's book. Yet, in invoking Poetry in the same breath as External Nature, and describing their effect on his soul as being 'passion' and 'enjoyment', Shelley was unconsciously testifying that the sources of the Wild West Wind that was his tempestuous inspiration were, not 'the speculative adventures of the Intellect', but 'the Eternal Deep' from whose Primordial Images Wordsworth derived his intimations of Immortality. From the same testimony it could be divined that the tale of the years that it had taken 'Life in its widest sense' to accomplish Psyche's task of accumulating the 'materials' for the fund of experience on which every inspired poet drew amounted to an aeon of an utterly different order of magnitude from the brief span of some twenty-six centuries or thereabouts that was the extent of Shelley's own chronological distance from the anonymous authors of an Homeric Greek Epic which was the chronologically remotest poetry within Shelley's conscious ken. The 'passion' and 'enjoyment' that were kindled in Shelley's soul by the works of his brother poets did not find their fuel in any 'increases of human experience' during the few thousand years within which a few representatives of the recently created species of Human Society labelled 'civilizations' had been rising and falling. It would be as fantastic to look for the sources of any great poet's inspiration there as it would be to fancy that a blast-furnace could have been stoked with the contents of a charcoal-burner's basket. 'The visionary gleam' of which the poet catches his beatific glimpse in External Nature and in the poetry of his brother poets alike is the glow of a spiritual fire fed by mighty coal-seams that have been slowly compacted in the womb of Mother Earth out of the debris of forests deeply buried there countless ages ago.

¹ Shelley, *ibid.*, in a footnote.

² Bury, *The Idea of Progress*, p. 124.

A thousand ages in Thy sight
 Are like an evening gone,
 Short as the watch that ends the night
 Before the rising Sun.

No doubt, in God's sight, the aeons in which the human historian has to reckon the longevity of the Human Psyche's primordial abyss will approach no nearer than the brief annals of recorded human history to being comparable with an Eternity with which all Time is incommensurate and into which none of God's creatures can ever enter without being first transfigured by God's grace; yet it is neither inaccurate nor impious to ascribe a godlike timelessness to a subconscious underworld of the Psyche that is merely one of God's creatures, when we find ourselves impotent to plumb the thoughts of 'the human heart by which we live', or to compass the range of 'an eye that hath kept watch o'er Man's mortality', by applying to the Primordial Images the yard-measure of the Intellect. The surface of a planet which in God's sight may loom no larger than an orange would appear to be of an infinitely vast extent to the mind of any human surveyor who set out to measure the Earth's circumference with a measuring-rod of the dimensions of a match.

If these considerations move us to reject Perrault's thesis as well as Spengler's, we shall be confirmed in our acceptance of Fontenelle's and Gibbon's thesis that it is the privilege of Mathematics, Natural Science, and Technology to be capable of progress on a Time-scale set by the pace of the conscious Intellect, and the privilege of the Fine Arts to be exempt from a servitude to Time which is the price of a capacity for cumulative achievement. We shall also be able to repay part of our debt to Fontenelle by underpinning his intuition with one of the empirical discoveries made by Science in the course of its progress between Fontenelle's day and ours. For, within the quarter of a century that had elapsed between the year in which Bury had endorsed Shelley's tentative approval of Perrault's argument and the year in which the present lines were being written, Jung had demonstrated that the Fine Arts draw their inspiration from creative depths of subconscious experience at which, on the Intellect's Lilliputian scale of time-reckoning, there 'is no variableness, neither shadow of turning',¹ in the ageless presences of the Primordial Images.

¹ Jas. i. 17.

‘CLASSICAL’ LANGUAGES AND LITERATURES

THE most striking point about the usage of any language or literature that has been canonized as ‘classical’ is that it is not the mother tongue of any of the members of the society in which it is being cultivated in virtue of having been given this status; and this salient feature of ‘the classics’ is as characteristic as it is prominent; for a ‘classical’ language or literature is *ex hypothesi* a ‘dead’ one which has been brought back to life artificially through the deliberate and selfconscious cultural achievement of a renaissance.

In the polyglot population of the Western World, for example, there was no people whose mother tongue was Ancient Greek or Latin at the time of the literary renaissance of Hellenism at the beginning of the Modern Age of Western history. The Romance-speaking Western peoples, whose mother tongues were derived from Latin as a matter of philological fact, were just as incapable of understanding, speaking, or reading Latin by the light of nature as were their fellow Westerners whose mother tongues were twigs of the Celtic, Teutonic, Slavonic, or Letto-Lithuanian branches of the Indo-European family of languages; and those Western peoples whose non-Indo-European mother tongues—Basque, Magyar, Estonian, and Finnish—had not even the remotest linguistic affinity with either Latin or Greek showed no less enthusiasm than was shown by their Indo-European-speaking neighbours for a revival of the study of the Hellenic literature in the original Greek, as well as in an imitative Latin, which became one of the common cultural enterprises of the Western peoples in and after the fifteenth century of the Christian Era.

The same point comes out in a survey of the currency of other classical languages and literatures in other societies. In an Arabic Muslim World a Classical Arabic language and literature were cultivated by peoples whose mother tongues were varieties of the Berber form of Hamitic speech, as well as by those whose mother tongues were dialects of a current vernacular Arabic. In an Iranic Muslim World both a Classical Arabic and a Classical Persian language and literature were cultivated by peoples whose mother tongues were members of the Turkish and Indo-Aryan families, as well as by peoples whose mother tongues were Irano-Aryan vernaculars linguistically akin to Classical Persian. In a Hindu World a Classical Sanskrit language and literature were cultivated by Indians whose mother tongues were members of the Tamil and other non-Indo-European families, as well as by Indians whose mother tongues were Indo-Aryan vernaculars of Sanskrit origin. In a Far Eastern World a Classical Sinic language which had been standardized (for the eye, though not for the tongue and ear) by Ts’in She Hwang-ti, the founder of the Sinic universal state, and which had consequently

become the exclusive vehicle for conveying the Confucian classics, was cultivated, as the key to the classical literature which it enshrined, by peoples whose mother tongues were Korean and Japanese, as well as by peoples whose mother tongues belonged, as Annamese belonged, to the Sino-Siamese family, or were actually derived, as the latter-day Chinese spoken vernaculars were, from the particular language belonging to the Chinese branch of the Sino-Siamese family which had been canonized as 'classical'.

When we extend our survey to languages and literatures that were cultivated as 'classical' by civilizations of the second generation, the same picture presents itself again. In a Babylonian World the Classical Sumerian language and literature, like their Classical Greek counterparts in the Modern Western World, were cultivated by peoples whose diverse mother tongues—in this case, Semitic, Elamite, and Urartian—had in common the single negative characteristic of having no affinity with the language that had been canonized as 'classical'; and the Classical Akkadian language and literature, that were parasites on the Sumerian as the Latin were on the Ancient Greek, were cultivated, side by side with the Sumerian, by the non-Semitic-speaking Elamite and Urartian peoples of the Babylonian World as well as by the speakers of Babylonian and Assyrian Semitic vernaculars of Akkadian origin. The same Classical Sumerian and Classical Akkadian languages and literatures were likewise cultivated in a polyglot Hittite World whose peoples' Asianic and Indo-European mother tongues had no affinity with either Sumerian or Akkadian. We may also observe that in the corpse of an Egyptian body social which was galvanized into a long-drawn-out life-in-death by the repeated stimulus of successive stabs administered by a series of alien intruders—Hyksos, Assyrians, Persians, Hellenes—a Classical Egyptian language and literature were cultivated, until the advent of Christianity, not only by latter-day Egyptians whose mother tongue was of Classical Egyptian origin, but also by Libyans whose mother tongue belonged to a different branch of the Hamitic family and by polyglot Ethiopians among whom an earlier Hamitic-speaking stratum of population had been partly submerged under successive waves of invaders from the heart of Tropical Africa whose mother tongues were not akin to Classical Egyptian even remotely.¹

Thus, wherever we find any language or literature being cultivated as classical, we almost invariably² also find that it is current in this classical usage among people who do not speak this language, or any language derived from it, as their mother tongue. Yet this trait, though almost invariably present, is nevertheless not a distinctive hall-mark that can be taken as the differentia of languages and literatures that have become 'classical'; for there are other categories, besides, in which the self-same feature presents itself. *Lingue franche*,³ the official languages of

¹ See II. ii. 114-15.

² 'Invariably' has to be qualified by 'almost', in view of the fact that, in Orthodox Christendom, the revival and cultivation of Ancient Greek as a classical language was virtually confined to Modern-Greek-speaking Orthodox Christians. A possible explanation of this exception to what seems to be the general rule is offered on pp. 713-17, below.

³ See V. v. 483-527.

universal states,¹ and the liturgical languages and literatures of universal churches² are three categories which share with 'classical' languages and literatures the characteristic of being cultivated by peoples who have not inherited them as their mother tongues; and we must look farther for the points of difference that distinguish 'classical' languages and literatures from these.

One such point of difference is that, whereas a classical language or literature is, by definition, a ghost that has been raised from Sheol after a *vitai pausa*³ during which it has not been current, a *lingua franca* or an official language or a liturgical language or literature must have been, not merely alive, but aggressively radioactive, at the time when it won its status, and must also have maintained and preserved this status, after winning it, without any break of continuity from the beginning to the end of its career. These common characteristics of a *lingua franca*, an official language, and a liturgical language or literature, which a classical language or literature does not share with them, all derive from the fact that languages and literatures in these three categories are propagated by 'men of action'—merchants, empire-builders, deportees, or missionaries, as the case may be—to meet the practical needs of some current form of intercourse between contemporaries such as trade or administration or communal worship, whereas classical languages and literatures are propagated by scholars whose purpose is to enrich the culture of the society into which they have been born by making accessible in their own world the cultural treasures of an antecedent civilization which, in their belief, are superior to their own society's corresponding native products.

This distinction between a practical-minded utilitarianism and a scholarly-minded idealism must not, however, be pressed too far; for on a closer scrutiny we shall find that it is not a difference of kind but is merely one of degree. A scholar who would repudiate any suggestion that he was animated by a 'utilitarian' purpose would be equally unwilling to admit that his activities were useless; and in a previous context⁴ we have already noticed that a ghost is never evoked simply for its own sake; the necromancer is always moved to act by the practical motive of seeking, through the exercise of his black art, to find a solution for some pressing current problem in the life of his own society. Moreover, when a ghost has been successfully raised, this *jinn* is apt to make the fortune of the magician who has enslaved him. A classical education has frequently been the passport to an eligible career in the administrative service of a state. In the Far Eastern World, Greek Orthodox Christendom, and the Arabic Muslim World, a proficiency in the Sinic, the Ancient Greek, and the Classical Arabic language and literature respectively was the indispensable qualification for enrolment in the imperial civil service of a resuscitated universal state,⁵ while in the Iranic, Early Hindu, and Modern Western worlds the administrators of parochial states were similarly recruited from candidates whose qualification

⁴ On pp. 119-20, above.

⁵ The three universal states here in question were, of course, the Sui and T'ang Empire, the East Roman Empire, and the Cairene 'Abbasid Caliphate.

was a proficiency in the Arabic, Persian, Sanskrit, Ancient Greek, and Latin classical languages and literatures.

The canonized dead language, which thus opens the door to a career in the public service in the political life of a society which has taken to cultivating this element of an extinct antecedent culture, may once have served as an official language of the antecedent civilization's universal state. The Ancient Chinese language that had been standardized visually by Ts'in She Hwang-ti had subsequently served as the official language of the Empire of the Ts'in and Han before being given the status of a classical language in a latter-day Far Eastern World. Latin and Ancient Greek had served as the official languages of the Roman Empire before Ancient Greek in Orthodox Christendom, and both Ancient Greek and Latin in the Western World, were canonized and cultivated as classical. Sumerian and Akkadian had served as the official languages of the Empire of the Four Quarters, from the days of its Sumerian founder Ur-Engur (*alias* Ur-Nammu) of Ur down to the days of its Amorite restorer Hammurabi of Babylon, before becoming classical in the eyes of a latter-day Babylonian Society. A Sanskrit that had been brought back into currency in an Indic World by a feat of linguistic archaism¹ had subsequently served as the official language of the Guptan Empire before being adopted as classical by a latter-day Hindu Society.

This use of a language as the official language of a universal state can never overlap chronologically with its eventual apotheosis as a classical language in the life of an affiliated society, since a universal state is always carried to destruction in the final dissolution of the disintegrating society that, in its last phase, has come to be embodied politically in an oecumenical empire of this type,² and therefore a language that has once served as the official language of a universal state is bound to have lost this function before gaining the status of a classical language as the result of a linguistic and literary renaissance in the life of an affiliated society that has come to birth eventually after a social interregnum. On the other hand the use of a language as the liturgical language of a universal church may well overlap chronologically with the use of the same language as a classical language canonized in a renaissance, since a church, unlike a universal state, is apt to survive the social interregnum between the dissolution of an old civilization and the emergence of a new one;³ and there are in fact a number of instances of the simultaneous cultivation of the same language in these two different roles. Cases in point are the simultaneous currency of Sanskrit as the liturgical language of the Hindu Church and as the classical language of the Hindu Civilization; of Arabic as the liturgical language of the Islamic Church and as a classical language of the Arabic and Iranic Muslim civilizations; of the standardized visual form of Ancient Chinese as the liturgical language of the Taoist and Far Eastern Mahayanian Buddhist churches and as the classical language of the Far Eastern Civilization; of Ancient Greek as the liturgical language of the Greek Orthodox Christian Church and as the classical language of Modern-Greek-speaking Orthodox Christians; and of

¹ See V. vi. 75-77.

² See I. i. 53 and VI. vii. 1-379.

Latin as the liturgical language of the Western Catholic Church and as one of the two classical languages of the Western Civilization.

In some of these cases this simultaneous use of the same dead language in two different roles did not produce any sense of incongruity and therefore did not generate any cultural friction. No effect of the kind followed from, for example, the dual role played by Arabic, since the liturgy of the Islamic Church and the secular Arabic literature that came to be canonized as classical had a common fountain-head in the Qur'ān.¹ The dual role of Sanskrit was likewise eased by a pre-established harmony, since the Sanskrit epic had been transfigured, long before it had become one of the classics of the Hindu World, into one of the holy scriptures of Hinduism, and this not merely through the interpolation of the *Bhagavad Gītā*, but through a permeation of the secular native substance of the *Mahābhārata* by a religious leaven.² In the Sinic and Hellenic worlds, as in the Indic World, the secular language and literature that were eventually to be canonized and cultivated as classical in the latter-day life of an affiliated civilization had already been going concerns before the epiphany of a universal church in the underworld of an internal proletariat; but in these cases the church was either unable or unwilling, or both unable and unwilling, to swallow an existing secular literature and digest it.

A nascent church did, nevertheless, in both these cases, adopt the language or languages in which the existing secular literature had been written, since in the Sinic World at the time of the epiphany of the Mahayanian and Taoist churches and in the Hellenic World at the time of the epiphany of the Christian Church even the most militant 'futurist' innovator would never have dreamed of using any language but Ancient Chinese in the one case and Ancient Greek and Latin in the other case as the medium for any serious literary work, either secular or religious; and, if a Buddhist, Taoist, or Christian missionary had attempted to boycott languages that were current, not only as vehicles of an ancient and revered secular literature, but also as *lingue franche*, he would have defeated his own purpose by eschewing the only linguistic media that were both universally familiar and universally esteemed in his day in the world that was his mission-field. But, when a church thus found itself constrained to use a current oecumenical language as its literary vehicle without being able or being willing, as the case might be, to capture, appropriate, and transfigure the secular literature that had already been written in this language either in its current form or in some older dialect, the inevitable result was the production of a new corpus of religious literature—a liturgy, holy scriptures, commentaries on the scriptures, and treatises on theology—in rivalry with the already existing corpus of secular literature in the same language.

¹ It is true that the Qur'ān was not the only source of a subsequent secular Arabic literature's inspiration. It was also inspired in part by a pre-Islamic lyric poetry that was one of the spontaneous cultural products of an heroic age of the Arab transfrontier barbarians adjoining the Syrian *limes* of the Roman Empire (see V. v. 234). The Qur'ān itself, however, had already drawn inspiration from this same pre-Islamic source; so there was no clear-cut division between a pagan source of an Arabic used in a secular Arabic literature and an Islamic source of an Arabic used in the Islamic Church's liturgy.

² See V. v. 596-9 and 604-6.

The consequent coexistence of two competing literatures in the same language was bound to cause friction between their respective votaries, and such friction duly made itself felt when this situation arose in a moribund Sinic World in the Age of the Posterior Han and in a moribund Hellenic World in the Age of the post-Diocletianic Roman imperial régime. Thereafter, when a once dominant minority by whom the secular literature had been kept alive had been wiped out, as it was in the former domain of the Hellenic Civilization, or, short of that, had been driven into a corner, as it was in the former domain of the Sinic Civilization,¹ the friction diminished as the cultivation of the secular literature dwindled towards vanishing point, leaving the religious literature temporarily in almost unchallenged possession of the field; but, if and when a neglected and half-forgotten secular literature recovered its vitality through a renaissance of it in the history of an affiliated civilization—as happened in the Far Eastern World in and after the Age of the T'ang, in Greek Orthodox Christendom in and after the generation of Photius, and in the Western World in and after the fifteenth century of the Christian Era—the friction was bound to recur.

In its recurrence as the sequel to a renaissance, as well as in its original occurrence in the last days of an antecedent civilization, this friction between two literatures conveyed in one language was apt to be accentuated by any appreciable difference of nuance between the particular forms of the common language in which the secular literature and the religious literature were respectively embodied. We have already noticed² that, in Greek Orthodox Christendom by the fifteenth century of the Christian Era, when a school of Byzantine imitators of Hellenic historians had been at work for not much less than four hundred years, at least two of their number had become sensitive to the difference between a post-Alexandrine Attic *κωμῆ* and the undiluted Attic Greek of a Thucydides and Ionic Greek of an Herodotus; and, although, as we have also seen, a Khalkokondhýlis and a Kritópoulos flew ambitiously higher than a Léon Dhiakónos or a Nikítas Khoniátis, only to fall ludicrously lower, their dawning glimmer of a finer aesthetic sense lit the way for more sure-footed Italian and Transalpine Western followers in these Greek Orthodox Christian pioneers' shambling footsteps. So far from coming to grief, these Modern Western literary mountebanks achieved an amazing virtuosity in keeping their precarious footing on a slippery path, thanks to an infinite capacity for taking pains which a nineteenth-century Western vernacular poet was to immortalize in his fantasy of *A Grammarian's Funeral*. But, the more accurately these Western Humanists performed their self-imposed *tour de force* of aping the styles of Ancient Greek and Latin classical authors, the more exquisitely were their over-refined aesthetic sensibilities excruciated by the barbarism of a 'Low Latin' that was the sacrosanct language of the Vulgate version of the Bible, the Roman liturgy, and the works of the Latin Fathers of a Western Catholic Christian Church.

¹ Joannes Petrus Maffeus, S.J., (*vivebat* A.D. 1536–1603) was one of the

¹ See VI. vii. 357, n. 4, 367, and 370–2; and pp. 649–81, above.

² On pp. 60–61, above.

best of the Jesuit writers. He wrote in Latin, and prided himself on the purity and elegance of his style. His two principal works are *Historiarum Indicarum Libri XVI* (Florence 1585) and *Vita Ignatii Loyolae* (Venice 1585). The first of these took twelve years to complete; but, as the author is said to have spent hours, even days, in modelling a single sentence, the wonder is that he ever did complete it. So great was Maffeus's reverence for *la belle Latinité* that he used to repeat his breviary in Greek, so as to avoid contaminating his style.¹

This sixteenth-century extravaganza was surpassed by the pedantry of at least one nineteenth-century Western scholar who succeeded in sharpening his sensibilities to a still finer point. When the writer of this Study first went up to Oxford as an undergraduate in the autumn of A.D. 1907, one of the tutorial fellows of his college, who had by then devoted the best part of a lifetime to the hot-house cultivation of *Litterae Graecae et Latinae*, was alleged to have refined his taste to such an exquisite degree that he had eventually rendered himself incapable of enduring the torture which he had diligently trained himself to suffer from reading even the common run of 'classical' pagan Greek and Latin authors, not to speak of a 'post-classical' Christian Greek and Latin literature. By the year 1907 this scholar was reported to have carried his progressive mental self-mutilation to an extreme at which the only authors in any tongue that he could any longer bear to read were four Latin poets, namely Virgil, Horace, Ovid, and the humanist-fakir himself. For fear of forgetting one day to slip a printed copy of one or other of the first three of these still unproscribed classics into his pocket, he used to inscribe Latin verses of his own composition on his shirt-cuffs as an iron ration to insure him against the risk of dying of aesthetic starvation. The fate that did overtake him was the sadder one of mental inanition.

The irreconcilably divided spiritual allegiance of a less fanatically humanist Maffeus betrays the tension between a would-be *revenant* Hellenism and its votaries' ingrained Christian spiritual heritage, which, in a tug-of-war for the possession of Maffeus's soul, had demonstrated the tenacity of its grip by drawing this ardent Hellenist into the ranks of a Spartanly disciplined Society of Jesus. The renaissance of a classical language and literature in the history of a civilization which had been hatched out of a chrysalis-church inevitably confronted the humanist—in the West, in Greek Orthodox Christendom, and in the Far Eastern World alike—with the insoluble problem of trying to serve two masters.² The tension thus produced by the resuscitation of a pagan classical literature was, of course, no more of a novelty than was the resuscitated literature itself. In the cases in question, the Fathers of a Christian, a Mahayanian, and a Taoist Church had been caught on the horns of the same dilemma in the last phase of the history of an antecedent civilization, when they had found themselves constrained to conduct their propaganda campaign against an outworn paganism in an irreplaceable pagan

² Matt. vi. 24; Luke xvi. 13.

linguistic and literary medium.¹ When this tension recurs as the result of a renaissance, it may prove, in spite of appearances, to be in this

¹ Unless they were to resign themselves to confining their preaching to the proletariat and renouncing all hope of penetrating the ranks of a dominant minority, the missionaries of the higher religions had to present their case to a cultivated pagan public in a literary guise which readers of this class would find at least familiar, if not congenial. The difficulty of persuading a sophisticated audience to give a hearing to an outlandish gospel would be great enough in any case; and the apostles to 'the high-brows' would have deprived themselves in advance of all prospect of success if they had gone out of their way to antagonize their shy spiritual quarry at the outset by wantonly making the form of their creed as *rébarbatif* as the substance of it could hardly fail to seem to an aesthetically sensitive Hellenically-cultivated mind ('si quando . . . prophetam legere coepissem, sermo horrebat incultus'—Saint Jerome, *Ep.* xxii ad Eustochium, chap. 30). These diplomatic considerations, however, were not the Fathers' only motive, and indeed not even their strongest one, for resorting to the use of a cultural instrument which their church had officially condemned as frivolous at its best and, at its worst, pernicious. The evangelists of a cultivated pagan society were moved to address this audience in its own idiom chiefly because these evangelists themselves were mostly converts from these very pagan circles. Their conversion to an alien proletarian religion had not availed to break the spell of a pagan culture which was their birthright; and, when they used their pagan literary culture for missionary purpose, they were acting, not on calculation in cold blood, but spontaneously, *con amore*.

The abiding value of a pagan culture for Christian converts from a cultivated pagan milieu was demonstrated by the severity of the blow which Julian succeeded in dealing to the Christian community in the Hellenic World of his day by his shrewdly malicious stroke of making a professing Christian ineligible, *ex officio religionis*, for holding a teacher's official licence (see V. v. 682). The Christian victims of this sly manoeuvre in a 'cold' religious war were so hard hit by their exclusion from a pagan field of cultural activity, and were at the same time so well versed in a literature which was the common heirloom of both parties, that, according to the story (as told by Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, chap. xxiii, following Sozomen), Christian men of letters 'had recourse to the expedient of composing books for their own schools. Within a few months Apollinaris produced his Christian imitations of Homer (a sacred history in twenty-four books), Pindar, Euripides, and Menander; and Sozomen is satisfied that they equalled, or excelled, the originals'.

Julian's stroke was a shrewd one because the Christians' unwillingness to dispense with a pagan cultural instrument not only laid them open to a public exposure as hypocrites but also secretly vexed their own consciences and continued to vex them even when Julian was no longer there to taunt them with their inconsistency. At a time when Julian was dead and his Hellenic paganism was moribund, a Saint Jerome suffered the same inward spiritual discomfort from a tension between a Christianity to which he had dedicated himself and a pagan cultural heritage which he had failed to pluck out and cast from him ('bibliotheca . . . carere non poteram'—Saint Jerome, *ibid.*) as a Father Maffius was to suffer, in his day, from a corresponding tension between a Humanism to which he had dedicated himself and a Christianity from which he had found himself unable to break loose. Jerome's psychological conflict came to the surface of his consciousness in the celebrated dream in which he fancied that he was hailed before the heavenly tribunal of Christ; was convicted by his divine judge of being still a Ciceronian and no Christian; and was reprieved only thanks to the intercession of the consistory and in consideration of an oath which he swore by Christ's name, binding himself never to read any profane literature any more: 'si legero, te negavi' (Hieronymus: *Epistulae*, No. xxii ad Eustochium, chap. 30). Paganism had to become not merely moribund but extinct before the Christian heirs of a pagan Hellenic culture could play their part as Hellenism's literary executors with an easy conscience.

This task of cultural conservation, which was thus voluntarily undertaken during a post-Hellenic social interregnum by a Christian clergy, was sometimes thrust upon their Buddhist and Taoist counterparts during a post-Sinic interregnum. 'In A.D. 409, for example, when the eighteen-year-old T'o-pa Ssu ascended his father's throne . . . [as the ruler of one of the barbarian successor-states of a United Tsin imperial régime], he commanded Ts'ui Hao (*vivebat* A.D. 381-450), a rising young scholar who later became famous as the Taoist foe of Buddhism, to give him a course in [Confucian classical] Chinese literature. This course, which took three years, included the Han vocabulary and exercise book *Chi chiu chang*, *The Classic of Filial Piety*, *The Analects*, *The Odes*, *The History*, *The Spring and Autumn Annals*, *The Book of Rites*, and *The Changes*' (Goodrich, L. C.: *A Short History of the Chinese People* (London 1948, Allen & Unwin), pp. 83-84). A convinced Taoist can hardly have relished the *corvée* of giving this command performance in the role of a professor of Confucianism; for, in a nascent Far Eastern World in Ts'ui Hao's day, 'Confucianism was not dead', as Stoicism and Neo-

milieu a superficial antagonism masking a covert co-operation between two ostensibly conflicting cultural forces.

This possibility is indicated by a difference, which we have already noticed in passing,¹ between the respective fortunes of resuscitated classical languages and literatures in the Far Eastern and Western worlds on the one hand and in Orthodox Christendom on the other. We have observed that, when a visually standardized Ancient Chinese classical language and literature were resuscitated in the Far East, and when an Ancient Greek and a Latin classical language and literature were similarly resuscitated in the West, the cultural coin that had thus been brought back into currency came into general circulation in all the linguistic provinces of a Western and a Far Eastern World; but we have also observed that in Orthodox Christendom the circulation of a resuscitated Ancient Greek classical language and literature never spread *proprio motu* beyond the Modern-Greek-speaking province of a polyglot Orthodox Christian World. The Georgian-speaking, Slavonic-speaking, and Rumanian-speaking Orthodox Christians never attempted to appropriate the secular cultural heritage of Hellenism except in so far as they may eventually have taken up the study of the Ancient Greek and Latin languages and literatures as a consequence of their eventual reception of a Modern Western culture on to which those classical Hellenic studies had been grafted by that time as a result of a fifteenth-century Italian Renaissance.

This difference in the respective ranges of the circulation of resuscitated classical languages and literatures within the ambits of the worlds in which they have been conjured back to life becomes intelligible on the hypothesis that a resuscitated classical language or literature finds difficulty in striking root on any ground that has not been prepared for its reception by the survival there of a religious liturgy and literature embodied in the same language. At any rate, it is a matter of historical fact that a Mahayanian Buddhist liturgy and literature conveyed in Sinic characters had already become current in the non-Chinese-speaking as well as in the Chinese-speaking provinces of a Far Eastern World before the reception there of a classical Sinic secular literature conveyed in the same visual medium, and that a Christian liturgy and literature conveyed in the Latin script and language had already become current in the non-Romance-speaking as well as in the Romance-speaking provinces of a Western World before the reception there of a classical Hellenic literature that was likewise conveyed in Latin before the West's reception of Ancient Greek, whereas in the Orthodox Christian World the use of Ancient Greek as a vehicle for a Christian liturgy and literature had been confined to the province in which Modern Greek was the local current vernacular. This conterminousness of the range of circulation of a resuscitated classical language and literature with the range of the same language in its surviving use for ecclesiastical purposes is so regular an occurrence that it cannot be explained away as a fortuitous coincidence;

platonism were in a nascent Western Christendom in Bede's day: 'it was merely quiescent' (Goodrich, *ibid.* Cp. the passage quoted in VI. vii. 372 from Fitzgerald, C. P.: *China, A Short Cultural History* (London 1935, Cresset Press), p. 286).

¹ On p. 705, above.

and the only other possible explanation is that the survival of an otherwise 'dead' language as 'a going concern' for ecclesiastical purposes is an indispensable antecedent condition for the successful recultivation of a 'dead' classical secular literature that has used the same 'dead' language as its vehicle.

On this showing, we must conclude that the linguistic liberality of the Eastern Orthodox Church was as inimical to the eventual cultivation of a classical secular Ancient Greek literature, in those provinces of Orthodox Christendom in which Ancient Greek was not imposed as the local ecclesiastical language, as the Western Catholic Church's illiberal insistence on an oecumenical use of Latin, as the exclusively authorized and uniformly required ecclesiastical language for all spiritual subjects of the Holy See, was favourable to the eventual cultivation of a classical secular Latin literature in all provinces of Western Christendom, whatever the local vernacular might happen to be.¹

It is noteworthy, for example, that the fruits of the renaissance of Ancient Greek linguistic and literary studies at Constantinople in the ninth century of the Christian Era were not disseminated into an adjacent Orthodox Christian Bulgaria, though the Bulgarian Tsar Symeon (*imperabat* A.D. 893-927) had been brought up in Constantinople and had been educated there, not only in a School of Slavonic Studies founded by Photius, but also, apparently, in the School of Hellenic Studies founded by the Caesar Bardas,² where he had acquired a taste for the works of Demosthenes and Aristotle.³ Why was it that a Bulgar autocrat who had become so enthusiastic a Hellenist that he had been nicknamed 'the semi-Greek'⁴ was unable or unwilling to introduce his beloved Hellenic studies into his own country? In this Bulgarian case the answer to our question is ambiguous, since the Bulgarian and East Roman Empires were embroiled with one another by a political conflict⁵ which came to a head in Symeon's day and which would probably have blighted the prospects of Hellenic studies in Bulgaria even if the ecclesiastical language with which a then recently converted Bulgaria had been endowed had been the Greek Orthodox Church's own Attic Greek *κοινή* and not the Macedonian Slavonic dialect that had been equipped with an alphabet and been turned to ecclesiastical account by the Salonican Greek missionary-philologist Saint Cyril.⁶ It is perhaps significant, all the same, that Symeon's cultural work in Bulgaria even at the beginning of his reign, before his political breach with the East Roman Imperial Government, took the form, not of introducing into Bulgaria the study of the Ancient Greek language and literature in the originals, but of translating into the Slavonic a number of Ancient Greek classics, of which the majority were Christian and not pagan works.⁷ The test case, however, is not the Bulgarian case but the Russian.

¹ The contrast between the diverse linguistic policies of the Eastern Orthodox Church and the Western Catholic Church has been noticed in IV. iv. 374-7.

⁵ See IV. iv. 377-91.

⁶ See IV. iv. 376-7.

⁷ See IV. iv. 382, following Runciman, *op. cit.*, p. 139: 'The Presbyter Gregory

In Russia's, in contrast to Bulgaria's, encounter with the East Roman Empire and conversion to Orthodox Christianity, there was no political complication to interfere with the reception of Hellenism in its original Ancient Greek dress by a converted Slavonic-speaking people. The acknowledgement of the East Roman Empire's political suzerainty, which was implicit in a submission to the Oecumenical Patriarchate's ecclesiastical jurisdiction, did not stick in the throats of Varangian princes at Kiev and Novgorod who well knew that their principalities were *de facto* safely beyond the reach of even Basil the Bulgar-killer's long arm. While Bulgaria lay on the East Roman Empire's threshold, Russia was insulated from the East Roman Empire by the twofold physical barrier of the Black Sea and the Great Western Bay of the Eurasian Steppe. The Russians therefore had nothing to fear from exposing themselves *de jure* to an East Roman political pretension which in their case could never have any serious practical effect; and they felt so sure of their political security that in the ecclesiastical sphere they submitted not only to being enrolled among the Oecumenical Patriarch's spiritual subjects but to leaving in this Constantinopolitan Greek prelate's hands the appointment of the local head of the Russian national church, and allowing him to exercise this right of patronage by always installing a Greek in preference to a Russian.¹

The Metropolitans of Kiev were, with only two exceptions, Greek appointees of the Oecumenical Patriarch's from *circa* A.D. 1037/9 until the Kievan Russian World was overwhelmed by the impact of the Mongols in and after A.D. 1237;² during the same two centuries about half the bishops in Russian Orthodox Christendom were Greeks as well;³ and Russia's consequent ecclesiastical intercourse with the East Roman Empire 'was most fertile for spiritual culture'.⁴ Yet in Russia, as in Bulgaria, literature written in Ancient Greek was acclimatized, not in the original, but only in translation; and the range of the Greek works selected for translation into Macedonian Slavonic for the edification of Bulgar and Russian converts to Orthodox Christianity approximately coincided with the contents of 'the library of an average Greek monastery'.⁵ 'At first the main bulk of the translated literature belonged to the Christian Antiquity of the fourth and fifth centuries';⁶ and, though it is true that, of the two or three dozen translations from the Greek which show linguistic signs of having been made before the Mongol conquest of Russia in the thirteenth century of the Christian Era, 'most are the works of secular or half-secular literature',⁷ it is significant that, out of these, only one—Josephus's *History of the Great Romano-Jewish War*—is a non-Christian author's work, and not one a pagan author's, while some of them are not works of the Hellenic Age at all, but are medieval. For instance, a translation of the Medieval Greek Epic—written in a mix-

translated the chronicle of John Malalas, and also a romantic tale of Troy for "the book-loving prince".

ture of Modern and Ancient Greek—whose hero was Digénis (Dhiyéris) Akritas¹ was included in this earliest batch.² As for the secular works subsequently translated from the Greek, these amounted to no more than a tiny fraction of the total bulk of the literature that had been translated by the sixteenth century; and this batch consisted of one Late Hellenic chronicle, one Early Byzantine chronicle, and some fragments of works on grammar and logic. Here again, there is not one pagan Greek classic in the list.

How are we to account for this signal failure of the classical Hellenic literature to strike root in a Russia whose reception of Orthodox Christianity had exposed the Slavonic-speaking converts to the influence of their Greek-speaking co-religionists? In this case, as we have seen, no political obstacle loomed up across the path of cultural intercourse; and by the date of Russia's conversion the literary renaissance of Hellenism in Greek Orthodox Christendom was already in full swing. Why should a Medieval Greek renaissance of Hellenism have failed to capture Russia as a Medieval Italian renaissance of Hellenism eventually captured Hungary, Poland, and Scandinavia? The key to an explanation of this puzzle is perhaps to be found in the practice of translating Greek into Slavonic, instead of studying works of Greek literature in the original; for, notwithstanding the power and prestige enjoyed by the Greek Metropolitans of Kiev,

'the knowledge of Greek seems to have been not much extended among Russians. In the *Chronicles* or in the *Lives* of Saints we never find them speaking Greek, nor is there any mention of the Greek language being taught in schools. What is still more significant, there have been preserved no Greek manuscripts written in Russia, no Greek quotations or even single words in Greek letters in Russian manuscripts. It appears that Greek was for the Russians a language of practical intercourse with foreigners and not an instrument of culture. Studying the theological and scientific fund of the most learned Russian authors, one cannot discover among their sources direct Greek originals. . . . Everything in their writings can be explained on the ground of the existent literature of translations.'³

The formidable intellectual enterprise of mastering Greek had thus been made superfluous for the Russians thanks to the linguistic liberality of the Orthodox Church and the philological ability of Saint Cyril, the Greek Apostle to the Slavs. Yet this exemption from an intellectual labour was a doubtful blessing, since, in being let off a task, these Slavonic-speaking Christians were at the same time being denied an opportunity. If they had been compelled to take Orthodox Christianity in its original Greek dress, a mastery of the Attic Greek *κωνή* in its ecclesiastical use would have provided them with the necessary stepping-stone for mounting to the higher attainment of cultivating the pagan Hellenic literature written in an earlier form of the same Attic Greek dialect, and passing on thence to an Ionic Greek Herodotean prose and an Epic Greek Homeric poetry. A Greek Orthodox Christian who had

¹ See V. v. 252-9.

³ *Ibid.*, pp. 58-59.

² See Fedotov, *op. cit.*, p. 50.

mastered his church's liturgy and literature in the original Ancient Greek could not be confronted with the pagan classical literature written in the same language without finding himself both easily able to understand it and potently affected by its aesthetic charm and its intellectual power; but this ghost of a dead Hellenic literary culture would be impotent to haunt a Slav Orthodox Christian who had contentedly remained ignorant of Greek because all that he needed to know of the Orthodox Christian liturgy and literature had been adequately translated for him out of the original Greek into a dialect of his own Slavonic mother tongue.

Whatever the explanation may be, it is an indisputable fact that, in the Orthodox Christian World, a renaissance of the Ancient Greek language and literature that was both vigorous and persistent in the geographical province within which the Orthodox Christian Church had continued to use Ancient Greek as its literary vehicle failed to make any headway in those provinces in which the Orthodox Christian liturgy and literature were translated out of Greek into Georgian or into Slavonic. On the other hand, this diversity of ecclesiastical languages did not prevent the spread of another resuscitated element of Hellenism which was not a literature but a political institution, and which therefore, unlike the Ancient Greek classics, was not dependent on a linguistic vehicle for its dissemination. In contrast to the ghost of a dead Hellenic literary culture, the ghost of a dead Hellenic universal state in its post-Diocletianic totalitarian last phase did not remain confined within the ambit of a Modern-Greek-speaking province of Orthodox Christendom where it, too, had originally been raised. After having made its first reappearance in the shape of the East Roman Empire, it proceeded, as we have seen, to haunt one after another of the non-Greek-speaking peoples who were successively converted to the Orthodox Christian Religion and Civilization. After Constantinople had seen her pretension to be 'the Second Rome' made good by a Leo III and a Constantine V (*imperabant* A.D. 717-75), she lived to see a Bulgar Symeon in A.D. 925, a Vlach Asen and Cuman Terteri after A.D. 1204,¹ a Serb Stephen Dushan in A.D. 1346, and a Russian Ivan IV in A.D. 1547 each attempt in turn to steal her title from her by inaugurating 'a Third Rome' at Preslav, Trnovo, Skoplje, and Moscow in succession.² Thus, unlike the Byzantine renaissance of the Ancient Greek language and literature, the Byzantine renaissance of the Hellenic universal state knew no geographical bounds short of those of Orthodox Christendom itself; and it transcended even these when, from a base of operations in the East Roman Empire's Norman successor-state in Sicily and Apulia, it was launched by Frederick II Hohenstaufen on its triumphal career of conquest in the Western World.³

R. G. COLLINGWOOD'S VIEW OF THE HISTORIAN'S RELATION TO THE OBJECTS THAT HE STUDIES

In the passage to which this Annex attaches,¹ we have quoted Collingwood's dictum:

'Western Civilisation expresses, and indeed achieves, its individuality, not by distinguishing itself from Hellenic Civilisation, but by identifying itself therewith.'²

These words can only be construed to mean that in 'the Renaissance' of Hellenism the Western World was doing what is done by a man who expresses and achieves his individuality, not by distinguishing himself from Napoleon, but by identifying himself with him; and this is in fact an accurate statement of what the makers of the Renaissance professed to be trying to do and claimed to have accomplished. The difference between a Humanist and a lunatic is in fact one of degree. The lunatic has 'bet his life' on his illusion, whereas the Humanist has taken care not to go to quite that fatal length.

For good or evil, the Modern Western Humanists were not plagued with the lunatic's devastatingly whole-hearted sincerity; they were, as Spengler depicts them,³ *poseurs* in whose activities there was a saving, and at the same time damning, element of make-believe. Their identification of themselves with 'the Ancients' was kept within the bounds of a few innocuous conceits. They aped the language and style of the classical Latin and Ancient Greek writers;⁴ they sometimes Latinized or Graecized their own barbarophone personal names; and for the occasion of a fancy-dress party or a pageant they would dress up in what they imagined to be classical costume; but they reserved the permanent assumption of the imperator's lorica or the orator's toga for their posthumous apotheosis in bronze or marble, and the same prudent unwillingness to sacrifice their physical comfort on the altar of their Hellenomania can be detected in their architecture. In discarding a grotesque Gothic in favour of a classical Vitruvian canon, they never carried their Hellenic purism to the length of renouncing fireplaces, chimneys, and glazed windows. This judicious discrimination in the pursuit of their

¹ p. 64, above.

² Collingwood, R. G.: *The Idea of History* (Oxford 1946, Clarendon Press), p. 163.

³ In the passage quoted on pp. 65-66, above.

⁴ This aping of an alien idiom might, however, cease to be a conceit through becoming a second nature; and the writer might, as Collingwood would testify from his own personal experience to the genuineness of a cultural metamorphosis in which he might otherwise have seen nothing more than a rather tiresome pose. As a result of his good fortune in having received a Late Medieval Italian education at the College of Saint Mary de Winton prope Winton and at Balliol College, Oxford, in the years A.D. 1902-11, he had acquired, and retained in after life, an articulateness in Greek and Latin of which he was destitute in his vernacular mother tongue. Whenever his feelings were deeply moved, they used to discharge themselves by finding expression in Greek or Latin verse which welled up spontaneously from the subconscious depths of his psyche.

folies saved the Humanists from the madhouse, but it also condemned them to be hustled off the stage of Modern Western history after a vogue which lasted no longer than two hundred years in the Transalpine provinces of an Occidental pseudo-Hellas. A seventeenth-century controversy between the champions of 'the Ancients' and 'the Moderns' had resulted, as we have seen,¹ in the exorcizing of the Renaissance and the reassertion, in the Modern Western World, of the Western Civilization's own native bent about a quarter of a millennium before the date at which Collingwood pronounced that the Western Civilization had identified itself with the Hellenic and had thereby expressed and achieved its own individuality.

In the same passage² Collingwood also asserts that, in performing this alleged feat of identifying itself with Hellenism, the Western Civilization has done 'exactly' [*sic*] what is done by 'the historian who studies a civilization other than his own'; and this assertion, too, takes the reader aback by coming into headlong collision with reality; for, however like a lunatic the historian may look in any other respect, he does at any rate hold the diametrically opposite view to the lunatic's view about his relation to Napoleon. The one mistake about Napoleon that an historian is sure not to make is to mistake the Napoleon whom he is studying for the historian himself.

It would, of course, be unlikely *a priori* that a thinker who, like Collingwood, was an eminent historian, as well as an eminent philosopher, really intended to say what he actually says in this startling passage. The context in which these assertions occur is a criticism of the present writer's idea of History as seen through Collingwood's eyes, and these statements of Collingwood's own ideas are thrown out here just in passing. More carefully considered statements of his views are to be looked for in the essays, published in the same volume as epilogomena to *The Idea of History*, in which Collingwood's first concern is, not the criticism of other people's ideas, but the exposition of his own; and, if Collingwood had lived to revise these sibylline leaves of his for publication, we may be sure that he would have sorted out and cleared up any inconsistencies between them, and may guess that in bringing his divers statements into harmony he might have reconsidered some of his premises. This was, of course, a task which no one but Collingwood himself could have undertaken; and, in using a posthumously published edition of his work in which the editor has perforce left the content (as distinct from the layout and some of the form) of the book in the unfinished state in which it happened to be when the brilliant author of it was overtaken by a premature death,³ the student who wishes to profit from this skilfully salvaged intellectual treasure must do his best, in the face of inevitably uneliminated inconsistencies, to divine which exposition it is, where divers expositions conflict, that most faithfully reflects Collingwood's thought at its zenith.

In the case in point—in which we are seeking to ascertain what Collingwood really meant by saying that an historian identified himself

¹ On pp. 68–69, above.

² Collingwood, op. cit., p. 163.

³ See the Editor's preface to Collingwood, op. cit., p. v.

with the object of his study—the passage quoted above is manifestly less authoritative than another,¹ in which Collingwood answers an imaginary critic's objection that Collingwood's theory implies 'an immediate identity between the historian and his object'—'say Thomas Becket'—by putting it that

'for Becket, in so far as he was a thinking mind, being Becket was also knowing that he was Becket; and for myself, on the same showing, to be Becket is to know that I am Becket, that is, to know that I am my present self re-enacting Becket's thought, myself being in that sense Becket.'

To credit the lunatic's statement 'I am somebody other than myself' with having the meaning of the sane man's statement 'I am myself thinking thoughts that somebody else has already once thought' is to strain the interpretation of plain words to a degree that Collingwood would not readily have tolerated if the torturer had been anyone but himself. A forced interpretation that vindicates the historian's sanity is, nevertheless, proved to be Collingwood's true meaning by the testimony of other passages whose cumulative weight of evidence is decisive.

'All thinking is critical thinking; the thought which re-enacts past thoughts [*sic*], therefore, criticises them in re-enacting them.² . . . The historian . . . re-enacts past thought [*sic*] . . . in the context of his own knowledge and therefore, in re-enacting it, criticises it.³ . . . This re-enactment . . . is not a passive surrender to the spell of another's mind; it is a labour of active and therefore critical thinking.⁴ . . . Unless he knows that he is thinking historically, he is not thinking historically.⁵ . . . Historical thinking is always reflexion; for reflexion is thinking about the act of thinking, and . . . all historical thinking is of that kind.'⁶

By this time it has become clear that Collingwood's historian is not, after all, going to be certified as insane. Yet his acquittal on the charge of lunacy leaves him still open to a hardly less serious charge of eccentricity, to which he exposes himself by insisting on confining his field of action within limits that look capriciously arbitrary to Philistine eyes.

'All history is the history of thought.⁷ . . . Of everything other than thought, there can be no history.⁸ . . . In order . . . that any particular act of thought should become subject-matter for history, it must be an act not only of thought but of reflective thought.⁹ . . . Reflective acts may be roughly described as the acts which we do on purpose, and these are the only acts which can become the subject-matter of history.'¹⁰

It will be noticed that the acts of reflective thought which are declared by Collingwood on one page to be the only possible subject-matter for history are equated by him on the next page with 'the acts which we do on purpose'; and here it looks to the historian-Philistine as if the historian-philosopher has slipped unintentionally and unconsciously into practising a sophist's sleight of hand; for, unless some undeclared esoteric construction is to be placed upon the meaning of Collingwood's words, 'the acts which we do on purpose' include acts of other kinds—

¹ Collingwood, *op. cit.*, pp. 296–7.

for instance, acts of will—besides acts of reflective thought; and acts of other kinds—for instance, acts of impulse as well as acts of will—play a much larger part than any acts of reflective thought in the action that is the subject-matter of History as we find this 'in real life' when we look at the actual practice of historians without allowing a philosopher's *a priori* dictum to hypnotize us into ignoring the realities.

In another passage,¹ in which Collingwood speaks of the historian as 'investigating actions' and consistently defines an 'action' as being an event that has something 'in it which can only be described in terms of thought', in contrast to 'everything belonging to it which can be described in terms of bodies and their movements', the philosopher takes, as an illustration of his meaning, Caesar's action in crossing the Rubicon. The least philosophical-minded of historians would assuredly agree with Collingwood that the physical movements made by Caesar and his troops, when they transported themselves from the north to the south bank of a river, were only a trivial element in the action that is both the object of the historian's study and the fount of the River Rubicon's fame; and the historian would also agree that the psychic element in Caesar's action, which is recognized, by a general consensus, as being the significant element in it, can be described in terms of thought in one of its aspects; but he would demur to Collingwood's assertion that this non-physical element 'can only [*sic*] be described in terms of thought'; for the 'thought' which Collingwood cites to prove his point is 'Caesar's defiance of Republican law, or the clash of constitutional policy between himself and his assassins',² and in the ordinary usage of words these events would not be called acts of 'thought'; they would be called an act of will on Caesar's part and a resulting conflict of wills between the author of this act and other dramatis personae in an interplay between Caesar and the constitutionalists which Caesar's initial act had set in motion.

This is not the only passage in which Collingwood's equation of the historian's subject-matter with 'thought' compels him to describe a familiar historical event in language which, if the words that the philosopher uses are to be taken in their normal meaning, will strike the reader as being quaintly inadequate.

For example, when 'the historian of politics or warfare' is trying to understand Caesar's actions, he is trying, according to Collingwood, 'to discover what thoughts [*sic*] in Caesar's mind determined him to do them'.³ Caesar is an unusually favourable subject for Collingwood's verbal treatment, since History knows few men of action of his calibre in whose psychic 'make-up' the intellectual element has counted for so much; yet even in Caesar's history the historian's main concern is not, in reality, with the thoughts in Caesar's mind; for even in a Caesar's psychic spectrum it is the 'affective' and the 'conative', not the 'cognitive', activities that loom largest in the historian's field of vision. In the historian's endeavours to understand Caesar's actions, Caesar's thoughts are *les cadets de ses soucis*; Caesar's feelings, ambitions, purposes, and decisions are the first things about Caesar that the historian seeks to

¹ *Ibid.*, p. 213.

² *Ibid.*

³ *Ibid.*, p. 215.

discover. If he were to start by trying to discover Caesar's thoughts and were to content himself with leaving it at that, the historian would then be leaving himself still in the dark. This is why Collingwood's phrase makes the impression of artificiality that it does make on the mind of Collingwood's reader; and the same impression is made by Collingwood's formula for Brutus:

'When an historian asks "Why did Brutus stab Caesar?" he means "What did Brutus think [*sic*], which made him decide to stab Caesar?"'

If Collingwood's imaginary historian were given the chance to explain his meaning in the language that came natural to him, he would not say, 'What did Brutus think?' He would say, 'What did Brutus feel?'

When Collingwood substitutes some stock character—'a politician' or 'a military commander'—for his historic Brutus or Caesar, the effect of the application of his formula is quaint still.

'If it were possible to say of any man that he acted with no idea whatever what would come of it, but did the first thing that came into his head and merely waited to see the consequences, it would follow that such a man was no politician, and that his action was merely the intrusion into political life of a blind and irrational force.'¹

The truth here is, of course, exactly contrary to Collingwood's assertion. In real life such a man as Collingwood describes would be no politician if he did not [*sic*] behave in the intellectually horrifying way that the philosopher deprecates. President Wilson, for instance, proved himself to be no politician, and tragically brought himself to grief, by answering all too well to Collingwood's specification. This 'intellectual' who had been the president of a university before becoming President of the United States is one of the rare examples of a prominent actor on the political stage who would have been a strong candidate for Collingwood's degree of master of political arts. And, if blind and irrational forces were in truth outside the pale of political history, most published works on political history, from Thucydides' *History of the Atheno-Peloponnesian War*² to D. C. Somervell's *British Politics since 1900*,³ would have to be thrown on the scrap-heap. Yet, in Collingwood's own words, 'it would be generally admitted that politics is a thing that can be historically studied'.⁴

How has Collingwood got himself into this tangle? He has entangled himself by giving a wrong explanation of a commonplace truth. 'The reason', he goes on to assert, why it is possible to study politics historically 'is that politics affords a plain instance of purposive action'; and since this assertion flies in the face of historical facts it is not surprising that it should reduce *ad absurdum* an idea of History that is founded on it.

The same false premise, applied to the history of warfare, leads Collingwood into the equally untenable position of maintaining that if a military commander's acts were not done on purpose 'there can be no

¹ Collingwood, *op. cit.*, pp. 309-10.

² *Scaptēsylē*, date uncertain, publisher unrecorded.

³ London 1950, Dakers.

⁴ Collingwood, *op. cit.*, p. 309.

history of them'.¹ An open-minded student of military history will find this dictum of Collingwood's less convincing than the picture of Bagration's generalship in Tolstoy's *War and Peace*.

We need not, however, *subpoena* either Tolstoy or Somervell or Thucydides to rise up in judgement against² Collingwood, since we can win our case more expeditiously by appealing from Collingwood theorizing about history as a philosopher to the same Collingwood studying and writing history as an historian. An equal eminence in two fields of intellectual activity was the distinctive mark of Collingwood's genius, and his characteristic achievement as an historian was his masterly employment of Archaeology in History's service. 'Everything belonging to' an event 'which can be described in terms of bodies and their movements'³ was grist to Collingwood the historian's mill, though it might be chaff to Collingwood the philosopher's winnowing fan; and, in virtue of their rare archaeological merits, Collingwood's own historical works would fail still more ignominiously than Thucydides' or Gibbon's to pass the test of Collingwood's idea of History.

How has this historian-philosopher arrived at an idea of History which he has confuted by 'direct action' of his own? Collingwood's confutation of Collingwood is as irresistible as Doctor Johnson's confutation of Bishop Berkeley. The historian has given a conclusive kick to a philosopher's stone that is a plain man's stumbling-block. How has the philosopher ever come to erect the artificial obstacle which the historian in the same philosopher's skin has unceremoniously removed from our path? An answer to this question may perhaps be elicited from the following arrestingly paradoxical passage.

'If the discovery of Pythagoras concerning the square on the hypotenuse is a thought which we today can think for ourselves, a thought that constitutes a permanent addition to mathematical knowledge, the discovery of Augustus, that a monarchy could be grafted upon the Republican constitution of Rome by developing the implications of *proconsulare imperium* and *tribunicia potestas*, is equally a thought which the student of Roman history can think for himself, a permanent addition to political ideas. If Mr. Whitehead is justified in calling the right-angled triangle an eternal object, the same phrase is applicable to the Roman constitution and the Augustan modification of it. This is an eternal object because it can be apprehended by historical thought at any time; time makes no difference to it in this respect, just as it makes no difference to the triangle.'⁴

In this passage Collingwood shocks even an unphilosophic-minded reader by placing a political improvisation on all fours with a mathematical proposition on the score of its being 'a permanent addition to political ideas'. The mathematical theorem which came into the focus of human consciousness for the first time in Pythagoras' mind, according to the Hellenic tradition, was in truth 'a permanent addition to mathematical knowledge' in the sense that, when once this element in an eternally valid system of mathematical truth had been brought within the pale of a Collective Human Intellect, it was open, ever afterwards, to any other

¹ Ibid., p. 310.

³ Ibid., p. 213.

² Matt. xii. 42.

⁴ Ibid., pp. 217-18.

individual mind to apprehend the theorem for itself, and use it for the purposes of its own mathematical thought, on the sole condition of having access to a cumulative body of mathematical knowledge that was one of the common possessions of Mankind. On the other hand, if a President of the United States who happened, like President Wilson, to be a better historian than politician were to act on Collingwood's thesis that Augustus's discovery was 'a permanent addition to political ideas', he would quickly run into trouble that will never overtake the mathematician who acts on the assumption that Pythagoras' discovery was 'a permanent addition to mathematical knowledge'.

In a Western international arena on the morrow of a Second World War, let us imagine a President Wilson *redivivus* coming to the conclusion that Mankind can be saved from committing the crime and folly of race-suicide only by the prompt establishment of an effective oecumenical government. His next thought will be that, in the existing oecumenical constellation of political forces, the Presidency of the United States is the one well-established vantage-point from which it might be just possible to achieve the Herculean task of reducing a world-wide political anarchy to a world-wide political order. His next thought after that will be that the Presidency's powers, as laid down in the Constitution of the United States and as customarily interpreted in American political practice, are at present quite inadequate for the accomplishment of this urgent and arduous political labour. And this thought, in turn, will lead on to the further consideration that, however desirable it may be that the powers of the Presidency of the United States should be enlarged to the requisite extent, and however ardently this change in the Constitution of the United States may be desired by the vast majority of Mankind who are not American citizens, the change cannot be made without the acquiescence of at least a sufficient majority in the Senate and People of the United States to make a presidential dictatorship workable for practical purposes. But how can the Senate and People be induced to play their indispensable part? Clearly it would not be practical politics just to put the cards on the table and, in the light of them, make a naïve appeal to Reason and to Virtue; for the most adult-minded electorate and most experienced representative body could not be expected to make so great a readjustment of its political feelings and ideas at such short notice. Again, it would not be practical politics to try coercion; for, even if the inevitable resistance could be overcome, the struggle would generate a friction that would bring the high-handed usurper's benevolent activities to a standstill. In a fix in which neither Force nor Reason will break the deadlock, the only remaining alternative is to try cajolery; and at this stage in his brown study our imaginary historian-president will recollect that this was the device by which the problem now confronting him was solved, in other ages and in other worlds, by an Augustus and a Mu'āwiyah and a Han Liu Pang.

So far so good; but in the political arena, in contrast to the intellectual forum, to apprehend a proposition is not the same thing as to put it into effect; for a practical proposition, unlike a theoretical one, has to be translated into action, and this action will be successful only in so far as

it is geared to the actualities of Here and Now. The fineness of their sense of these all-important actualities was the common gift that was the secret of Augustus's and Mu'āwiyah's and Liu Pang's common success; and their possession of this gift explains why it was that Augustus and Liu Pang succeeded in solving problems that had defeated their more brilliant forerunners Divus Julius and Ts'in She Hwang-ti.¹ The very brilliance of their ideas had been the undoing of those two men of genius, for it had enticed them to fly straight into the light, like moths plunging into the flame of a candle. The clarity with which they perceived their goal had made them so impatient of approaching it by any roundabout road that, instead of being content to feel their way between the natural obstacles, they had tried to ride roughshod over the perilous broken ground of actualities that were none the less actual for being irrational. Caesar the God invited assassination by allowing his partisans to make the provocative gesture of paying him royal honours; Augustus the politician discovered 'that a monarchy could be grafted upon the constitution of Rome by developing the implications of *proconsulare imperium* and *tribunicia potestas*'; but this Augustan 'modification' of the republican constitution of Rome was the antithesis of the 'eternal object' that had been Divus Julius's will-o'-the-wisp; and, if any twentieth-century dictator-aspirant were to follow Collingwood's prescription by trying to 're-enact' Augustus's 'experience for himself',² he would soon find himself in queer street; for, just because Augustus's sly policy fitted Augustus's own political milieu like a glove, it was bound, if tried in any other political milieu, to prove there an egregious misfit. Since a sensitiveness to the exigencies of his own Here and Now was the secret of Augustus's success, the only profitable lesson that a twentieth-century American aspirant to an oecumenical dictatorship could learn from 'the crafty nephew of Julius'³ would be the hint that his cue was to develop with equal tact, care, and patience the implications of the presidential prerogative in the written and the customary constitution of the United States. A cue that, taken in these general terms, might put him on the road towards an Augustan success would infallibly lead him into a Julian disaster if he were ever to try to translate it from the general into the particular by setting out to develop the implications of *proconsulare imperium* and *tribunicia potestas* in the second half of the twentieth century of the Christian Era at Washington, D.C.

Collingwood's contention that Augustus's political contrivance is 'a permanent addition to political ideas' and 'an eternal object' thus proves to be untenable; and it is, indeed, implicitly contradicted by Collingwood himself in another passage published in the same book.

'The *Republic* of Plato is an account, not of the unchanging ideal of political life, but of the Greek ideal as Plato received it and reinterpreted it. The *Ethics* of Aristotle describes, not an eternal morality, but the morality of the Greek gentleman. Hobbes's *Leviathan* expounds the political ideas of seventeenth-century absolutism in their English form.

¹ See V. vi. 186-9.

² Collingwood, *op. cit.*, p. 163.

³ Bryce, quoted in I. i. 343.

Kant's ethical theory expresses the moral convictions of German pietism; his *Critique of Pure Reason* analyses the conceptions and principles of Newtonian Science, in their relation to the philosophical problems of the day.¹

Here the historian in Collingwood joins forces with the philosopher in him to proclaim the relativity of political, ethical, and even meta-physical thought to the local and temporary social milieu in which the thinker is living and working; and the unphilosophic historian will break no lance with Collingwood over this issue; he will, though, find himself all the more curious to discern how it can be that an historian-philosopher who so resolutely refuses the status of 'an eternal object' to a product of political thought can at the same time venture to confer this enviable status upon a product of political action. An act of thought—even when its object is the parochial, ephemeral, and contingent world of politics—is at any rate more nearly akin to an act of thought in the realm of Mathematics than it is akin to an act of state in the realm of practical political activity. To dub Augustus's principate 'an eternal object', while describing Plato's *Republic* as a progress report on the state of political science up to the date of its publication, is a paradox that demands an explanation.

What motive has led Collingwood to commit himself to this *tour de force*? He has set his readers a puzzle, but he has also supplied them with the key. It is evident that, in Collingwood's view, the perfect kind of knowledge is the mathematician's relation to the objects that he studies. This mathematical kind of knowledge is Collingwood's ideal; and in the emotional thermometer of his feelings the prestige of Mathematics attains so high a degree that the best turn that Collingwood can think of doing to the historian is to demonstrate, if he can, that the historian's kind of knowledge is a knowledge of this mathematical sort. If this diagnosis is correct, Collingwood's idea of History—like any other idea entertained by any other philosopher, however intellectually austere he may be doing his best to be—carries a human charge of emotion in it. The emotional 'affect' that is just perceptible in this passage may be presumed to be latent elsewhere; and, if the presence of this emotional nigger can in truth be detected in Collingwood's intellectual wood-pile, we have here identified the villain who has betrayed the philosopher's thought into confusions that have landed him in intellectually untenable positions. In the equation of an Augustan principate with a Pythagorean theorem we can detect two intellectual flaws in Collingwood's idea of History that can both be traced to this 'affective' origin. One of these is a failure to distinguish between the historian's and the mathematician's diverse interests in the same mathematical proposition; the other flaw is a failure to distinguish between the historian's way of apprehending the thought in a mathematical proposition and the same historian's way of apprehending a mathematical or any other act of thought in its historical setting in real life, where acts of thought are always found to be intertwined with acts of will and acts of feeling in a psychic rope in which the intellectual strand is sometimes conspicuous mainly by its virtual

¹ Collingwood, *op. cit.*, p. 229, quoted on p. 198, above.

absence. These distinctions that the philosopher has ignored to his cost must now be investigated by the historian at his peril.

The difference between the historian's interest and the mathematician's in taking cognizance of the same mathematical proposition is not difficult to descry. When a mathematician is confronted with a mathematical proposition, he asks himself two questions: first, 'Is it true?' and, second, 'If it is true, then what position does this particular piece of mathematical truth occupy in the structure of the general system of mathematical truth in so far as this system and its structure are known to me?' For these professional purposes of the mathematician's, it does not matter when, where, or how this particular mathematical truth first happened to become known to the mind of some individual human being. Let the memory of Pythagoras' life and work 'fly forgotten as a dream'; the proposition which an historian associates with Pythagoras' name would lose none of its mathematical validity through becoming a proposition without a history. Its mathematical validity is conferred on it solely and wholly by an apprehension of its truth in the mind of a mathematician who is thinking it at the moment. This is the sense in which it is 'the eternal object' that Whitehead has proclaimed it to be. It is an element in a system of mathematical truth which is intrinsically self-consistent, coherent, and constant; and these intrinsic characteristics of this system of truth are not affected by the historical fact that a knowledge of it, accumulated in 'the collective consciousness' of the Human Race, has been, and is still being, acquired piecemeal by the successive intellectual exertions of individual human minds. In other words, the eternity of any object of thought that is successively entertained by the minds of a series of mathematicians has its converse, condition, and price in the impersonality with which this object is entertained by one mind after another without establishing any human link between them.

In thinking a proposition which Pythagoras is said to have been the first human being to have thought, a latter-day mathematician is not 're-enacting' Pythagoras' 'experience for himself';¹ for the experience shared with Pythagoras by this historical successor of his is the bare intellectual act of thinking an impersonally mathematical thought,²

¹ Collingwood, *ibid.*, p. 163.

² This point is made by Collingwood himself in another context: 'Even thought itself, in its immediacy as the unique act of thought with its unique context in the life of an individual thinker, . . . cannot be re-enacted; if it could, Time itself would be cancelled and the historian would be the person about whom he thinks, living over again in all respects the same. The historian cannot apprehend the individual act of thought in its individuality, just as it actually happened. What he apprehends . . . is the act of thought itself, in its survival and revival at different times and in different persons' (*ibid.*, p. 303). This is Collingwood's exegesis of his own previous contention that 'the process of argument which I go through is not a process resembling Plato's, it actually is Plato's . . . if I not only read his argument but understand it—follow it in my own mind by re-arguing it with and for myself' (*ibid.*, p. 301; cp. p. 215).

We shall concur with Collingwood's considered view that, while the thought that is thought on the two occasions is identical, it can only be so in so far as it is impersonal; but we must apply to this conclusion of Collingwood's the distinction that we have drawn between the historian's purpose and the mathematician's or natural scientist's. It is true that the rethinking of a thought does not bring a later thinker of it into personal communion with an earlier thinker of it, and it is also true that a mathematical or scientific thinker is not seeking to conjure any ulterior personal communion out of the impersonal mathematical or scientific thought into which he does effectively enter. On the other

whereas Pythagoras' actual experience included the sensation of suddenly seeing the light, the belief that his was the first human mind that had ever seen it, and the emotional exultation of feeling himself to be an intellectual pioneer. All these non-mathematical elements in a mathematician's actual experience are expressed in Archimédês' exclamation *ἤρηκα*; yet the latter-day student of hydrostatics is deaf to a cry which, coming as it does from Archimédês' heart, never fails to thrill the heart of the historian, however faintly the sound may echo in the historian's ears across an ever widening gulf of fleeting Time.

There is indeed a piquant difference between the mathematician's impersonal way of looking at a proposition and the way in which the same proposition interests the historian. When the historian is confronted with it, he does not ask himself, 'Is this mathematically true?' He asks himself, 'What can this mathematical proposition tell me about the personality and life of Pythagoras and about the history of his social milieu—the thoughts, feelings, aims, and characters of Pythagoras and his contemporaries, predecessors, and successors in Samos and in Croton, in the Hellenic World at large, and in the other societies that were this society's successors, predecessors, and contemporaries? So long as the mathematical proposition associated with Pythagoras gives him some light on the answers to these historical questions, it is of no professional consequence to the historian whether the proposition happens to be mathematically true or false; for a mathematically true proposition might prove to be barren of historical information, while a mathematically false proposition might prove to be an historian's gold mine.

Since everything that has been said about Mathematics in this Annex is likewise true of Natural Science, the case of Astrology will serve to illustrate our point. In Collingwood's and Toynbee's day in Western scientific circles, Astrology was in deep disgrace. It was perpetually being cited as the classical example of a pseudo-science whose falsity had been exposed and whose prestige had been exploded;¹ yet, in this selfsame generation, masterly studies of astrological beliefs for historical purposes had been throwing floods of light on the *Weltanschauung* and *Gefühlsart* of the children of the Babylonian Civilization who had invented—or discovered—Astrology in the eighth century B.C.² and the children

hand the historian, even if he fails fully to apprehend this impersonal mathematical thought, may nevertheless succeed in utilizing it for his own ulterior purpose of making a psychic passage across the gulf of Time and Space that lies between him and some earlier thinker of the same thought with whom he is seeking to make contact (see pp. 729 and 730, below).

¹ There was, of course, a long time-lag between the date, before the close of the seventeenth century of the Christian Era, at which Modern Western men of science ceased to believe that astrological propositions were true and the consummation of Astrology's ruin as a practical going concern in non-scientific circles in the West and elsewhere. In A.D. 1952 a glance at any issue of any organ of the popular press in England would inform an historian that at this date Astrology, so far from having been sent to Jericho, was fast occupying a spiritual vacuum created by the waning of Western Man's belief in the truth of Astrology's old rival, Christianity. A more surprising phenomenon, of which there were indications at this date, was an incipient readmission of this long-since scientifically discredited science into the Eden of scientific truth from which it had once been ignominiously expelled. The tree of knowledge on to which Astrology was being grafted this time was not its ungrateful natural daughter Astronomy, but an indulgent adoptive mother—Psychology.

² See V. v. 56-57.

of contemporary and posterior civilizations, down to and including Collingwood's and Toynbee's own seventeenth-century forebears in the West, who had fallen like ninepins to the fascination of this professedly scientific system of ideas.

'The human interest' which attaches to the history of astrological beliefs, and which is just as well served by a study of them if they happen to be scientifically false as if they happen to be scientifically true, is the hidden treasure¹ that is the historian's lodestone. Nothing else except the quest for this trove would induce the historian to give his mind to scientific and mathematical propositions which for the historian have no intrinsic professional interest either *a priori* or even in consequence of the historian's being told by a *savant* that the *savant* believes them to be true—and, perhaps, not only true but momentous—in the inhuman realm of scientific and mathematical reality.

It will be seen that the mathematician's and the historian's respective professional interests in the same mathematical proposition are mutually exclusive; and consequently either party's interest is at best boring to the other party and at worst exasperating to him. The historian has no professional use for a system of mathematical or scientific truth if he is asked to study it for its own sake; for he is not concerned to certify the permanence of 'a permanent addition to mathematical knowledge' in thinking this mathematical thought for himself, any more than he is concerned to certify the permanence of 'a permanent addition to political ideas' in entering into the thoughts and aims of Augustus. If he sets himself to think thoughts that were once entertained by the mind of either an Augustus or a Pythagoras, his purpose is to utilize the political calculation or the mathematical theorem as an intellectual spring-board from which his imagination can make an attempt, by taking a flying leap, to establish psychic communications with other human souls whose intellects have thought the same thought at other times and places. Conversely, the mathematician or natural scientist has no professional use for the history of mathematical or scientific beliefs.

It is true that the beliefs which mathematicians and scientists will be found to be holding at any date will always also be found to be the historical product of beliefs held by their predecessors, some of which will have been retained, and others discarded, by these past thinkers' present epigoni; and this is an aspect of mathematical and scientific beliefs that is of greater professional interest to an historian than the mathematician's or scientist's professional question whether these beliefs happen to be intrinsically true or false. At any date at which the historian takes a sounding, he is apt to find the mathematicians and scientists of that generation indebted to the past beliefs that they have discarded, not much less deeply than to those that they have retained; but the historian is also apt to find himself being astonished by his own mathematical and scientific contemporaries' ingratitude. If they are confronted with one of their predecessors' beliefs, their first question is not, 'What do we owe to it?' but, 'Is it true or false?' And, if once they have pronounced it to be false according to their own present lights, they suffer

¹ Matt. xiii. 44.

no natural human sentiment of gratitude to restrain them from ruthlessly consigning this discarded belief to the scrap-heap, as a nuisance of which they must resolutely rid their minds for fear that it might breed intellectual confusion and error there if they were to dwell on it at the prompting of their own better feelings.

When once men of science have thus condemned some previously orthodox belief, it is idle for the historian to upbraid them for this impiety towards their predecessors. He will meet with no success in his endeavour to prick these hard hearts to compunction. The mathematician's and the scientist's judgement on the history of Mathematics and Science runs on the lines of the Caliph 'Umar's legendary dispatch to his lieutenant 'Amr b. al-'Ās in reply to 'Amr's request for instructions for the disposal of a Ptolemaic Library at Alexandria in which the treasures of an Hellenic literary culture had been accumulating for the best part of a millennium by the date of the Arab conquest of Egypt. 'If these writings of the Greeks agree with the Book of God, they are useless and need not be preserved; if they disagree, they are pernicious and ought to be destroyed'¹ is the minute which 'Umar is said to have made on 'Amr's query. 'If these tenets held by our predecessors agree with those held by us today, they are useless and need not be preserved; if they disagree, they are pernicious and ought to be destroyed' is the answer which, in fact and not in fiction, the historian evokes from the mathematician and the scientist when he begs them to take a pious interest in the genesis of their own current beliefs.

If we have now sufficiently explored the difference between the historian's and the mathematician's or scientist's respective interests in the same mathematical or scientific proposition, we may pass on to an examination of the difference between the historian's way of apprehending a thought that has been thought in other minds before his, and his way of apprehending the manifold human experience in which every act of thought is actually implicated in real life.

We have observed already² that the historian, when he is thinking for himself a thought that has also been entertained by some other person's mind in some other time and place, is not interested in the naked thought for its own sake; he is interested in it as a possible spring-board from which he may perhaps find himself able to take a flying leap into psychic communion with that other person who, in his own act of entertaining the same thought, was certainly animated by feelings associated with his act of thinking, and was perhaps also meditating, planning, or executing some associated act of will for the weal or woe of his contemporaries. This interest, which is a genuine historian's abiding ultimate interest,

¹ Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, chap. li, paraphrasing the thirteenth-century Jacobite Monophysite Patriarch of Antioch, Abu'l-Farāj (*alias* Mar Gregor of Malatīyeh, *alias* Bar Hebraeus). Gibbon's paraphrase is based on a passage on p. 114 of Edward Pocock's Latin translation (Oxford 1663, printed by H. Hall, Printer to the University) of 'Abulpharagius's' own Arabic translation, from the original Syriac text, of the political part of his chronicle of universal history, both political and ecclesiastical. The title of this Arabic version is *Tārikh Mukhtasar al-Duwal* (*Historia Compendiosa Dynastiarum*). The story has been cited in VI. vi. 111-12.

² On p. 729, above.

could not have been described more accurately than it has been described by Collingwood in the following words:

'To the historian, the activities whose history he is studying are not spectacles to be watched, but experiences to be lived through in his own mind; they are objective, or known to him, only because they are also subjective, or activities of his own;'¹

and if it were indeed true of Toynbee, as Collingwood believes it to be, that

'he regards History as a mere spectacle, something consisting of facts observed and recorded by the historian, phenomena presented externally to his gaze, not experiences into which he must enter and which he must make his own,'

then—q.e.d.—Toynbee would have been convicted by Collingwood of being no historian.

This personal question is, of course, a trivial piece of private business; and in any case the only line of defence that would be likely to appeal to the defendant's readers would be for him to whisper *Circumspice* and then at once move on to the next piece of public business on the agenda—and this is the momentous question: How far is it actually possible for the historian to perform that feat of living through other people's experience which is agreed on all hands to be the historian's proper aim? Collingwood's answer is that it is possible for the historian to achieve this aim completely; but if he is able to give this simple and satisfactory reply this is only because, as we have noticed already,² Collingwood defines the area of the historian's field of sympathetic magic in terms that strike an historian-philistine as being arbitrarily restrictive. 'All history is the history of thought'³. . . . Of everything other than thought, there can be no history⁴. . . . The record of immediate experience, with its flow of sensations and feelings, . . . is not history',⁵ Collingwood maintains; and in thus defining and limiting the historian's field he is alleviating, by the exercise of a royal prerogative, the weight of the load that the imperious philosopher has legitimately imposed on the historian's devoted shoulders. When Collingwood admonishes the historian that 'he must always remember that the event' which he is studying 'was an action, and that his main task is to think himself into this action',⁶ he reduces this Psyche's Task to finite dimensions by a ruling that is as merciful as it is arbitrary. 'To think himself into this action' is to be interpreted, Collingwood rules, as meaning 'to discern the thought [*sic*] of its agent'. The same restrictive interpretation is applied again when Collingwood reminds the historian that 'the events of history are never mere phenomena, never mere spectacles for contemplation, but things which the historian looks, not at, but through';⁷ for, after thus demanding of the historian's vision that it should pierce, and not just strike, its target, he scales down his demand, here too, by defining the

⁵ Ibid.

⁷ Ibid., p. 214.

objective of this arduous penetration as being 'to discern the thought [*sic*] within' the objects under fire.

If it were indeed true that 'thought' was the sole possible element in human experience that the historian's psyche can apprehend, and therefore the sole legitimate target for the historian's proper aim of penetrating through the phenomena to the psychic inwardness of events, the historian's task, however exacting, would at least be straightforward, since, as we have seen, it is practicable for the same thought to be entertained by the minds of different persons, and there is one body of thought—namely mathematical and scientific thought—that is a thoroughly impersonal product and possession of a 'Collective Human Consciousness'. Unhappily for the historian, this doctrine of Collingwood the philosopher's is a dogma which is belied by the experience and practice of historians, including Collingwood himself on the evidence of his own published historical works. In real life, thought is never to be found apart from the non-intellectual strands in the composite rope of human experience; and, if Collingwood is right—as he is right—in requiring of the historian that he must 'enter into' other people's experiences and 'live through' them, he is wrong in instructing the historian to ignore all strands of experience except the intellectual strand.

The historian, for his part, must therefore resist the temptation to close with this relatively easy option. He must take to heart Collingwood's commandment 'Thou shalt get inside events'; but he must obey this commandment more rigorously than Yahweh requires of him. If he is to participate in other people's experiences, he must participate, not only in their thoughts, but also in their emotions and in their volitions; and his task will not have been achieved even when he has participated in the total individual experience of some single personality; for any act of will implies and duly produces an encounter between the person who performs the act and at least one other person whose action the act of will is intended to influence. An experience that embraces acts of will must, *ex hypothesi*, also embrace encounters; and this *a priori* conclusion is, of course, borne out by our own experience in this Study, in which we have been led by an empirical method of inquiry to find, below the surface of this phenomenon of encounters between personalities, the mysterious fount of spiritual creativity.¹ The historian must obey Collingwood's commandment over a wider field of experience than the intellectual allotment of which, alone, Collingwood takes cognizance; and from this it follows that the historian must discover for himself some additional means of establishing psychic communications with the human objects of his study beyond a re-performance of acts of thought which is the sole means suggested by Collingwood for attaining an arbitrarily limited objective.

The inadequacy of Collingwood's prescription for an historian's *modus operandi* is not, of course, equally obvious in all cases. It is least obvious where the intellectual strand in the experience in which the historian has to participate is the most important strand in this experience in the unanimous opinion of the historian and the subject of

¹ See II. i. 271-99, and pp. 395-405, above.

the particular experience that is the historian's object of study in the case in point. A classic instance of this type of case is that experience of Pythagoras' which Collingwood has cited. In Pythagoras' and Posterity's opinion alike, the important element in this experience is the thought that the area of the square on the hypotenuse of a right-angled triangle is equal to the sum of the areas of the squares on this triangle's other two sides. Pythagoras himself would have been the first to pronounce that the thrill of exultation accompanying the mathematical pioneer's experience of intellectual discovery was a piece of private business that cannot compare in importance with the momentousness of the associated impersonal mathematical thought. Yet however austere that exultant feeling may be depreciated by the historian's and Pythagoras' consentient intellects, their concordant hearts cannot help leaping up at the recollection of it, to thrill rebelliously in unison. Even when the gist of an experience is a mathematical theorem, an irrepressible explosion of concomitant feeling proclaims that Thought is not the whole of Life and that Nature will keep on coming back at you however energetically you may have pitched her out.¹

If Collingwood's prescription thus proves inadequate to the historian's need even when the experience in which the historian has to participate is Pythagoras the mathematician's, how is the poor historian likely to fare in coping with some experience of 'Timur Lenk the ogre's'? In the ghastly history of human affairs, Pythagoras' experience of the thrill of discovering a theorem inside the city-wall of Croton is, after all, an event of a rarer and less characteristic kind than Tamerlane's experience of the thrill of building minarets out of five thousand human heads outside the city-wall of Zirih;² and how is the conscientious historian to 'enter into' and 'live through' that? The pertinent difference between this experience of Tamerlane's and that experience of Pythagoras' is that the strand of thought, which looms so large in Pythagoras' experience, is so exiguous in Tamerlane's experience as to be barely discernible, whereas the exuberance of Tamerlane's feelings on this gruesome occasion must have been veritably Gargantuan. By comparison, the thrill experienced by Pythagoras was a barely perceptible emotional tremor. Since 'the activities whose history' the historian 'is studying . . . are objective, or known to him, only because they are subjective, or activities of his own',³ he has to make Tamerlane's experience 'an integral part of his own . . . by re-enacting' it 'for himself';⁴ and at this point, if the historian is a truly conscientious workman, the shadow of the madhouse once again falls athwart his thorny path.

How is a scrupulous historian to set about the job? We have to picture him studying a gazetteer to find some easily accessible town whose population will suffice to provide him with about twice the number of heads (to be on the safe side) that he requires for making a pile of the same order of magnitude as Tamerlane's historic pile at Zirih. He selects Princeton, New Jersey; takes the afternoon train from

¹ Horace: *Epistulae*, Book I, Ep. x, l. 24.

³ Collingwood, *op. cit.*, p. 218.

² See IV. iv. 500.

⁴ *Ibid.*, p. 163.

New York; gives himself a good night's rest at the inn or the tavern; raises his temper to the requisite pitch by meditating for five minutes on the last demand-note served on him by the Bureau of Internal Revenue; rushes out in a thoroughly Tamerlanian rage into the quiet unsuspecting streets; and has not bagged more than half a dozen heads towards his target of five thousand before he finds himself in the police court being asked by the magistrate what he means by it. When he explains that he has not been committing a *crime passionel* but has been simply taking seriously his professional duties as Tamerlane's historian under Collingwood's marching orders, an enlightened Department of Justice sends him, not to the electric chair, but to the asylum. What a theme for Edward Lear!

In the eyes of an outraged society, the homicidal maniac has got off lightly; yet, even as it is, this professionally scrupulous historian's fate is sad enough from the victim's personal standpoint. Is there any way out of such an awkward dilemma? Can our devoted historian find some means of doing his professional duty by Tamerlane without making all that havoc of his own life, not to speak of his neighbours'? Yes, it is open to him to participate in Tamerlane's experience without 're-enacting' it in real life if he can bring himself to use his imagination. This alternative course likewise has its price. The historian who does his job by using his imagination is exposing himself to the censure meted out by Plato to painters and poets who have brought this sly faculty into play in their own professional activities. Yet to be castigated by Plato is, after all, a lesser evil than to be certified insane.

'Your painter,' Plato half-seriously complains, 'will paint for you a shoemaker, carpenter, and every other kind of artisan without ever having been initiated into the technique of any of these trades; yet, all the same, if he is a good artist, he will be able to take in a child or a feeble-minded adult by painting him a carpenter that he will mistake for a real carpenter if he is given a distant view of the picture. . . . [In fact,] when someone tells us, about someone else, that in him he has met a man who is a master of all trades and actually has a more accurate knowledge of each single one of them than can be claimed by any of that particular trade's professional practitioners, our conclusion will be that our interlocutor is a simpleton and that he must have come across a cheat who took his victim in so completely by tricks of mimicry that he succeeded in giving him the impression that he was a universal genius—owing to the victim's inability to distinguish between mimicry and knowledge and ignorance. . . .

'Well, this calls for an inquiry into "high-brow" poetry (*τραγωδία*) and its presiding genius Homer, because there are people who tell us that these poets are masters of all the arts and of all the problems of ethics and of theology. A good poet, the argument runs, must *ex hypothesi* be a connoisseur of his subject if he is to write about it properly—if he were not a connoisseur, he would not be able to write at all. The question for inquiry is whether the poets may not be adepts at mimicry who have taken in these sponsors of theirs by a confidence trick which has been so well played that the victims of it, when they see the poets' works, do not tumble to it that these products are at three removes' distance from reality and are easy for an ignoramus to fabricate because these works of the poets' are not realities at all but are mere phantasms. . . .

'Let us now be generous to Homer or any confrère of his whom we may choose to interrogate. Let us confine our interrogation to a single question. We will not ask him: "If you are really a doctor and not just a mimic of the medical profession's patter, what evidence can you produce, master poet, ancient or modern, of cures performed by yourself?" . . . But we are justified in questioning Homer about the greatest and the noblest of the activities on which he has the assurance to hold forth—I mean, War and Generalship and Government and Education. "Well now, Homer," we may justifiably say to the poet, "If you are really not at three removes' distance from the truth in the relation in which you stand to human conduct at its best (*ἀρετῆς πέρι*)—if you are not one of those fabricators of simulacra whom we have labelled mimics—if you are really at no more than two removes' distance from the truth and are really an expert in the science of ethics, private and public, give us an instance of a state whose government has shown an improvement thanks to you". . . . Name a war, fought in Homer's lifetime, that is recorded to have been efficiently conducted thanks to Homer's leadership or counsel. . . . Is there any suggestion that Homer ever gathered round him in his own lifetime a school of disciples who felt it a privilege to be in personal touch with him and who handed down to Posterity the tradition of an Homeric way of life? . . .

'Well, [on this showing,] must not our verdict on Homer and all his successors in the poetic line be that they are mimics of simulacra of human conduct at its best and of any other subject that they may elect to adorn? I think we must conclude that they are quite out of touch with the truth, and must therefore place them in the same category as the painter, whom we were considering just now, who, without himself having been initiated into the technique of shoemaking, will make for you what will look like a shoemaker to eyes that judge merely by colours and shapes because their owners are no better initiated than the painter who has thus imposed on them. . . . On this analogy, we shall describe what the poet does by putting it that, without himself having been initiated into any technique except the art of mimicry, he tints his nouns and verbs with colours stolen from the divers trades and thereby makes, on birds of his feather who judge merely by words, an invariable impression of talking admirably about anything that he elects to talk about—shoemaking or generalship or what you will—so long as he does his business in metre and rhythm and harmony. It is these stage properties of his that do the trick for him in virtue of the extraordinary fascination that they exercise. If you strip off the literary colouring from a poet's ideas and make him express them in naked prose—well, I do not need to tell you what the impression then will be. . . . You have seen what happens to a face that is in the flush of youth without possessing any intrinsic beauty. You know what that face comes to look like when the bloom has faded.'¹

If Plato means his readers to take this passage at all seriously, he has committed himself to approving our over-scrupulous historian's legendary escapade. If Plato had heard the news of our mythical 'incident' at Princeton, New Jersey, and had had the courage of his own professed convictions, he would have appeared in court to testify on behalf of the defence that the prisoner in the dock would have been committing a cold-blooded fraud on the public if he had undertaken to produce and publish a work purporting to be a history of Tamerlane without attempting bona fide to make Tamerlane's experience 'an

¹ Plato: *Respublica*, 598 B-601 B.

integral part of his own . . . by re-enacting' it 'for himself'. If our historian has any sense, however, he will be less grateful to Plato for this courageous defence of his conscientious head-hunting expedition than for his disclosure of a trick for doing an historian's professional business without having to go to these embarrassing extremes. Plato, if he likes, may give this trick the bad name of 'confidence trick', and may stigmatize as 'mimicry' something that the historian, the poet, or the painter, for their part, might prefer to call 'imagination'. But the philosopher's magisterial censure is a cheap price to pay for the benefits of the same philosopher's unintentional 'tip'—as will be evident if we come to our hard-pressed historian's rescue with Lewis Carroll's benevolent 'time-machine'.¹

Let us make sure that our historian has taken Plato's back-handed hint to give his imagination free play, and then let us see him off again on his journey from New York to Princeton. He buys his ticket, catches his train, registers at his hotel, and works up his feelings by thinking of a recent income-tax demand-note, all just as before; but at this critical point, instead of rushing out into the streets, yataghan in hand, and decapitating the first foot-passengers that he meets, like a Spartiate Cleomenes in the streets of a Ptolemaic Alexandria,² he stalks out into the garden, walking-stick in hand, and decapitates the first dandelions that catch his eye—and, if the useful occupation of weed-killing fails to strike in him the requisite Tamerlanian spark, he can proceed to make a glorious massacre of the sun-flowers and handsomely indemnify the hotel management for their pecuniary loss without any risk of finding himself on the wrong side of the Law. If he then goes back indoors, sits down at his writing-desk, and indites his history of Tamerlane's life and works, his ingenuous reader (*teste Platone*) will never know that the heads which the historian duly cut off, in order to put himself in the proper mood for doing his job, were not human, but only floral. We can be reasonably confident of the plausibility of the impression that Timur Lenk's unscrupulously unhomocidal imaginative historiographer will contrive to make, since we have no evidence that Christopher Marlowe ever took any more drastic steps than those suggested here when he was working himself up to write his *Tamburlaine the Great*.

But what is this faculty of Imagination which makes it possible, after all, for an historian to participate in Timur Lenk's experience without his having to re-experience it in real life? Are the historian, the painter, and the poet really practising on the public the fraud of which Plato accuses them half in earnest? Are they really palming off appearance as reality, and getting something for nothing out of their professional activities at the price of sacrificing their moral integrity? The truth is that the exercise of the Imagination is something that is quite as familiar as it is mysterious. It is not just a professional trick of a literary and artistic trade; it is an indispensable means of social intercourse between ordinary people in every-day life; and, since Sub-Man had to become a social animal before he could become fully human,³ it is no exaggera-

¹ See V. vi. 214.

² See V. vi. 391.

³ See I. i. 173.

tion to say that a constant use of the Imagination is one of the primary necessities of life for the Human Race, and that, if Mankind were to take Plato's castigation seriously enough to pluck this vital faculty out and cast it from them, they would be sentencing themselves to the doom of the legendary Kilkenny Cats.

While Plato pillories the Imagination by stigmatizing its exercise as a fraud practised by painters and poets on the public, Collingwood saves the historian's reputation, according to Collingwood's own lights, by ruling out any psychic activity other than thought about thought from his definition of what constitutes the historian's legitimate business. In thus committing himself to a doctrine that cannot be reconciled with the facts, Collingwood has fallen a victim to a common human infirmity. Each of us is prone to exaggerate the importance of the organ or faculty or activity—hand, ear, or eye; sensation, intuition, or feeling; will or thought—that happens to be the principal instrument or medium of his own dealings, personal or professional, with his fellow human beings; and Collingwood the historian has been led up this prim garden path by Collingwood the philosopher. An idolization of thought is the philosopher's idolatrous sacrifice on the altar of his professional patriotism;¹ but it is as true in the Academy as it is in the world outside its garden walls that 'patriotism is not enough';² for there are always more things in Heaven and Earth than are dreamt of in the philosophy of any of our Horatios.³

¹ Collingwood has also laid a wreath on the Imagination's cenotaph, but he has nullified the signature of this tribute by the terms in which he has composed his inscription. The idea, he declares (op. cit., p. 249) that governs an historian's work 'is the idea of the Historical Imagination as a self-dependent, self-determining, and self-justifying form of—thought [*sic*]'.

³ Shakspeare: *Hamlet*, Act I, scene 5.

WAS THERE A RENAISSANCE OF MINOAN RELIGION IN HELLENIC HISTORY?

IN the pre-Alexandrine Age of Hellenic history there were several religious movements that were felt by the Hellenes at the time to be, in some sense, exotic. The chief instances were the worship of Dionysus, the rites, poems, and ideas associated with the name of Orpheus, and the Pythagorean School of Philosophy. If some, at any rate, of the elements in these divers religious practices, experiences, and beliefs were un-Hellenic in reality, there were two different possible quarters from which they might have made their way into Hellenic life. Either they might have been introduced through the radiation of some living contemporary non-Hellenic culture or cultures with which the Hellenic World was already in contact in the pre-Alexandrine Age—as it is notorious that a number of alien religious influences were introduced subsequently, in the sequel to the overthrow of the Achaemenian Empire by Alexander—or alternatively such un-Hellenic religious phenomena in a pre-Alexandrine Hellas might have been, not importations from living contemporary societies, but evocations of ghosts from the dead past of an antecedent civilization to which the Hellenic was affiliated. The hypothesis of an Hellenic renaissance of Minoan religion has been found convincing—at least as far as the worship of Dionysus is concerned—by one of the most eminent of the twentieth-century Western authorities on the subject.

“The ecstatic cult of Dionysos, which spread all over Greece in the Archaic Age, was a powerful religious movement. I venture to think that its strength is better understood if we assume that it was not an importation of a completely foreign god and form of religion but the revival of old Minoan and Mycenaean religious ideas, and perhaps also rites, which had for a time fallen into the background. The ideas peculiar to the Minoan religion were suppressed under the overwhelming onset of the gods and religious ideas which the [Achaean barbarian] conquerors brought with them; but, just as the old gods did not vanish but mingled with the newcomers, so the old religious ideas persisted in secret. When the opportunity arose they emerged once more to cause a religious revolution, the occasion being the acceptance of a foreign cult with kindred ideas of a mystic character. This was the Thracian worship of Dionysos combined with the Phrygian form of the same cult, which had already been transformed through the influence of the native religion of Asia Minor, which in its turn also contained elements of Minoan origin, identical with or similar to Minoan ideas which still survived in Greece.”¹

In the historical perspective of a latter-day Western historian, this hypothetical renaissance, in Hellenic history, of supposedly repressed elements of Minoan religion would have counterparts in the historic

¹ Nilsson, M. P.: *The Minoan-Mycenaean Religion and its Survival in Greek Religion* (London 1927, Milford), p. 504.

renaissances, in Orthodox and in Western Christian history, of a Judaism embedded in a Christianity that was these two Hellenistic civilizations' religious heritage from their Hellenic predecessor. This analogy, however, so far from corroborating Nilsson's view, actually militates against it *a priori*; for the hypothesis that there has been a renaissance of some element of an antecedent civilization's religion in the history of an affiliated civilization pre-supposes the survival, through an intervening social interregnum, of a religious tradition in which the eventually resuscitated element of an earlier religion has been latent all the time; and in a previous context¹ we have found reason to believe that a religious link of this kind, such as is provided by a chrysalis church, between two civilizations of different generations is the distinctive mark of the historical relation between a civilization of the second generation and one of the third—as, for example, the Orthodox and Western Christian civilizations were affiliated to the Hellenic through the link provided by Christianity. By contrast, the normal link between a civilization of the first generation, such as the Minoan, and a successor in the second generation, such as the Hellenic, seems to be, not a chrysalis church, but an external proletariat; and in a previous inquiry, after we had raised the question whether a religious legacy from a Minoan past was to be detected in 'Orphism',² our judgement inclined tentatively towards the alternative view³ that the un-Hellenic elements in 'Orphism', if such there were, were not revivals of a Minoan past, but were importations into Hellas from the contemporary Syriac and Indic worlds.

Between the date of publication of the fifth volume of this Study in A.D. 1939 and the date of writing of the present Annex in A.D. 1950, our doubts about the hypothesis of an Hellenic renaissance of Minoan religion had been confirmed by the authoritative verdict of a lucid-minded scholar who had re-examined all the extant historical evidence regarding 'the arts of Orpheus' by a stringently scientific method.⁴ Professor Linforth's most significant conclusion is the negative one that there is no cogent evidence for there ever having been anything in the nature of an institutionally organized 'Orphic Church', or even anything in the nature of a systematic body of Orphic doctrine;⁵ and he finds no 'trustworthy support' for the view, which had received some countenance in previous works of scholarship,⁶

'that the teletae and the poem of the dismemberment [of Dionysus] were actually the work of Onomacritus, and that therefore "the Orphic Religion" originated in Athens, or was introduced into Athens, in the time of Peisistratus.'⁷

In the dry light of Linforth's salutarily ruthless criticism of theories without warrant in the sources, the supposed evidence for the presence of Syriac and Indic elements in pre-Alexandrine Orphic rites, poems,

¹ In VII. vii. 392-419.

² See V. v. 82-87 and 697-8.

⁴ See *ibid.*, pp. 288, 291, 304-5, and 356.

⁵ See the references in V. v. 697-8.

⁶ See I. i. 95-100.

⁷ Linforth, *op. cit.*, p. 353.

and ideas dwindle almost to the vanishing-point at which the supposed evidence for the presence there of Minoan elements quite disappears from view.

Scepticism can, of course, be carried to an extreme at which it becomes more paradoxical than credulity; and, if there were incontrovertible evidence, as there seems in fact to be,¹ that in a pre-Alexandrine Hellenic World a belief in the transmigration of souls under stress of *Karma*,² and a prescription for winning release from a melancholy round of successive reincarnations, were current in Pythagorean, Orphic, or any other philosophical or religious circles, it would seem decidedly more improbable that these practices and doctrines had been worked out in the Hellenic World independently than that they had been derived by the Hellenes from the Indic World through the culturally conductive medium of the Achaemenian Empire.³ Moreover, whatever the source or sources of the philosophy of Pythagoras and of the 'miscellaneous' and 'disparate'⁴ 'arts of Orpheus'⁵ may have been, it has still to be explained why a pre-Alexandrine Hellenic Society should ever have welcomed and promoted movements that were certainly felt to have in them at least a touch of something alien. An explanation suggested in a previous passage of this Study⁶ was that 'Orphism' proved attractive to Hellenic souls because it promised to fill a fearful spiritual void; and, since the publication of Linforth's book, this idea, at least, can be entertained with somewhat greater assurance, since it has received the *nihil obstat* of a scholar who has placed so many other once cherished notions on a scientific censor's index.

'If we look for a wider unity in the things that bore the name of Orpheus, we may perhaps find that they are the expression of a particular aspect of the religious instinct among the Greeks. The practice of the public cults involved little or no religious speculation and was not developed to meet the deeper religious needs of the individual. Greek poetry—epic, lyric, and dramatic—full as it was of gods and myths and profound thought on the relations between gods and men, was secular rather than hieratic. Philosophy, though it touched Religion at many points and became more and more a guide for the moral life, was primarily intellectual and divorced from religious practice. Meantime, the common human need required a religion in which practice and belief would be united, a religion which would allay the concern which men individually felt for their spiritual welfare, in this life and the next. This need was met by the things that bore the name of Orpheus, the comfortable rites of the mysteries, with the doctrines that were implicit in them, and the poems which gave expression to the doctrines and supplied authority for the rites.'

¹ As, for example, in Pindar's Second Olympian Ode, ll. 62-91 (according to the numbering in Christ's edition), and in the myth at the end of the Tenth Book of the *Republic*. If the inspiration of these passages was not Orphic, it must have been Pythagorean.

² The Indic conception of *Karma* has been noticed in V, v. 432-3.

³ If the philosophy of the Buddha was indeed the original source of these pre-Alexandrine Hellenic notions, it had suffered lamentable spiritual damage *en route*. For instance, the perfect freedom of an Indic *Nirvāṇa*, which was the ethereal goal of the would-be arhat, had been jettisoned in favour of the sensuous delights of an Egyptian Elysium.

⁷ Linforth, *op. cit.*, p. 305.

XII. B (ii) ANNEX

A CRITIQUE OF GIBBON'S GENERAL OBSERVATIONS ON THE FALL OF THE ROMAN EMPIRE IN THE WEST

IN the chapter to which this annex attaches, three passages of this analytical parenthesis in Gibbon's narrative have been quoted as classical expressions of an eighteenth-century Western spirit of complacency.¹ Gibbon's analysis, however, throws light, not only on the outlook of a cultivated minority in the Western World of his day, but also on the prospects of his generation's and his society's successors mid-way through the twentieth century, after the lapse of some 170 years or more since the date—some time between A.D. 1772 and A.D. 1781²—when Gibbon's 'General Observations' were drafted. The last six of the ten paragraphs of which these observations consist are devoted to a comparison, point by point, between the state of the Hellenic Society at the time of the fall of the Roman Empire in the West, in the fifth century of the Christian Era, and the state of the Western Society at the time when Gibbon was writing—which was during the lull between the close of the Seven Years War in A.D. 1763 and the outbreak of the Revolutionary and Napoleonic Wars in A.D. 1792. The points that Gibbon brings up as topics for comparison are so well chosen, and his estimates, point by point, of the Western Civilization's prospects in his day are so illuminating for any mind attempting to make corresponding estimates five or six generations later,³ that, in the present Annex to a Part of this Study dealing with the prospects of the Western Civilization in the twentieth century, the writer has reprinted the synoptic paragraphs of Gibbon's observations with a twentieth-century commentary on each of them, in the belief that he could have found no more effective way of prosecuting his own inquiry.

The fifth paragraph of Gibbon's observations, which opens with a passage quoted already in the main body of the present Part,⁴ may now be reprinted in full.

'This awful revolution may be usefully applied to the instruction of the present age. It is the duty of a patriot to prefer and promote the exclusive interest and glory of his native country: but a philosopher may be permitted to enlarge his views, and to consider Europe as one great republic, whose various inhabitants have attained almost the same level of politeness and cultivation. The Balance of Power will continue to fluctuate, and the prosperity of our own or the neighbouring kingdoms may be alternately exalted or depressed; but these partial events cannot essentially injure our general state of happiness, the system of arts, and laws, and manners,

¹ See pp. 424 and 425, above.

² See IV. iv. 148, n. 3.

³ The original notes for the present Annex were drafted, not in A.D. 1950, but in A.D. 1929.

⁴ On p. 424, above.

which so advantageously distinguish, above the rest of Mankind, the Europeans and their colonies. The savage nations of the globe are the common enemies of Civilised Society; and we may inquire, with anxious curiosity, whether Europe is still threatened with a repetition of those calamities which formerly oppressed the arms and institutions of Rome. Perhaps the same reflections will illustrate the fall of that mighty empire, and explain the probable causes of our actual security.'

In this paragraph Gibbon enunciates the argument that governs the remainder of his observations: The Western World is now not exposed to the possibility of a breakdown from within; the only danger by which it might conceivably still be threatened is that of another attack by barbarians from the outer darkness; and, since this danger does not now appear to be a serious one, the Western World may consider itself secure.

The major premiss of this argument—a premise which Gibbon simply takes for granted—would be challenged by a twentieth-century Western inquirer who had lived to see the history of his own society demonstrate, in its turn, that 'we are betrayed by what is false within.'¹ In the light of this first-hand experience it was easier for a twentieth-century Western historian than it had been for his eighteenth-century predecessor to see that the breakdowns of all the civilizations that had broken down by Gibbon's time, not to speak of a date some 170 years later, had been due to inward spiritual failures and not to outward physical blows. We need not labour a point that we have already illustrated at length in an empirical survey.² If Gibbon had taken this point, he would have divined that the decline and fall of the Roman Empire had been no more than an episode, and this a late one, in the decline and fall of the Hellenic Civilization; and he would have detected the cause of the downfall, not in 'the triumph of Barbarism and Religion' in the Roman Empire in the fourth and fifth centuries of the Christian Era, but in the fratricidal warfare between the parochial city-states of Hellas in the fifth century B.C.³

After filing this notice of dissent we may go on to Paragraph Six:

'The Romans were ignorant of the extent of their danger and the number of their enemies. Beyond the Rhine and Danube the northern countries of Europe and Asia were filled with innumerable tribes of hunters and shepherds, poor, voracious, and turbulent; bold in arms, and impatient to ravish the fruits of industry. The Barbarian World was agitated by the rapid impulse of war; and the peace of Gaul or Italy was shaken by the distant revolutions of China. The Huns, who fled before a victorious enemy, directed their march towards the West; and the torrent was swelled by the gradual accession of captives and allies. The flying tribes who yielded to the Huns assumed in *their* turn the spirit of conquest; the endless column of barbarians pressed on the Roman Empire with accumulated weight; and, if the foremost were destroyed, the vacant space was instantly replenished by new assailants. Such formidable emigrations no longer issue from the North; and the long repose, which has been imputed to the decrease of population, is the happy consequence of the progress of arts and agriculture. Instead of some rude villages thinly scattered among its woods and morasses, Germany now produces a list of

¹ George Meredith, quoted in IV. iv. 120 and VI. vii. 46, n. 6.

² In IV. iv. 119-584.

³ See IV. iv. 58-63.

two thousand three hundred walled towns; the Christian kingdoms of Denmark, Sweden, and Poland have been successively established; and the Hanse merchants, with the Teutonic knights, have extended their colonies along the coast of the Baltic as far as the Gulf of Finland. From the Gulf of Finland to the Eastern Ocean, Russia now assumes the form of a powerful and civilised empire. The plough, the loom, and the forge are introduced on the banks of the Volga, the Oby, and the Lena; and the fiercest of the Tartar hordes have been taught to tremble and obey. The reign of Independent Barbarism is now contracted to a narrow span; and the remnant of Calmucks or Uzbecks, whose forces may be almost numbered, cannot seriously excite the apprehensions of the great republic of Europe.¹ Yet this apparent security should not tempt us to forget that new enemies and unknown dangers may *possibly* arise from some obscure people, scarcely visible in the map of the World. The Arabs or Saracens, who spread their conquests from India to Spain, had languished in poverty and contempt till Mohamet breathed into those savage bodies the soul of enthusiasm.

A twentieth-century Western observer would find no difficulty in agreeing with Gibbon that the Western World was unlikely ever again to be successfully invaded by barbarians from any no-man's-land beyond its borders; for, if Gibbon had lived to see the offensive power of the Eurasian Nomads broken at last, after a 3,500-years-long series of explosions, by the Manchus' overthrow of the Zungar Calmucks in A.D. 1755² and the flight of the Torgut Calmucks in A.D. 1771 from a Great Western Bay of the Eurasian Steppe where the Russians had reasserted the ascendancy of a sedentary civilization, Gibbon's twentieth-century successors had lived to see the last of the barbarians—in the highlands as well as on the steppes—followed up and subjugated in the last of their fastnesses.³ Gibbon's doubts about the stability of the Manchu Empire were to be proved prescient by the swiftness of its decline and fall after the death of Gibbon's own contemporary the Emperor Ch'ien Lung (*imperabat* A.D. 1735–96); but the beneficiaries from this decay of the Manchu power were not to be the Calmucks or any other Eurasian Nomads; they were to be Russia along the disintegrating empire's continental frontiers and the maritime Powers of the Western World along its coasts; and a twentieth-century Western observer might feel justified in venturing to leave out of his reckoning Gibbon's *caveat* 'that new enemies and unknown dangers' might '*possibly* arise from some obscure people, scarcely visible in the map of the World'. This conclusion, however, would bring with it no sense of security to a twentieth-century Western historian who dissented from Gibbon's thesis that the barbarians had been responsible for the overthrow of the Roman Empire;

¹ [in the original, 6]. 'The French and English editors of the Genealogical History of the Tartars have subjoined a curious, though imperfect, description of their present state. We might question the independence of the Calmucks, or Eluths, since they have been recently vanquished by the Chinese, who, in the year 1759, subdued the lesser Bucharina, and advanced into the country of Badakshan, near the sources of the Oxus (*Mémoires sur les Chinois*, tom. 1, pp. 325–400). But these conquests are precarious, nor will I venture to ensure the safety of the Chinese Empire.'

² See Courant, M.: *L'Asie Centrale aux XVII^e et XVIII^e Siècles: Empire Kalmouk ou Empire Mantchou?* (Paris 1912, Rey), pp. 101–17.

³ See V. v. 332–4, and pp. 450–1, above.

and, if the twentieth-century Western inquirer held the opposing view that the Roman Empire itself was merely a symptom of the decline and fall of an Hellenic Civilization which had been betrayed from within, and this four hundred years before the tardy establishment of a *Pax Augusta*, then this latter-day Western investigator would find no consolation in being able to endorse Gibbon's judgement that the Western Civilization was unlikely ever to be overthrown by barbarian arms. He would find this conclusion cold comfort because he would find it irrelevant to his and Gibbon's common problem.

In attempting to estimate the Western Civilization's prospects, the twentieth-century Western student of History might be expected to concentrate his attention on the question whether a betrayal by something false within—which had been, as he saw it, the true cause of the Hellenic Civilization's downfall—was or was not likely to bring the Western Civilization to the same tragic end; and in this inquiry the elimination of a former menace from the Barbarians would be beside the point for several telling reasons. In the first place a ubiquitously expanding Western Society's external proletariat had been eliminated, for the most part, not through being annihilated, but through being transferred from the external to the internal proletariat's ranks, and this Western internal proletariat had been reinforced simultaneously by the conscription into it, *en masse*, of the populations of all the extant non-Western civilizations.¹ In the second place the possibility that the Western Civilization, like the Hellenic, might be betrayed by something false within had been brought home by the appalling experience of seeing a vanishing barbarian's most evilly barbarous propensities reappearing—in reproductions that were far more sinister than the original—among superficially Westernized children of non-Western civilizations that had been caught in the Western net and—most terrifying portent of all²—among native sons and heirs of the Western Civilization's promise.³

Gibbon had been gratified to observe that 'the fiercest of the Tartar hordes have now been taught to tremble and obey' by Russian converts to the Western Civilization who, by mastering a Western technique, had made themselves into efficient wardens of anti-Nomad marches, to the Western World's advantage as well as to Russia's. It had not occurred to Gibbon that the introduction of 'the plough, the loom, and the forge . . . on the banks of the Volga, the Oby, and the Lena', which in his time was serving the Western World's convenience by making the Nomads tremble and obey, might be employed one day by the same now irrevocably Western-fingered Russian hands for the inconvenient purpose of putting the same fear and trembling into Western hearts.

A fortiori, it had not occurred to an English historian who was a contemporary of King Frederick II of Prussia that a Germany producing 'a list of two thousand three hundred walled towns' might present a greater threat to the Western World, if Germany's rulers and leaders repudiated the moral standards of the Western Civilization, than 'rude villages scattered among' Germany's 'woods and morasses', in a no-man's-land

¹ See V. v. 152-3, and pp. 413-15, 451-2, and 489, above.

³ Heb. vi. 17 and xi. 9.

beyond the *limes* of the Roman Empire, had ever presented to an Hellenic World which had been successfully defended against primitive barbarian German assaults by this Roman military rampart for some four hundred years, and which might never have succumbed, and indeed never even have been exposed, to a German peril if, four hundred years before the date at which the Roman *limes* was established, Hellas had not been betrayed by something false within. The unreclaimed barbarian beyond the pale is a negligible danger to a civilization by comparison with the apostate son and heir¹ who has deliberately looked back after having put his hand to the plough;² and Frederick's unprincipled attack on the dominions of Maria Theresa in A.D. 1740, within Gibbon's own lifetime, was the first step in a German *descensus Avernii* which was to reach the bottom of the infernal pit in A.D. 1933-45. If a Western people which had played so capital a part as the Germans had played in the long and hard task of building up a Western Christian Civilization could fall so low as this, no guarantee of immunity against future aggression by a straightforward barbarism from abroad could make up to the Western World for its now proven exposure to betrayal by a morally perverse barbarism within its own bosom.³

'The empire of Rome was firmly established by the singular and perfect coalition of its members. The subject nations, resigning the hope, and even the wish, of independence, embraced the character of Roman citizens; and the provinces of the West were reluctantly torn by the Barbarians from the bosom of their mother-country.⁴ But this union was purchased by the loss of national freedom and military spirit; and the servile provinces, destitute of life and motion, expected their safety from the mercenary troops and governors who were directed by the orders of a distant court. The happiness of an hundred millions depended on the personal merit of one or two men, perhaps children, whose minds were corrupted by education, luxury, and despotic power. The deepest wounds were inflicted on the empire during the minorities of the sons and grandsons of Theodosius; and, after those incapable princes seemed to attain the age of manhood, they abandoned the church to the bishops, the state to the eunuchs, and the provinces to the Barbarians. Europe is now divided into twelve powerful, though unequal, kingdoms, three respectable commonwealths, and a variety of smaller, though independent, states; the

¹ On this point, see V. v. 334-7, where it is illustrated by the citation of an Italian neobarbarism which had not yet been eclipsed by a still darker German neobarbarism at the time when that passage of this book was written.

² Luke ix. 62.

³ 'Vevey [1875].

⁴ 'There is a perfect little woman here, mother of a fair-haired child, niece of Gortschakoff. She smokes cigarettes, very small, very elegantly. She told me that Ignatieff never by any chance told the truth. It is a proverb in Russia: "Il ment comme Ignatieff".'

'She was mentioning the overthrow of previous civilisations by barbaric forces; and we came to the conclusion that it was unlikely that the Tartars, who seem the only available barbarians, would stamp out the civilisation, extended as it is over the World. She expressed her belief that the dark force is developed with the brightness of prosperity all-pervading now; and then suggested that what could provide a force strong, ignorant, barbarian, and widespread, is the lower populations of the various nations of Europe grouped in some such society as the International Inbred with communistic and destructive notions' (*Journals and Letters of Reginald Viscount Esher*, ed. by M. V. Brett, vol. i (London 1934, Nicholson & Watson), p. 34). This passage was brought to the present writer's attention by his friend J. L. Hammond on the 3rd September, 1934.

⁴ [in the original, 7] 'The prudent reader will determine how far this general proposition is weakened by the revolt of the Isaurians, the independence of Britain and Armorica, the Moorish tribes, or the Bagaudae of Gaul and Spain.'

chances of royal and ministerial talents are multiplied, at least, with the number of its rulers; and a Julian, or Semiramis, may reign in the North, while Arcadius and Honorius again slumber on the thrones of the South. The abuses of tyranny are restrained by the mutual influence of fear and shame; republics have acquired order and stability; monarchies have imbibed the principles of freedom, or, at least, of moderation; and some sense of honour and justice is introduced into the most defective constitutions by the general manners of the times. In peace, the progress of knowledge and industry is accelerated by the emulation of so many active rivals: in war, the European forces are exercised by temperate and undecisive contests. If a savage conqueror should issue from the deserts of Tartary, he must repeatedly vanquish the robust peasants of Russia, the numerous armies of Germany, the gallant nobles of France, and the intrepid freemen of Britain; who, perhaps, might confederate for their common defence. Should the victorious Barbarians carry slavery and desolation as far as the Atlantic Ocean, ten thousand vessels would transport beyond their pursuit the remains of Civilised Society; and Europe would revive and flourish in the American World, which is already filled with her colonies and institutions.¹

In this brilliant appreciation of the cost, in loss of liberty, initiative, and variety, which is the price of gaining unity and fraternity under the aegis of an oecumenical empire, Gibbon is implicitly contradicting his own major thesis that the Antonine Age had been the Golden Age of Hellenic history. Yet even in the present passage he shows no sign of any awareness of the obvious truth that, if, in the generation of Augustus, the Hellenic World did bring itself to buy unity and fraternity at an exorbitant price, this purchase must have come, by Augustus's day, to be a matter of life and death for the Hellenic World. In other words, Gibbon fails to recognize the two historical truths that the *Pax Augusta* was a disintegrating Hellenic Society's tardy response to the challenge of a four-hundred-years-long Time of Troubles and that the weak points, as well as the strong points, of the Roman Empire only become intelligible when they are viewed against this historical background; and his blindness to these two truths is the penalty for an antecedent failure to recognize a prior truth; for he has also failed to recognize that an Hellenic Time of Troubles which had preceded and evoked the organization of a Roman Peace had arisen out of the breakdown, in the fifth century B.C., of a felicitous but also precarious equilibrium between the two conflicting social forces of oecumenicalism and parochialism which had been a counterpart, in fifth-century Hellas, of the delicate equilibrium between the same two forces in the Western World of Gibbon's day.

The virtues of this régime of diversity-in-unity, which have been indicated by Gibbon in an introductory paragraph already quoted in this Annex, are enlarged upon in the present paragraph with the same masterly touch. Yet, in spite of the fact that the parallel between a classical Hellas and an eighteenth-century Western Christendom is explicitly

¹ [in the original, §] 'America now contains about six millions of European blood and descent; and their numbers, at least in the North, are continually increasing. Whatever may be the changes of their political situation, they must preserve the manners of Europe; and we may reflect with some pleasure that the English language will probably be diffused over an immense and populous continent.'

pointed out in the works of two of Gibbon's own contemporaries, Hume¹ and Turgot,² Gibbon himself has not drawn the obvious moral for the prospects of his own civilization from the tragic historical fact that the once beneficent diversity-in-unity of a Classical Hellenic body social—whose parochial sovereign states had brought themselves to 'confederate for their common defence' in the crisis of 480–479 B.C.—eventually fell so desperately out of joint that a long-tormented Hellenic society came, at last, to acquiesce in the hardly less desperate remedy of replacing a dislocated constellation of parochial Powers by one single universal state. In the light of this tragic episode of Hellenic history, it would be no paradox to suggest that the foundation of the Roman Empire was a more 'awful revolution' than its fall. Yet, familiar though Gibbon was with the plot of this pre-Augustan Hellenic tragedy, he seems never to have inferred from it the possibility that the diversity-in-unity of an eighteenth-century Western body social might be exposed to the same danger of going awry.³

Another disagreeable contingency that Gibbon overlooks in this passage is the possibility that the effect of social conductivity may be equivocal. He perceives that the Western body social of his day is conductive in virtue of the unity underlying the diversity in its constitution, but he tacitly makes the assumption that the political qualities which one member of a Western family of states will acquire from another can only be those that happen to be desirable in his estimation. The same assumption was still being made, a hundred years and more after Gibbon's time, by British, American, French, and Belgian practitioners of a parliamentary representative form of constitutional government which its votaries labelled 'Democracy'.⁴ At the turn of the nineteenth and twentieth centuries it was being taken for granted in 'democratic' Western countries that 'Democracy' was destined to supplant all other forms of government, not only in still 'undemocratic' Western countries, but in the World at large. But after the lapse of yet another half-century this optimistic assumption had come to seem naïve to Western observers who had seen the tide of 'Democracy', in the Western meaning of the word, begin to ebb on the morrow of a First World War which had been fought and won in order 'to make the World safe for Democracy', in the words of President Wilson's accurate description of the Western Allied and Associated Powers' principal war-aim.⁵ Since A.D. 1919 'the general manners of the times' had been furthering the propagation, from one state to another, of the principles and practice, not of parliamentary democracy, but of Communist and Fascist totalitarianism; and in the

¹ In his essay *Of the Rise and Progress of the Arts and Sciences*, quoted in II. i. 473–4. Hume had been anticipated by Sprat, T.: *The History of the Royal Society* (London 1667, Martyn), pp. 22–23.

² In his *Second Discours sur les Progrès Successifs de l'Esprit Humain*, delivered on the 11th December, 1750, which has been cited *ibid.*

³ This inference was obvious to a Western observer taking his bearings some 170 years after Gibbon's time, when a constitutional weakness in the structure of a Modern Western body social, to which Gibbon's genius had been blind, had become too flagrant to escape the notice of even the dullest understanding. There is, of course, no need to be a genius in order to be wise after the event.

⁴ See I. i. 2.

⁵ President Woodrow Wilson in his address to the Congress of the United States on the 2nd April, 1917.

mouth of a believer in constitutional government this statement of an indisputable historical fact was tantamount to a confession that, in these latter days, the abuses of tyranny were proving more infectious than the principles of freedom or even of moderation. In a dolorous twentieth century any citizen of a Western community that was then still partitioned among a host of warring parochial states would have been content to see Arcadius and Honorius slumber harmlessly on their thrones without itching to see their sleep disturbed by the pernicious activities of wakeful neighbours; for in an age in which Gibbon's Julian had turned out to be a Phocas, and his Semiramis a Sennacherib, political dynamism was at a discount.¹

Gibbon's dictum that 'in war the European forces are exercised by temperate and undecisive contests' conveyed in one sentence to the ears of Gibbons's successors in A.D. 1952 the full measure of the change for the worse in the Western Civilization's prospects since Gibbon's day. We need not enlarge here on a point that we have already taken to heart in a number of previous contexts.² Since A.D. 1914 Europe had become a Westernizing World's battlefield.³ We need only add that, since the inter-war dates at which those earlier passages of the present Study had been published, the disillusioning flow of Time had also brought with it a refutation of Gibbon's complementary thesis that 'in peace the progress of knowledge and industry is accelerated by the emulation of so many active rivals'; for the suspension of hostilities at the close of a Second World War had been anticipated by the dropping of two atomic bombs; and this horrifying triumph of a marvellous post-Modern Western scientific technique had marked the beginning of the end of an era of free scientific research and discussion which had now brought forth this satanic *chef-d'œuvre* after two and a half centuries of gestation.

This epoch of Western history had opened at the turn of the seventeenth and eighteenth centuries of the Christian Era with the liberation of scientific inquiry from the intellectual bonds of a Christian theology that had been clamped upon it some thirteen hundred years earlier under the auspices of the Christian Roman Emperor Theodosius I (*imperabat* A.D. 379-95); and, during a subsequent quarter of a millennium in which Science had been enjoying a freedom that was her life-breath, her volac-

¹ 'Benevolent government is rarely associated with a ruler whose mind is over-alert and intelligence over-developed. Benevolence is most commonly found in rulers who are easy-going or who behave as if they were. The worst defect in the alert-minded ruler is that he lays burdens upon his subjects which are greater than they can bear; and he does this because his mental vision outranges theirs and because his insight penetrates to the ends of things at the beginnings—with disastrous consequences for them. The Prophet says: "Go the pace of the weakest among you"; and in this context the exponent of the Divine Law prescribes in the case of rulers that excess of intelligence should be avoided . . . because it produces oppression and bad government and makes demands upon the people which are contrary to their nature. . . . It is evident from this that intellectuality and intelligence is a fault in an administrator, because this is an excess of mental activity—just as dull-wittedness is an excess of mental torpidity. The two extremes are to be deprecated in every attribute of Human Nature. The ideal is the Golden Mean. . . . And for this reason a man who is over-intellectual has Satanic attributes attributed to him and is called "Satan", "possessed by Satan", and so on' (Ibn Khaldūn: *Muqaddamāt*, Book I, chap. xxiv).

² See, for example, III. iii. 311; IV. iv. 148, 189, and 283.

³ See III. iii. 303-4, and *Civilization on Trial* (London 1948, Oxford University Press), pp. 97-125: 'The Dwarfing of Europe'.

ries had never suspected that their liberation from the theological censorship of an oecumenical church was to be followed after a season by their subjection to the political control of a litter of sovereign independent parochial states. This twentieth-century forfeiture of a Western Science's intellectual freedom was the penalty for a Western Technology's practical success; for Science had been supplying Technology with edged tools; these tools were bound to be used and misused as weapons in a world that was partitioned among parochial states prone to go to war with one another; and, when Science had once furnished Technology with the 'know-how' for forging a weapon of the potency of the atomic bomb, any parochial government that possessed or aspired to acquire this 'know-how' was bound, on categorically imperative grounds of military security, to make this deadly knowledge a state secret and in consequence to bring the intellectual activities of atomic scientists under politico-military control.

Thus, on the morrow of 'V-J Day', A.D. 1945, the scientific workers of the Western World had woken up to find themselves conscripted into the secret service of this or that parochial state, whichever state might happen to be able to claim this or that scientist as its subject. And this political enslavement proved to have been only the milder of two calamities that had overtaken the men of science on that day of horror. The subjection of their scientific work to a political control was bound, no doubt, in the long run, to sterilize their flow of intellectual creativity; but this strangulation of their intellects by the dead hand of the secret police was a light affliction¹ compared with the *peine forte et dure* that was being inflicted on their consciences by a crushing sense of guilt and remorse. From the close of the seventeenth century of the Christian Era till the 15th August, 1945, a post-Christian school of Late Modern Western physical scientists had been casting upon the waters² a series of socially and morally subversive intellectual discoveries in a blind belief that any increase in Man's knowledge of, and command over, Physical Nature was an absolute good which was bound to bring in profitable returns, without regard to the human effect of this new inhuman knowledge and power upon the social milieu into which it was being spawned. In the ears of these prodigally irresponsible devotees of a renascent Athena, the explosion at Hiroshima on the 6th August, 1945, had reverberated with the sound of the Last Trump. A blast that had rent the veil under which they had been content hitherto to leave their goddess's ambiguous countenance hidden had suddenly confronted them with reality and convicted them of sin; and an inward spiritual monitor that might help a mortified soul to work out its personal salvation in the long run was a harsher taskmaster in the short run than the merely external tyranny of the security police.

In these circumstances, Gibbon's thesis that, during suspensions of international hostilities, the progress of knowledge and industry is accelerated by international competition could no longer carry conviction. But in the context of Gibbon's General Observations this thesis is only a parenthesis. The particular virtue of political diversity-in-unity that is

¹ 2 Cor. iv. 17.

² Eccl. xi. 1.

Gibbon's principal theme in this paragraph is the military effect of 'temperate and undecisive contests' between Western parochial states in exercising them for the common military task of meeting 'the Yellow Peril', if the Nomads should ever again break westwards out of the Great Eurasian Steppe. In the improbable event of these hypothetical aggressors from the heartland of the Old World overcoming the resistance of each and all of the mutually independent sedentary peoples living between the European shore of the Steppe and the Atlantic coast of Europe, Gibbon imagines 'the remains of Civilised Society' seeking and finding asylum in an America which by his time had already become a second home of the Western Civilization.

By Gibbon's time a series of waves of refugees, as well as *conquistadores*, from Western Europe had, in truth, already broken on the coasts of a New World where these *déracinés* had found themselves able to strike fresh root, and this stream of Transatlantic migration was to flow on, in greater volume and at a faster pace, for another 140 years after the date at which Gibbon was writing. But neither the Pilgrim Fathers nor 'the Forty-Eighters' were victims of 'the Tartar hordes'; and, if in A.D. 1952 'the remains of Civilised Society' on the European Peninsula of Asia were hoping once again—and this for the third time in one lifetime—that America was going to play the part of arsenal and citadel of Democracy on behalf of European peoples 'who perhaps might confederate for their common defence', this was not because the European homeland of the Western Civilization was having to face the prospect of another Nomad attack. This once perennial peril had never loomed up again since A.D. 1237–41, when the dreaded advance of Bātū Khan's expeditionary force had moved the herring-fishermen of Friesland and Gothland to stay ashore, mounting guard over their homes and families, while the whole season's catch of the year 1238 glutted the market in a snugly insular England.¹ In the general wars of A.D. 1914–18 and 1939–45 the aggressors whose ambitions had been frustrated by the intervention of the United States had been, not Nomad Mongols, but urban Germans; and, though in December 1950 Mongol cavalry were operating in Korea as auxiliaries of an intervening Chinese Communist army, it was not the Mongols, but the Russians, who were playing the aggressor's part in this fateful year. Thus a persisting partition of the Western World among a litter of warring parochial states, in which Gibbon had seen a salutary insurance against the chimaerical danger of a resurgence of the Nomads, had actually opened the way for a betrayal of the West European sanctuary of Western culture to an enemy within the gates. In Gibbon's order of battle against a Nomad offensive, 'the robust peasants of Russia' are posted in the first line of the defending forces, and 'the numerous armies of Germany' in the second. How will a historian-strategist fare when

¹ 'Unde Gothiam et Frisiam inhabitantes, impetus eorum pertinentes, in Angliam, ut moris est eorum, apud Gernemue [Yarmouth], tempore allecis capiendi, quo suas naves solebant onerare, non venerunt. Hinc erat quod allec eo anno in Angliā quasi pro nihilo prae abundantia habitum, sub quadragenario vel quinquagenario numero, licet optimum esset, pro uno argento in partibus a mari etiam longinquis vendebantur' (Matthew Paris: *Chronica Maiora*, sub anno A.D. 1238, in H. R. Luard's edition, vol. iii (London 1876, Longman, Trübner, Parkes, Macmillan, Black, & Thom), p. 488).

forces detailed for the defence betray their trust by delivering the attack? And what chance would Europe have of reviving and flourishing in an American city of refuge if the Power that had driven 'the remains of Civilised Society' out of the Old World and across the Atlantic was, not 'the Tartar hordes', but a sedentary people equipped with the most recently invented engines of a Western military technique?

Experience indicated that Gibbon's confidence in the inviolability of an American asylum for the Western Civilization would have been justified if—but only if—the aggressor's part had been played in reality by those arrested Nomad riders who had been cast for it in Gibbon's imagination. If the Continental Power that was under suspicion in A.D. 1952 of entertaining designs of world-wide conquest had been, once again, the Mongols, the peoples of the Western World would assuredly have had better reason this time for counting on the survival of their own distinctive culture than they had had in A.D. 1238, when they had been facing the prospect of a Mongol occupation of the West European peninsula of Asia without having any reassuring Transatlantic asylum at their backs. In A.D. 1952 they could have taken comfort in reminding themselves that in A.D. 1281 the forces of a Mongol Empire, which at that date had been mistress of the Continent from the shores of the Pacific Ocean to the shores of the Persian Gulf and the Baltic Sea, had been thrown back ignominiously from the beaches of Japan;¹ for a cavalry Power which had proved impotent to conquer a cluster of small islands separated from the Continent by only a hundred miles of sea at the nearest point would have had no prospect, if she had occupied the European coastline of the Continent that the Germans held in June 1940, of being able to conquer the great island of North America on the farther side of a nearly two-thousand-miles-broad Atlantic Ocean, or even the sister island of South America, which was divided by not less than sixteen hundred miles of sea from the Continent at the Straits of Dakar, where the westward bulge of Africa approached closest to the eastward bulge of Brazil. Indeed, the fiasco of Qubilay Khan's attempt on Japan suggests that even the twenty-miles-wide Straits of Dover, which had foiled Napoleon and foiled Hitler when the local Continental war-lord of the day had had the whole of Europe under his command, might have proved impassable for Qubilay Khan in spite of his commanding the Asiatic mass as well as the European extremity of the Continent. But the historic immunity of the isles from conquest by Continental war-lords had been due to the comparative innocuousness of even a sedentary community's most formidable weapons of offence until a hundred years and more after the date at which Gibbon had been writing; and no one who had lived through the war of A.D. 1939-45 could be blind to the truth that, since then, times had changed. The weapons with which Hitler had come within an ace of conquering Britain, and with which the combined forces of the United States and the British Commonwealth had succeeded thereafter in conquering Hitler's vaunted *Festung Europa*, were indications that in a future world war the conquest of North America might not be beyond the reach of a Power controlling the aggregate resources of the Old World

¹ See IV. iv. 93.

and capable of forging this incomparably vast store of war potential into unprecedentedly potent weapons through a mastery of an ever improving Western technology.

The significance of the Western World's progress in military technology is examined by Gibbon in the paragraph that follows next.

'Cold, poverty, and a life of danger and fatigue fortify the strength and courage of Barbarians. In every age they have oppressed the polite and peaceful nations of China, India, and Persia, who neglected, and still neglect, to counterbalance these natural powers by the resources of military art. The warlike states of Antiquity, Greece, Macedonia, and Rome, educated a race of soldiers; exercised their bodies, disciplined their courage, multiplied their forces by regular evolutions, and converted the iron which they possessed into strong and serviceable weapons. But this superiority insensibly declined with their laws and manners: and the feeble policy of Constantine and his successors armed and instructed, for the ruin of the empire, the rude valour of the Barbarian mercenaries. The military art has been changed by the invention of gunpowder, which enables Man to command the two most powerful agents of Nature, air and fire. Mathematics, chymistry, mechanics, architecture have been applied to the service of war; and the adverse parties oppose to each other the most elaborate modes of attack and of defence. Historians may indignantly observe that the preparations of a siege would found and maintain a flourishing colony;¹ yet we cannot be displeased that the subversion of a city should be a work of cost and difficulty; or that an industrious people should be protected by those arts which survive and supply the decay of military virtue. Cannon and fortifications now form an impregnable barrier against the Tartar horse; and Europe is secure from any future irruption of Barbarians, since, before they can conquer, they must cease to be barbarous. Their gradual advances in the science of war would always be accompanied, as we may learn from the example of Russia, with a proportionable improvement in the arts of peace and civil policy; and they themselves must deserve a place among the polished nations whom they subdue.'

In this paragraph Gibbon first suggests a second reason why a latter-day Western Civilization is unlikely ever to succumb to a Nomad conqueror, and then goes on to make an anticipatory reply to our critique of the immediately preceding paragraph of his General Observations. Our Western Civilization can count on never being extinguished by an eruption of the Eurasian Nomads, not only because 'the Tartar horse' would be incapable of pursuing across the Atlantic the ten thousand vessels that would transport to the Americas the refugees from a conquered Europe, but also because these Nomad barbarians would not even be capable of conquering the European peninsula of the Continent

¹ [in the original, 9]. "On avoit fait venir [for the siege of Turin] 140 pièces de canon; et il est à remarquer que chaque gros canon monté revient à environ 2,000 écus: il y avoit 110,000 boulets; 106,000 cartouches d'une façon, et 300,000 d'une autre; 21,000 bombes; 27,700 grenades, 15,000 sacs à terre, 30,000 instruments pour le pionnage; 1,200,000 livres de poudre. Ajoutez à ces munitions le plomb, le fer, et le fer-blanc, les cordages, tout ce qui sert aux mineurs, le soufre, le salpêtre, les outils de toute espèce. Il est certain que les frais de tous ces préparatifs de destruction suffiroient pour fonder et pour faire fleurir la plus nombreuse colonie." — Voltaire, *Siècle de Louis XIV*, chap. xx, in his Works, tom. xi, p. 391.

against defenders armed with Modern Western weapons. After thus completing the otiose task of flogging a dead Tartar horse, Gibbon makes the admission that the Nomads are not the only potential barbarian invaders on a Western World's eastern horizon, and that, even if we may assume that the Nomads could never succeed either in launching an ocean-going navy or in assembling a siege train of heavy artillery, there might be sedentary barbarians capable of mastering, for the purpose of aggression against the West, all the latest devices of Western military technology that the Western peoples, on their side, would have at their own disposal for the purpose of self-defence. Gibbon avowedly has in mind the metamorphosis of Russia in and after the reign of Peter the Great; and his reading of this passage of Russian history emboldens his optimism to venture on the highest of all its flights. 'Europe is secure from any future irruption of Barbarians, since, before they can conquer, they must cease to be barbarous': *si monumentum requiris*, look at Russia and be of good cheer!

What would have been Gibbon's second thoughts about this most 'doubtful' and most 'fallacious' of all his speculative grounds for optimism if he could have lived to see this particular argument tested by the experience of another 170 years? The fallacy, of course, lies in failing to distinguish the intellectual culture that takes practical effect in Technology from the spiritual culture that takes effect in morals. The flaw in Gibbon's argument here is to be found in his equivocal phrase 'the arts of peace and civil policy'. If this phrase could reasonably be construed as meaning no more than civil as contrasted with military engineering, then the minor argument of this sentence could perhaps be salvaged at the cost of jettisoning the major argument of the whole passage. It might be true, at any rate in the peculiar circumstances of latter-day Western life, that Technology was indivisible. Military engineering might be incapable of ever rising very high if it were not based on a firm civil foundation. But this truth—if it were indeed the truth—about Technology had no bearing on any question of morals, since it was not true that morals and Technology were indivisible from one another. On the contrary, we have found reason to believe that they go their different ways—Technology being a cumulative and collective acquisition of Mankind's, whereas the battle between good and evil has to be fought over again in the soul of each child that is born into the World.¹

Gibbon's case for optimism in this context thus proves to be founded on nothing more substantial than the ambiguity of a 'portmanteau' phrase which, by verbally confounding with one another the two mutually independent movements of moral and material progress, serves to give the false impression that these actually run in double harness. This is never true even within the bosom of a single society, where there is a *nisus* towards a harmony between the different elements constituting what is, after all, a single culture-pattern. *A fortiori*, there is no reason to expect that the moral standards of a civilization will keep company with its technique when this is being radiated out into an alien social milieu; for our study of encounters between different societies has shown that—

¹ See III. iii. 154-74; VII. vii. 556 and 701-11; and pp. 697-704, above.

whether both parties are civilizations¹ or whether one party is a civilization in its universal state and the other party a barbarian war-band beyond the *limes*²—the invariable effect of any impact on an alien body social is to diffract the integral culture-ray of the impinging civilization into its constituent elements; and we have also observed that, whenever this process of cultural diffraction occurs, the technical and economic radiation of the impinging civilization is apt to travel faster and penetrate farther than its political and cultural radiation.

In ignoring these manifest lessons of History, Gibbon is practising on himself the same trick that a contemporary Russian courtier once practised on a German Empress of Russia whom Gibbon has delighted to honour under the pseudonym 'Semiramis'; for, if, as Gibbon's major argument requires, the phrase 'arts of peace and civil policy' is to be construed as meaning morals as well as Non-Military Technology, the answer to Gibbon is that, while Russia, from the time of Peter the Great onwards, did indeed make advances in Technology *accelerando*, her advances in public morals, in and after the reign of the Empress Catherine the Great, were no more substantial than 'Potemkin villages'. Since morals, and not Technology, must be taken to be the true criterion of any conquering Barbarians' title 'to deserve a place among the polished nations whom they subdue', Gibbon was adding insult to injury in advising conquered Estonians and Latvians to console themselves with the reflection that the Russians' proven ability to conquer these 'polished' Western nations with borrowed Western weapons was good evidence that their conquerors had become their peers in a 'politeness' which was the eighteenth-century Western equivalent of a twentieth-century Western 'civilization'.³

The last two paragraphs of Gibbon's General Observations may be quoted together, since they are open to a common criticism that has been anticipated in our critique of the paragraph immediately preceding them.

'Should these speculations be found doubtful or fallacious, there still remains a more humble source of comfort and hope. The discoveries of ancient and modern navigators, and the domestic history or tradition of the most enlightened nations, represent the *human savage* naked both in mind and body, and destitute of laws, of arts, of ideas, and almost of language.⁴ From this abject condition, perhaps the primitive and universal

¹ See IX. viii. *passim*.

² See VIII. viii. *passim*.

³ An older contemporary of the present writer's who was a scion of one of the families of the *ci-devant* Baltic German landed aristocracy had heard, as a child, his father tell a story that is historically significant just by reason of its triviality. Some time about three-quarters of the way through the nineteenth century of the Christian Era, this Baltic Baron was travelling out of an Orthodox Christian Great Russia into the Protestant Baltic provinces of the Russian Empire in the company of one or two native Russian nobles. At the provincial boundary they changed carriages (they were travelling by road), and, as they were climbing into the carriage that had been awaiting them, the coachman happened to take out his handkerchief and blow his nose. The boys, who were visiting the Baltic provinces for the first time, had been expecting surprises, but at this first exhibition of Baltic 'politeness' they were overwhelmed. 'Well,' they exclaimed to their Baltic host, 'What a country! Even a coachman here has a handkerchief! Why, this is Europe!'

⁴ [in the original, 10]. 'It would be an easy, though tedious, task to produce the authorities of poets, philosophers, and historians. I shall therefore content myself with appealing to the decisive and authentic testimony of Diodorus Siculus (tom. i, Book I, pp. 11, 12; Book III, p. 184, &c., ed. Wesseling). The Ichthyophagi, who in his time

state of Man, he has gradually arisen to command the animals, to fertilise the Earth, to traverse the Ocean, and to measure the Heavens. His progress in the improvement and exercise of his mental and corporeal faculties¹ has been irregular and various; infinitely slow in the beginning, and increasing by degrees with redoubled velocity: ages of laborious ascent have been followed by a moment of rapid downfall; and the several climates of the globe have felt the vicissitudes of light and darkness. Yet the experience of four thousand years should enlarge our hopes and diminish our apprehensions: we cannot determine to what height the Human Species may aspire in their advances towards perfection; but it may safely be presumed that no people, unless the face of Nature is changed, will relapse into their original barbarism. The improvements of Society may be viewed under a threefold aspect. 1. The poet or philosopher illustrates his age and country by the efforts of a *single* mind; but these superior powers of Reason or Fancy are rare and spontaneous productions; and the genius of Homer or Cicero or Newton would excite less admiration if they could be created by the will of a prince or the lessons of a preceptor. 2. The benefits of law and policy, of trade and manufactures, of arts and sciences, are more solid and permanent; and *many* individuals may be qualified, by education and discipline, to promote, in their respective stations, the interest of the community. But this general order is the effect of skill and labour; and the complex machinery may be decayed by time or injured by violence. 3. Fortunately for Mankind, the more useful, or, at least, more necessary, arts can be performed without superior talents or national subordination; without the powers of *one* or the union of *many*. Each village, each family, each individual must always possess both ability and inclination to perpetuate the use of fire² and of metals; the propagation and service of domestic animals; the methods of hunting and fishing; the rudiments of navigation; the imperfect cultivation of corn or other nutritive grain; and the simple practice of the mechanic trades. Private genius and public industry may be extirpated, but these hardy plants survive the tempest and strike an everlasting root into the most unfavourable soil. The splendid days of Augustus and Trajan were eclipsed by a cloud of ignorance; and the Barbarians subverted the laws and palaces of Rome. But the scythe, the invention or emblem of Saturn,³ still continued annually to mow the harvests of Italy; and the human feasts of the Laestrigons⁴ have never been renewed on the coast of Campania.

¹ Since the first discovery of the arts, war, commerce, and religious zeal have diffused, among the savages of the Old and New World, those inestimable gifts: they have been successively propagated; they can never

wandered along the shores of the Red Sea, can only be compared to the natives of New Holland (*Dampier's Voyages*, vol. i, pp. 464–69). Fancy, or perhaps Reason, may still suppose an extreme and absolute state of Nature far below the level of these savages, who had acquired some arts and instruments.

² [In the original, '1']. 'See the learned and rational work of the President Goguet, *De l'Origine des Loix, des Arts, et des Sciences*. He traces from facts or conjectures (tom. i, pp. 147–337, edit. 12mo.) the first and most difficult steps of human invention.'

³ [12]. 'It is certain, however strange, that many nations have been ignorant of the use of fire. Even the ingenious natives of Otaheite, who are destitute of metals, have not invented any earthen vessels capable of sustaining the action of fire and of communicating the heat to the liquids which they contain.'

⁴ [13]. 'Plutarch, *Quaestiones Romanae*, in tom. ii, p. 275. Macrobius, *Saturnalia*, Book I, ch. viii, p. 152, edit. London. The arrival of Saturn (or his religious worship) in a ship may indicate that the savage coast of Latium was first discovered and civilised by the Phoenicians.'

⁵ [14]. 'In the ninth and tenth books of the Odyssey, Homer has embellished the tales of fearful and credulous sailors who transformed the cannibals of Italy and Sicily into monstrous giants.'

be lost. We may therefore acquiesce in the pleasing conclusion that every age of the World has increased, and still increases, the real wealth, the happiness, the knowledge, and perhaps the virtue, of the Human Race.¹

In these concluding paragraphs Gibbon—prudently recollecting certain considerations that had emerged from a celebrated controversy between the respective champions of the Ancients and the Moderns²—is at pains to refrain from drawing too optimistic a conclusion from the cumulativeness and collectiveness of Mankind's progress in Technology. He readily admits that the wind of individual genius bloweth where it listeth;³ and he goes so far as to concede that the corporate culture-pattern of a civilization may be precarious. He is content to follow Turgot⁴ in making for Technology the relatively modest claim that the humbler skills providing an agrarian society's fundamental necessities of life 'can never be lost';⁵ and twentieth-century Western sociologists and economists would perhaps find little to quarrel with in this Gibbonian thesis. Yet a Western historian who had lived to see the moral collapse of the Western Civilization in the twentieth century would hesitate to follow Gibbon in assuming it to be self-evident that a recrudescence of cannibalism in the Western World was quite so unlikely as a discontinuance of agriculture there; and, in agreeing that 'the imperfect cultivation of corn or other nutritive grain and the simple practice of the mechanic trades' are 'hardy plants' which 'survive the tempest and strike an everlasting root into the most unfavourable soil', a twentieth-century Western Christian would certainly not 'acquiesce in the pleasing conclusion that every age of the World has increased, and still increases, . . . the happiness, . . . and perhaps the virtue', as well as 'the knowledge, . . . of the Human Race.' Indeed, on the morrow of a Second World War that had laid Europe and Eastern Asia in ruins, a Western historian writing in A.D. 1952 might also be inclined to dispute even the proposition that 'the real wealth' of Mankind was inevitably increased by the progress of a Technology that could be used just as effectively for destruction as for production.

Gibbon's unargued assumption that progress in Technology and pro-

¹ [15]. 'The merit of discovery has too often been stained with avarice, cruelty, and fanaticism; and the intercourse of nations has produced the communication of disease and prejudice. A singular exception is due to the virtue of our own times and country. The five great voyages, successively undertaken by the command of his present Majesty, were inspired by the pure and generous love of Science and of Mankind. The same prince, adapting his benefactions to the different stages of Society, has founded a school of painting in his capital, and has introduced into the islands of the South Sea the vegetables and animals most useful to human life.'

² See pp. 62-73, above.

³ John iii. 8.

⁴ 'Les arts mécaniques n'ont jamais souffert la même éclipse que les lettres et les sciences spéculatives.'—Turgot, A. R. J.: 'Plan du Second Discours sur l'Histoire Universelle dont l'Objet sera les Progrès de l'Esprit Humain,' in *Œuvres*, nouvelle édition, (Paris 1844, Guillaumin, 2 vols.), vol. ii, p. 666. Compare *eundem*, 'Second Discours sur les Avantages que l'Établissement du Christianisme a procurés au Genre Humain', delivered at the Sorbonne on the 11th September, 1750, *ibid.*, vol. ii, p. 608, cited already in this Study in III. iii. 159, n. 3.

⁵ Among the higher intellectual activities, the same claim is made for mathematics alone by Gibbon in another context: 'The mathematics are distinguished by a peculiar privilege, that, in the course of ages, they may always advance and can never recede' (*The History of the Decline and Fall of the Roman Empire*, chap. lii, quoted on p. 701, above).

gress in morals must run neck and neck, as a matter of course, had been so effectively refuted by the experience of 170 more years of Western history that it could not fail to be evident to a Western historian, taking an observation in A.D. 1952, that progress in Technology, so far from being a guarantee of progress in virtue and happiness, was a challenge to it. Each time that Man increased the potency of his material tools, he was increasing the gravity of the moral consequences of his acts and was thereby raising the minimum standard of the goodness required of him if his growing power was not to turn to his destruction; and, while it was true that, in so far as a human soul succeeded in meeting Technology's spiritual challenge, technological progress might be credited with having been at least the blind and unintentional stimulus of this spiritual achievement, it was also true, as we have observed, that each individual soul had to fight the same ever recurring spiritual battle for itself under a mounting pressure from a Technology whose collective and therefore cumulative progress was bearing ever harder on each individual human spirit. In the intolerably mechanized 'Brave New World' conjured into existence by the Western Civilization in its post-Modern Age it was hard indeed for any human soul to resist the temptation of becoming a fiend without succumbing to the opposite temptation of becoming a robot.¹ This was the Human Race's predicament as twentieth-century Western eyes saw it, and from this observation no facilely pleasing conclusion could be drawn.

¹ See IV. iv. 56-114, and Table I in vol. vi, p. 327, reprinted as Table I in vol. vii, p. 769.

² The only statement that could be made with assurance in A.D. 1952 regarding the phase in which the Western Society was living at that date was that, so far, it had not entered into a universal state; and, if it is legitimate to infer from the uniformity of the pattern of the disintegration-process that a broken-down civilization would be unlikely to arrive at a universal state without having previously passed through a Time of Troubles with the standard Time-span of some four centuries, it would seem to follow that, if the Western Civilization had broken down (which was still an open question), this catastrophe could not have overtaken it earlier—at the earliest—than about half-way through the sixteenth century.

³ The date of the outbreak of the Veneto-Genoese War of Chioggia, which was the counterpart, in the history of the Medieval Western city-state cosmos, of the Atheno-Peloponnesian War that broke out in 431 B.C. in the Hellenic World.

⁴ This date is an inference from the date of the establishment of an Indic universal state by Chandragupta Maurya in 322 B.C.

⁵ This is the date of the introduction of the Mahāyāna into Japan from Korea (see Murdoch, J.: *History of Japan*, vol. i (London 1910, Kegan Paul), p. 111). Literacy in the Sinic characters and classics is recorded to have been introduced into Japan from Korea as early as A.D. 404 (see *ibid.*, p. 44). If this record is correct, and if this cultural event, rather than the introduction of the Mahāyāna, were to be taken as marking the planting of an offshoot of the Far Eastern culture in Japan, then the growth-phase of Japanese history—running, as it then would run, to 781 years—would be the longest of any in our list except the Western Civilization's.

TIME-SPANS OF GROWTHS OF CIVILIZATIONS 759

⁶ The approximate date of the flood-tide of the influx of Aramaean and Chaldaean Nomad barbarians from the North Arabian Steppe into both Babylonia and Mesopotamia. The Babylonian Civilization was brought to ruin by the militarism to which the Assyrians succumbed as the price of their arduous victory over the Aramaean invaders (see II. ii. 133-5).

⁷ The date of the sack of Khānfū (see IV. iv. 87).

⁸ Following Spinden's chronology, which dates the end of 'the First Empire' of the Mayas *circa* A.D. 600 (see I. i. 125, nn. 3 and 4).

⁹ Following Spinden's and Gann's chronology (see I. i. 124, n. 2).

¹⁰ Following Thompson's chronology (see I. i. 125, n. 3).

¹¹ Following Thompson's chronology (see I. i. 124, n. 2).

¹² Following Spinden's chronology.

¹³ This date is an inference from the fact that the Aztecs were on the eve of establishing a universal state in Central America when the Spaniards arrived on the scene in A.D. 1519.

¹⁴ The approximate date of the death of Solomon (see IV. iv. 68).

¹⁵ The date of the Shi'i revolt against the Ottoman Power in Anatolia.

¹⁶ The date of the Ottoman conquest of the dominions of the Egyptian Mamlūks.

¹⁷ Following the standard Sinic chronology, which dates the overthrow of the Shang Power by Wu Wang in 1122 B.C.

¹⁸ The date of the conversion of Russia to Orthodox Christianity.

¹⁹ Following the chronology of the Bamboo Books, which dates the overthrow of the Shang Power by Wu Wang in 1050 B.C.

²⁰ Following Thompson's chronology, which dates the end of 'the First Empire' of the Mayas in the first half of the ninth century of the Christian Era (see I. i. 125, n. 3).

THE INSPIRATIONS OF HISTORIANS

A. THE HISTORIAN'S ANGLE OF VISION

WHY do people study History? Why, to put the question *ad hominem*, had the writer of the present work been studying History since he was a child and been spending thirty years on this book which he was now finishing? Is an historian born or made? Every historian will have his own answer to this question, because he will be speaking from his own experience. *Quot homines, tot sententiae*:¹ each must speak for himself. The present writer's personal answer was that an historian, like anyone else who has had the happiness of having an aim in life, has found his vocation in a call from God to 'feel after Him and find Him'.²

If this personal answer finds any favour with the reader, it may help us also to answer a second question that is implicit in the one from which we have started. In beginning by asking ourselves why we study History we have begged the question: What do we mean by History? And the writer, continuing to speak simply for himself from his personal experience, would reply that he meant by History a vision—dim and partial, yet (he believed) true to reality as far as it went³—of God revealing Himself in action to souls that were sincerely seeking Him. Since 'no man hath seen God at any time'⁴ and our clearest visions are but 'broken lights' of Him,⁵ there are as many angles of vision as there are vocations, and the historian's angle is only one among a number of diverse angles from which souls with diverse gifts and diverse experiences obtain diverse partial visions of God seen through diverse fractions of His 'inconceivably mighty works'.⁶ Besides the historian's angle there is the astronomer's, the physicist's, the mathematician's, the poet's, the mystic's, the prophet's, the priest's, the administrator's, the lawyer's,

¹ Terence: *Phormio*, Act II, scene iv, line 14 (= line 454 of the play).

² Acts xvii. 27.

³ Man's vision of God has been aptly compared by Edwyn Bevan to a dog's vision of his human master. In the dog's association with his master there are some fields of action in which the master's activity comes within the range of the dog's understanding, while there are other fields in which the dog does not and cannot comprehend what his master is about. What the dog does come to feel and know, even with his limited intelligence, if he is a good dog and his master a good master, is that he is in the service of a being who is immeasurably superior to the dog himself; and from this intuition the dog—mere dog though he is—draws an intellectual and a moral conclusion. His intellectual conclusion is that his master's unintelligible acts and orders are likely to be as wise as those which the dog can understand have always proved to be. The dog's moral conclusion is that it is his own duty to take this superior being's acts and orders on trust—always obeying the orders with alacrity and acquiescing in the acts with resignation.

The present writer cannot find in Edwyn Bevan's published works any passage setting out this simile. He may perhaps have had it direct from this Christian historian's own mouth in conversation.

⁴ John i. 18; 1 John iv. 12.

⁵ Tennyson: *In Memoriam*, Invocation, stanza 5, line 3.

⁶ 'Die unbegreiflich hohen Werke'—Goethe: *Faust*, I. 249, quoted in II. i. 276.

the soldier's, the sailor's, the fisherman's, the hunter's, the shepherd's, the husbandman's, the artisan's, the engineer's, the physician's—and this roll-call could be extended over many pages, since human vocations are as numerous and as various as the glimpse of God that each of them gives is narrow and feeble. Among these innumerable angles the historian's angle is only one; but, like the others, it makes a distinctive contribution of its own to Mankind's piecemeal vision of reality. History's contribution is to give us a vision of God's creative activity on the move in a frame which, in our human experience of it, displays six dimensions. The historical angle of vision shows us the physical cosmos moving centrifugally in a four-dimensional frame of Space-Time; it shows us Life on our own planet moving evolutionarily in a five-dimensional frame of Life-Time-Space; and it shows us human souls, raised to a sixth dimension by the gift of the Spirit, moving, through a fateful exercise of their spiritual freedom, either towards their Creator or away from Him.

B. THE ATTRACTIVENESS OF THE FACTS OF HISTORY

(I) RECEPTIVITY

IF we have been right in seeing in History a vision of God's creation on the move, from God its source towards God its goal,¹ we shall not be surprised to find, in the minds of creatures endowed with consciousness, an awareness of History being awakened by the mere experience of being alive; but, since we have observed that 'Time's 'ever rolling stream'² flows at a varying pace,³ and that the surface of its waters is sometimes calmer and sometimes rougher, we shall also not be surprised to find that, in human minds whose innate receptivity to the impress of History is presumably always much the same on the average, the actual strength of the impression varies in accordance with the patient's historical circumstances.

For example, we have noticed in an earlier context⁴ that the vividness of historical impressions is apt to be proportionate to their violence and their painfulness. In the Western World in the generation that was in its childhood at the time of the transition from a Modern to a post-Modern Age of Western history towards the end of the third quarter of the nineteenth century of the Christian Era, a child who had lived through the American Civil War in the territory of the Southern Confederacy would be likely to grow up more historical-minded than one who had lived through the same experience at the North, while for the same reason a French child who had lived through the Franco-Prussian War and the subsequent establishment and suppression of the Parisian Commune in A.D. 1870-1 would be likely to be more aware of History than any of this French child's Belgian, Swiss, or English contemporaries. Yet even the Englishman or New Englander of that generation, who had been lucky enough not to have been given the unsolicited and unpleasant grounding in History that had been inflicted by Fate upon his Parisian and South Carolinian class-mates, could not help becoming automatically aware of History in some degree, simply in virtue of having been born into a social milieu in which the process of Civilization happened at the time to be in full swing. Even in the pleasantly placid reach of the mighty river in which his lot had fallen to him, a thousand familiar experiences would be constantly making him aware of his goodly heritage.⁵ History would be impressed on his receptive mind by the war memorials and other monuments in public places;⁶ by the names of streets, piazzas, farmsteads, and fields; by the architecture of the old buildings that the child had found already in existence when he had first become conscious of the outer world and by the architecture of the new buildings

¹ 'Ilayhi marji'ukum jami'an' ('To Him return ye every one')—*Qur'ân*, x. 4.

² Watts, Isaac: 'Our God, our help in ages past', quoted in I. i. 459.

³ See XI. ix. 348-77.

⁴ In XII. xi. 421-3.

⁵ Psalm xvi. 6.

⁶ The present writer's debt to the Albert Memorial in Kensington Gardens, London, for having given him a visual education in History (though not in Beauty) is mentioned among his acknowledgements on p. 214, below.

that he had since seen rising alongside of the older buildings, or in their place;¹ by the changes in fashions of dress;² by political events such as general elections to representative parliamentary bodies, the inaugurations of presidents and the coronations of kings and queens; by regularly recurrent festivals and ceremonies such as, in London, the Trooping of the Colour and the Lord Mayor's Show; and by the liturgy performed in church.

The conservatism of the bodies ecclesiastical that had come to encase the surviving higher religions had made these churches into incomparably potent radiators of impressions of historic events and historic characters; for the problem—which all the missionary religions had had to face—of converting illiterate populations *en masse* had been solved by them through the device of telling their story, conveying its moral, and inculcating its doctrine, in visual form.³ Even in a mosque, in which the possibilities of an educational use of Visual Art were restricted by the Prophet Muhammad's faithfulness to the second of the Mosaic Com-

¹ The changes which the present writer had seen, since his childhood, in the architecture of Park Lane, London, had given him an education in current social history. In the eighteen-nineties, new palaces, built for South African millionaires, were thrusting their way in between the older palaces of the English nobility. Between the First and the Second World War, palaces of both kinds were being pulled down to make way for blocks of flats and for mammoth hotels.

² The present writer used to be told by his Mother that, as a child, he had once announced to her that he had discovered the difference between 'ladies' and 'women'. 'Ladies', he had explained, 'wear bonnets; women wear shawls'—and it was true that, in England in the eighteen-nineties, feminine headgear still displayed the sharp differentiation into two categories that had been characteristic of it since the dawn of Civilization. While a small minority was privileged to follow the vagaries of a fashion that was deliberately kept on the move in order to make profits for the producers and to advertise that their customers were rich enough not to have to wait to make a new purchase till their last purchase had worn out, a majority still draped their heads in the timeless scarf (*Turcicé* charshaf) that had been consecrated for Christian eyes through figuring in the conventional garb in which the Virgin Mary was portrayed in the traditional representations of her. Since then, the writer had lived long enough to see this differentiation between two categories of feminine headgear not only disappear in England but also first appear and then begin to disappear in Turkey.

At the time of his first visit to Turkey in A.D. 1921, all Turkish women of all classes were still wearing the timeless charshaf; at the time of his third visit in A.D. 1929, the situation in Turkey was what it had been in England in the eighteen-nineties: while Turkish 'women' were then still wearing scarves over their heads, Turkish 'ladies' were by this time already wearing hats. By the time, however, of the writer's fourth visit to Turkey in A.D. 1948, feminine costume was already reverting towards egalitarianism—though now not *alla Turca* but *alla Franca*—by conforming to a new rule of 'fashions for all', in place of the old rule of 'charshafs for all' which had still been in force only twenty-seven years back. On the morning of the 3rd November, 1948, the writer and his wife, on the summit of the *qal'eh* (the citadel) at Ankara, found themselves walking along the principal street just behind three women, parading in a row, who were inadvertently displaying a *tableau vivant* of the last quarter of a century of the history of female dress in their country. The two youngest of the three were dressed according to the standard ecumenical Western fashion of the year. If an old-fashioned *jinn* had picked either of them up, transported her on a carpet to London or New York, and deposited her on the pavement or the side-walk, she would have been indistinguishable from the other young women of her age walking along the Edgware Road. The third member of this Ankaran trio, who might have been the girls' mother, was wearing a quaint mixture between the current fashion and the timeless feminine costume which reminded the writer of the eclectic dress that he had seen men—not women—wearing in A.D. 1929 in Japan. On the steps of one of the houses that we passed in procession on the main street of the citadel at Ankara on the 3rd November 1948, there was sitting a grandmother wearing the traditional Turkish female dress complete—including conspicuous shalwar (trousers). As the two girls paraded past her, we saw her eye them with an air in which self-assurance and disapproval were struggling comically with admiration and misgiving.

³ See V. vi. 508–34.

mandments, the *qiblah*, towards which the lines of the architecture skillfully drew the worshipper's eye, pointed, through the eloquent symbolism of an impressively empty niche, not only inwards in the Space-dimension towards the Ka'bah at Mecca, but also backwards in the Time-dimension towards the Prophet of Allah who had been the human Founder of the Faith. In a Christian church—unless it were the tabernacle of a Protestant sect of Western Christians in which the Second Commandment was obeyed with an Islamic punctiliousness—the apostles, prophets, and martyrs cited collectively in the *Te Deum* could be seen portrayed individually with their traditional distinctive attributes—the cross, sword, wheel, or other means of death through which the martyr had attained his crown, or the evangelist's book and pen—and these pictures, bas-reliefs, or statues told the spectator, at a glance, what they stood for, while the meaning of the Mass sung in 'a dead language' was declared to the devout worshipper's eye by the church's counterpart of the mosque's *qiblah*, since, all the time, the tabernacle on the altar was speaking to the worshipper visually of Christ, His passion, His divinity and His incarnation.

It will be seen that, in the days when the surviving civilizations were all still living under the aegis of the surviving higher religions clad in their traditional forms, 'going to church' (or mosque or synagogue or Hindu or Buddhist temple) was an automatic education in History that was apt to carry the passive recipient of it far afield in Time as well as in Space; and this education was as effective as it was informal, since it reached broad strata of the population that had no chance of going to school, while it taught lessons that came nearer to the heart of its pupils' lives than any formal book-learning. Christ and His apostles, the saints and the martyrs, the patriarchs and the prophets, and the biblical vista of History from the Creation through the Fall and the Redemption to the Last Things, were in truth realities of far greater importance for Christian souls than the parochial secular histories and the national notables, military, civil, literary, and scientific, that were subsequently to be thrust down the throats of a *plebs Occidentalis nuper Christiana* by the well-meaning but myopic-eyed organizers of national systems of compulsory universal education in post-Modern Western states. To put the case, once again, *ad hominem*, the longer the writer of this Study lived, the more glad he was that he had been born early enough in the Western Civilization's day to have been taken to church as a child every Sunday as a matter of course and to have received his formal education at a school and a university in which the study of the Greek and Latin classics, by which the Medieval Western study of Scripture and Theology had been replaced as a result of a fifteenth-century Italian renaissance,¹ had not yet been ousted in its turn by a study of Western vernacular languages and literatures, Medieval and Modern Western history, and a latter-day Western physical science.²

This automatic stimulus from the social milieu in which a human being grows up, and in which he continues to live and work as an adult, is the earliest and most widely radiative of the inspirations of potential

¹ See X. ix. 68, n. 2.

² See X. ix. 63-70.

historians; but this primal inspiration, while indispensable, is at the same time insufficient, and this in two ways.

In the first place, even in the civilizations of the third generation, which had all enjoyed the advantage of having had churches for their chrysalises,¹ the informal education in History through an ecclesiastical medium had never penetrated Society to its depths, since, throughout the Age of the Civilizations up to date, the vast majority of the population of every society in process of civilization had consisted of a Primitive Peasantry that, in A.D. 1952, still accounted for about three-quarters of the living generation of Mankind, and, for the Peasantry since the dawn of Civilization, History, as they had experienced it so far, had been a tale that had signified nothing, in spite of being 'full of sound and fury'.² This Peasantry, which had been rounded up into the fold of the civilizations and which had been fleeced there to provide a surplus for a privileged minority, had remained much like its less unfortunate brethren still at large in surviving primitive societies that the civilizations had not yet managed to devour; and, in the Peasantry's consciousness, the Government that was always impinging on their life so disagreeably was not the historical pageant, moving along an irreversible course through Time, that it looked like to a cultivated minority which had been trained to learn by heart the names and dates of the kings of England, Judah, Israel, Assyria, Babylon, and Ur, or alternatively those of the pharaohs of Egypt and the emperors of China and Japan; Government for the Peasantry was just an everlasting inevitable affliction of the same timeless presentness as the wars in which Government abused its power and as the pestilences and the famines that Government was powerless to avert.

One passage of History in which the Peasantry might have felt some interest, had they been aware of it, was the prehistoric mutation through which Sub-Man had once become Man in a Yang-movement in the evolution of Life that was a more prominent historical landmark than the subsequent rise of the civilizations;³ but this historic event, which latter-day Western archaeologists, anthropologists, and psychologists had recently begun to bring to light, had faded, ages ago, out of the folk-memory of their contemporaries who in A.D. 1952 were still lying torpid in Primitive Man's Yin-state; and, for practical purposes, the primitive human substratum of the living civilizations was still thoroughly un-historical-minded. The movement in the fabric of Creation that set the tune to which the Primitive Peasantry danced was the cyclic rhythm of Physical Nature: the cycle of the seasons, which governed their food-supply; the cycle of Day and Night, which dictated to them their timetable of alternating labour and rest; and the cycle of Birth and Death, which determined the life-span of every human being in his generation. The festivals that had a meaning and a value for the Peasantry were not the Fourth of July, Dingaans' Day, Guy Fawkes' Day, Armistice Day, and such like; they were the unhistorical red-and-black-letter days of the annually recurrent agricultural year. In fact, for at least three-

³ See II. i. 192-5.

quarters of the men and women alive on Earth in A.D. 1952, History was virtually non-existent—not because this majority were less receptive to the educative influence of their social milieu than were the minority that were at this time in process of Civilization, but because the majority were then still living in a social milieu that spoke to them, not of History, but of Nature.

Even, however, for the minority whose social milieu did speak to them of History, this exposure to the radiation of an historical social environment was not enough in itself to inspire a child to become an historian. A passive receptivity without which he would never get under way would also never avail to waft him into port unless it inspired him to travel under his own steam by awakening his mind to an active curiosity. A light glider will answer more readily than a heavy aeroplane to the fits and starts and twists and turns of a fitful veering breeze, but, for this very reason, its pilot will remain at the mercy of a capricious atmosphere unless his craft is converted from a glider into an aeroplane by being fitted with an engine; for, until he commands a driving-power of his own, he will never be able to choose a course and hold to it.

(II) CURIOSITY

The potential historian's mind is like an aeroplane driven by jet-propulsion. After it has received its first impulse to study History by being made aware of History through the impress of an historic social environment, the mind obtains its next impulse through a mutation of receptivity into curiosity. This transition from a passive to an active mood inspires the apprentice in History to take the initiative, go into action, and set off on aerial voyages of discovery into unknown skies.

Without this creative stirring of curiosity, the most familiar, impressive, and numerous monuments of History will perform their eloquent dumb-show to no effect, because the eyes to which they will be addressing themselves will be eyes that see not.¹ This truth that a creative spark cannot be struck without a response as well as a challenge was borne in upon the Modern Western philosopher-pilgrim Volney when he visited the Islamic World in the years A.D. 1783–5.² Volney had been born and brought up on one of the fringes of the *Oikoumenê*, in Transalpine Western Europe, in a region which had been drawn into the current of the histories of the civilizations only as recently as the time of the Hannibalic War (*gerebatur* 218–201 B.C.),³ whereas the region that Volney was visiting had been a theatre of History for some three or four thousand years longer than Gaul, and was proportionately well stocked with those relics of the Past of which the France of Volney's day could show comparatively few. Yet, in the last quarter of the eighteenth century of the Christian Era, the living generation in the Middle East were squatting among the amazing ruins of extinct civilizations, piled stratum upon

³ See I. i. 40.

stratum, without being moved to inquire what these monuments were; when, how, or why they had been first erected and then overthrown or allowed to decay; or what light these historic tragedies might throw upon the meaning of Human Life.¹ The curiosity to ask these questions had been stirred, not on the spot, in the cradle of Civilization, where the stimulus was at its maximum, but in a corner of the Old World where the stimulus was relatively weak. Yet, in Western Europe in the Modern Age of Western history, the faint impress of History which this weak stimulus had made on receptive minds had aroused in them a curiosity that was keen enough to draw Volney from his native France to Egypt in A.D. 1783² and, in his wake, the goodly company of French *savants* who seized the opportunity offered to them in A.D. 1798 by Buonaparte of

¹ See Volney, C. F.: *Les Ruïnes, ou Méditation sur les Révolutions des Empires*, chaps. 1 and 2, in *Œuvres Complètes de Volney* (Paris 1876, Firmin-Didot), pp. 9-12.

The indifference to the monuments of a pre-Islamic past which the Muslim population of Egypt and Syria showed in the ninth decade of the eighteenth century of the Christian Era, at the time of Volney's visit to those countries, was not peculiar to that generation of Muslims and was not confined to the field of archaeology. It was one facet of a catholic indifference 'to anything that is not directly of moment for his life in This World or the next' which is enjoined upon every pious Muslim by the precepts of orthodox Islamic theology (see MacDonald, D. B.: *The Religious Attitude and Life in Islam* (Chicago 1909, University Press), p. 120). 'And this is not simply theological; it is in the very texture of the Muslim mind. We can say: "This is an interesting book"; in Arabic you cannot express that idea. . . . Even curiosity, in the highest and finest sense, we cannot render. . . . The free, self-determining, self-developing soul may not walk its own path, however innocently, but must fit itself to the scheme and pattern of schools' (*ibid.*, pp. 120-1).

MacDonald goes on to quote 'Odysseus' [Sir C. Eliot]: *Turkey in Europe* (London 1900, Edward Arnold), p. 98, as a witness that there is the same lacuna in the Turkish vocabulary as there is in the Arabic. 'The Turkish language, copious as it is, contains no equivalent for "interesting". . . . The ordinary Turk does not take an interest in anything. . . . A natural want of curiosity, and a conviction that their own religion contains all that Man knows or needs to know, keep the provincial population in a state of ignorance which seems incredible and fantastic.' As far as Turkey, at least, was concerned, an intellectual indictment which had perhaps still been warranted by the facts as they had been in A.D. 1900 had become an anachronism by A.D. 1948 as a result of the Westernizing revolution through which Turkey had put herself in the meanwhile (see p. 10, n. 2, below).

² Volney has informed his readers—in prose in the preface to his *Voyage en Syrie et en Égypte* and in poetry in *Les Ruïnes*—of the considerations which led him to choose Asia—and, in particular, Syria and Egypt—in preference to America or Europe as the theatre for a bout of foreign travel on which he had decided to spend a legacy.

'C'est en ces contrées, me dis-je, que sont nées la plupart des opinions qui nous gouvernent; c'est de là que sont sorties ces idées religieuses qui ont influé si puissamment sur notre morale publique et particulière, sur nos lois, sur tout notre état social. Il est donc intéressant de connaître les lieux où ces idées prirent naissance, les usages et les mœurs dont elles se composèrent, l'esprit et le caractère des nations qui les ont consacrées. Il est intéressant d'examiner jusqu'à quel point cet esprit, ces mœurs, ces usages, se sont altérés ou conservés; de rechercher quelles ont pu être les influences du climat, les effets du gouvernement, les causes des habitudes; en un mot, de juger, par l'état présent, quel fut l'état des temps passés.'—Volney, C. F.: *Voyage en Syrie et en Égypte pendant les Années 1783, 1784 et 1785*, preface.

'Ahl si tu lis dans mon cœur, tu sais combien il désire la vérité, tu sais qu'il la recherche avec passion. Et n'est ce pas à sa poursuite que tu me vois en ces lieux écartés? . . . J'ai dit: . . . "J'irai dans la solitude vivre parmi les ruïnes; j'interrogerai les monuments anciens sur la sagesse des temps passés; j'évoquerai du sein des tombeaux l'esprit qui jadis, dans l'Asie, fit la splendeur des états et la gloire des peuples. Je demanderai à la cendre des législateurs par quels mobiles s'élèvent et s'abaissent les empires; de quelles causes naissent la prospérité et les malheurs des nations; sur quels principes enfin doivent s'établir la paix des sociétés et le bonheur des hommes."'—Volney, *Les Ruïnes*, in *Œuvres Complètes*, pp. 13-14.

Read also the invocation at the beginning of this work of Volney's, *ibid.*, p. 9. The double title of the work—*Les Ruïnes, ou Méditation sur les Révolutions des Empires*—tells, in itself, the tale of the author's successive passages, in his intellectual voyage of exploration, from receptivity to curiosity and from curiosity to investigation.

accompanying his expeditionary force. Unlike these intrepid men of science, neither Napoleon himself nor his officers and men were drawn to Egypt primarily by History's call; the mainsprings of their action were the barbarian's restlessness and ambition; yet Napoleon knew that he was striking a note to which even the uneducated rank-and-file of an eighteenth-century Western army would respond when he reminded them, before going into action on the decisive battlefield of Imbābah,¹ that forty centuries of History were looking down on them² from the Pyramids which their audacious march on Cairo had now brought within their view. We may be sure that Murād Bey, the commander of the opposing Mamlūk force, never thought of wasting his breath by addressing any similar exhortation to his own incurious comrades.

The French *savants* who visited Egypt in Napoleon's train distinguished themselves by finding a new dimension of History for a Modern Western Society's insatiable curiosity to conquer. This curiosity's first objective, at the dawn of the Modern Age, had been the classical languages and literatures of an Hellenic Civilization to which the Western Civilization was affiliated;³ and by A.D. 1798 it had followed up this feat of recovering possession of its own cultural heritage by taking possession of the cultural heritages of its contemporaries. After remastering their own Greek and Latin classics, Western scholars had proceeded to master the Islamic Society's Arabic and Persian classics, the Far Eastern Society's Sinic classics, and the Hindu Society's Sanskrit classics; and, not content with mastering the Hebrew original of the scriptures which a Christian Church shared with a Jewish diaspora, Western scholarship had also mastered by this time the Iranian language of the Zoroastrian scriptures of a Parsee diaspora which, like Jewry, was a fossil of an extinct Syriac Society that had been the Hellenic Society's sister. After having thus gone far towards appropriating all the treasures of the Past that had been preserved in the cultural heritages of the surviving civilizations, Western scholarship now went on to disinter other treasures that had been lying buried underground, wrapped in the napkin of oblivion,⁴ for hundreds and even thousands of years.

This was a much more formidable intellectual enterprise, for here the chain of tradition had long since been broken, and there were therefore no living interpreters to induct Western scholar-catechumens into these mysteries. By their own unaided efforts they had to decipher forgotten scripts and discover the structure, vocabulary and meaning of dead languages which were dead in the exact sense of being no longer in living use for any purpose whatsoever, in contrast to such so-called 'dead languages' as Latin or Sanskrit, which had merely passed out of current vernacular employment without ever having ceased to be spoken in liturgies and read in classical works of literature. The disinterment of the Egyptian Civilization by the enterprise of Western scholars in and after A.D. 1798 was thus a more remarkable achievement of Modern Western historical curiosity than the Italian renaissance of Latin and

¹ See IV. iv. 459-60.

² 'Soldats, quarante siècles vous regardent.'

³ This Late Medieval Italian renaissance of Hellenic letters has been discussed in X. ix. 62-73.

⁴ Luke xix. 20.

Greek letters in the fourteenth and fifteenth centuries of the Christian Era; and by the present writer's day no fewer than eleven once dead civilizations—the Egyptian, the Babylonian, the Sumerian, the Minoan, and the Hittite, together with the Indus Culture and the Shang Culture, in the Old World, and the Mayan, Yucatec, Mexican, and Andean civilizations in the New World—had thus been brought to life again in Western minds whose curiosity had led them to make these arduous voyages of intellectual exploration. The present writer's own lifetime (*vivebat* A.D. 1889–) had already, by the year A.D. 1952, seen the discovery of the most recently discovered four out of the eleven—namely the Shang Culture, the Indus Culture, and the Hittite and Minoan civilizations—and it had also seen vast progress made in the increase of Western knowledge and understanding of the rest.

Nor was this either the limit or the summit of these Western intellectual pioneers' achievement. Their *chef-d'œuvre* had been to infect with their own curiosity those non-Western peoples who, only a century and a half back, in Volney's and Napoleon's day, had been living and working under the shadow of the visible monuments of the Past without being moved by them.¹ In A.D. 1952, Japanese, Chinese, Indian, Egyptian, and Turkish philologists, historians and archaeologists² were labouring side

¹ 'Je pris l'hospitalité chez de pauvres paysans arabes, qui ont établi leurs chaumières sur le parvis même du temple [dédié au soleil à Palmyre] . . . Ah! comment s'est éclipsée tant de gloire? Comment se sont anéantis tant de travaux?'—Volney: *Les Ruines*, chaps. 1 and 2.

² In Turkish minds the present writer had seen, at first hand, this mental revolution in their attitude towards Turkey's pre-Turkish and pre-Islamic past accomplished since his first visit to the country in A.D. 1921.

In A.D. 1921, when the Ottoman Turkish people was engaged in a life-and-death struggle to retain possession of its homeland in Anatolia, the local monuments of a pre-Turkish and pre-Islamic past were still regarded by all but a tiny sophisticated minority as so many *pièces justificatives* which the Turks' Orthodox Christian *ra'iyeh* and their Frankish patrons could and would place on exhibition in support of their contention that the Turks were recent interlopers who had never acquired a prescriptive right to the territories on which they had squatted, and who therefore ought to be evicted in order to reinstate lawful proprietors who had been ousted by the Turkish intruders without ever having lost their title. Even in April 1923, when the writer paid his first visit to Ankara, this attitude still prevailed, though by that date the Turks had already succeeded in saving themselves by their own exertions. The Greek invaders' attempt to reach Ankara had been foiled; the fortunes of war had been dramatically reversed by a débâcle of the Greek army in Anatolia; and fresh negotiations for a peace-settlement between Turkey and the West European Powers were being conducted—this time on a footing of equality—at Lausanne. Yet in April 1923 the impression made on the writer by the spectacle of the temple of Augustus—occupied by a garden, annexed to a mosque, and crowned with storks' nests—was the same as that made on Volney 138 years earlier by the spectacle of the ruins of the temple of the Sun at Palmyra.

When the writer paid his next visit to Ankara in the summer of 1929, some six years after the Peace Treaty of Lausanne had been duly signed on the 24th July, 1923, he found the temple of Augustus cleared of its incrustations, converted into a museum, and filled with Hittite monuments collected from all parts of the country. By this time the Turks had begun to acquire confidence in their own future, and President Mustafa Kemal Atatürk had launched a counter-offensive on the battlefield of political archaeology by ruling that the Hittites had been proto-Turks. This ruling may not have been good history, but it was a good thing for History nevertheless, since its practical corollary was the revolutionary idea that Hittite monuments were Turkish national assets which it was the Turkish people's patriotic duty to preserve.

By the time of the writer's fourth visit to Turkey in the autumn of 1948 the change of attitude was complete. A public directorate of museums in the capital was matched by a local museum in every seat of a provincial administration, and this Turkish public archaeological service was working enthusiastically—undaunted by the inadequacy of its means for coping with the immensity of its task—to preserve and study all monuments

by side with the Western pioneers in intellectual fields that were 'white already to harvest';¹ and the progressive achievements of an intellectual pursuit that was exacting an ever increasing degree of specialization from scholars who set themselves to acquire its technique was at the same time arousing an ever increasing interest in an ever widening circle of laymen.

The popularity of Archaeology in the writer's day was attested by the alacrity with which the weekly illustrated papers and magazines found space for publishing pictures of archaeological excavations and finds. The discovery, on and after the 4th November, 1922, of the tomb of the Pharaoh Tutankhamen (*imperabat circa* 1362-1352 B.C.) created almost as great a furore in England as the birth of a polar bear cub in the Zoological Gardens in Regent's Park in A.D. 1950. The publication, in and after A.D. 1924, of the earlier volumes of *The Cambridge Ancient History*, dealing with once forgotten chapters of history which the archaeologists had recently brought to light, likewise caught the imagination of a cultivated lay public; and the contemporary interest in the history and literature of the Hellenic Civilization did not appear to have been diminished either in volume or in intensity as a result of the change in its character resulting from the breaking, in the writer's lifetime, of the virtual monopoly which, in England for some four hundred years past, the Greek and Latin Classics had shared with Mathematics alone in furnishing the staple pabulum of formal higher education. In a generation in which Hellenic studies were being pushed out of the centre into a corner of the field of education in the formal sense of the word, the absolute number of boys and girls learning Latin and Greek in at least this one Western country was apparently rising—and this without a catastrophic decline in the relative number—as a result of the great increase in the number of the recipients of a secondary education in some intellectual discipline or other,² while the growth of a popular interest in the life and letters of the Hellenic World among a wider public which had not mastered the Greek and Latin Classics in the original languages was attested by the

of the Past in every stratum without discrimination. At Ankara on the 3rd November, 1948, the writer and his wife met a pair of young Turkish archaeologists—man and wife—who had just found a trove of business archives accumulated, in the second millennium B.C., by a colony of Assyrian business men in their suburb outside the proto-Hittite city of Kanesh (on the 9th November, 1948, we visited this site, now known as Kanlı Saka, near Qaysari). At Bursa on the 21st November, 1948, the writer was asked to give a lecture on the history in the local secondary school to give a lecture at the Club on the history and pre-Islamic history of the region to a group of Bursans with antiquarian interests. The lecturer found an audience of several hundred people waiting for him, though the lecture had been arranged at not more than eight hours' notice, and, in conversation after the lecture was over, several of those present asked him to give them references to editions of the Greek texts of the works of Dio of Prusa and Arrian of Nicomedia with French or English translations in parallel columns, with the intention of acquainting themselves at first hand with the literary remains of a citizen of Bursa and a citizen of Ismid who were such eminent figures in the past history of this section of the country. This experience at Bursa made it clear to the writer that the Turkish people's change of attitude towards History was now an accomplished fact.

¹ John iv. 35. Cp. Matt. ix. 37-38; Luke x. 2.

² The vicissitudes of Greek and Latin studies in schools in England were indicated by the figures, given in the annual reports of H.B.M. Ministry of Education (published by H.B.M. Stationery Office) showing the numbers of those taking the School Certificate and the Higher Certificate in the various subjects. The following selection—which Mr. F. J. Kinchin Smith of the University of London Institute of Education had kindly

mounting sales of an increasing number of translations attaining ever higher levels of literary excellence. The distinguishing feature of these latter-day translations—and this was no doubt what commended them to their readers—was their success in making the Greek and Latin originals come alive in the vernacular. Instead of deliberately putting distance between the Classics and their readers by rendering the Classics into a 'translationese' unknown to real life, they exerted themselves to bring home to their readers the 'philosophical contemporaneity' and 'philosophical equivalence'¹ of the Hellenic and the Western Civilization by reproducing the originals in the living language of the corresponding literary genres of the day.

This Faustian insatiability of inquiring Western minds had come to be a theme of Western poetry. The impetus of a curiosity that had pressed on from an exploration of a physical ocean in the fifteenth century of the Christian Era to the sounding of the psychic abyss of the Subconscious in the twentieth century is deftly conveyed by Martyn Skinner in his *Letters to Malaya*.² Yet this cumulative collective achievement of curiosity, impressive though it be, is not the heart of a passion and a drama that can have no other theatre than a soul; and this individual experience had found its immortal expression in the English language in Keats' sonnet *On First Looking into Chapman's Homer*.

Then felt I like some watcher of the skies
When a new planet swims into his ken,
Or like stout Cortez when, with eagle eyes,
He stared at the Pacific, and all his men
Look'd at each other with a wild surmise,
Silent, upon a peak in Darien.

In the present writer's mind, the heroic exemplar of an invincible curiosity's response to the challenge of heart-breaking circumstances had always been Heinrich Schliemann (*vivebat* A.D. 1822–90), ever since a memorable day at Winchester when the writer as a boy had listened spell-bound to his master M. J. Rendall retailing, with zest, the salient episodes of this romantic life in a parenthesis during a session officially allocated to the construing of the *Iliad*.

'If I begin this book with my autobiography [Schliemann himself has communicated to the writer—would give an idea of the tendency during the thirty years ending in A.D. 1949.

² Skinner, Martyn: *Letters to Malaya III and IV* (London 1943, Putnam), pp. 40–47, quoted in VII. vii. 496–7.

written in the introduction to his *Ilios*],¹ it is not from any feeling of vanity, but from a desire to show how the work of my later life has been the natural consequence of the impressions I received in my earliest childhood, and that, so to say, the pickaxe and spade for the excavation of Troy and the royal tombs of Mycenae were both forged and sharpened in the little German village in which I passed eight years of my earliest childhood.²

In the village of Ankershagen, between Waren³ and Penzlin in the Duchy of Mecklenburg-Schwerin, of which Heinrich's father, Ernst Schliemann, was the Protestant pastor, and where Heinrich lived from his second to his fifteenth year (A.D. 1823-36), there were two elements in the social milieu—the local folk-lore and the pastor's personal interest in Hellenic history—that made their impress on Heinrich's receptive mind; and 'the persistence with which, throughout his life, he recalled the scenes of his youth and wrote to the people there—a family-feeling which no love of country had helped to nourish in this cosmopolitan—indicates the depth of those first experiences and discoveries'.⁴

'Just behind our garden was a pond called "das Silberschälchen", out of which a maiden was believed to rise each midnight, holding a silver bowl. There was also in the village a small hill surrounded by a ditch, probably a prehistoric burial-place (or so-called *Hünengrab*), in which, as the legend ran, a robber knight in times of old had buried his beloved child in a golden cradle. Vast treasures were also said to be buried close to the ruins of a round tower in the garden of the proprietor of the village. My faith in the existence of these treasures was so great that, whenever I heard my father complain of his poverty, I always expressed my astonishment that he did not dig up the silver bowl or the golden cradle, and so become rich.'⁵

The curiosity of the future excavator of the treasures buried in the Second City at Troy and in the royal tombs at Mycenae was diverted from Mecklenburg to the Mediterranean by his father's talk of the excavations at Pompeii and Herculaneum and his recital of the tale of the Trojan War; and here, twelve days before Heinrich's eighth birthday, the decisive impact was made by an engraving,⁶ representing the flight

¹ This account of Schliemann's career by the hero himself is as thrilling as it is brief (Schliemann takes no more than eighteen pages to bring himself from the cradle to the Troad in his forty-seventh year, A.D. 1868); but it was not written till Schliemann was nearly sixty years old, and it does not tally at all points with Schliemann's current records, which run to 150 manuscript volumes and 20,000 papers (see Ludwig, Emil: *Schliemann of Troy* (London 1931, Putnam), p. 24) and which have also been used by Schliemann's biographer. In op. cit., p. 27 n., and pp. 47 and 52, Ludwig hints that the retrospective autobiography must be taken *cum grano salis* in the light of the contemporary documents. (One specimen of these (see Ludwig, op. cit., p. 48) is an autobiographical letter, written by Schliemann in his twenty-first year to his sisters, which would fill eight printed pages.) The ampler contemporary information which Ludwig has had at his command has not, however, led him to impugn the authority of any of the passages from Schliemann's *Ilios* which are quoted in this Study.

² Schliemann, H.: *Ilios* (London 1875, Murray), p. 1.

³ The Waren from whom this village had received its name were presumably representatives of a Teutonic-speaking North European barbarian *Waren* (or *Wari* *alias* Warni *alias* Varini—who in the post-Hellenic Völkerwanderung (*aestuabat* A.D. 375-675) had anticipated Heinrich Schliemann's nineteenth-century descent from the Baltic upon the Aegean (see Chadwick, H.M.: *The Origin of the English Nation* (Cambridge 1907, University Press), pp. 102-10).

⁴ Ludwig, E.: *Schliemann of Troy* (London 1931, Putnam), p. 135.

⁵ Schliemann, *ibid.*, pp. 1-2.

⁶ Reproduced by Emil Ludwig in his *Schliemann of Troy* (London 1931, Putnam), facing p. 106.

of Aeneas from the burning city of Ilium, in a *Universal History*¹ which was the father's present to his son on Christmas Day, 1829. The boy had long been grieved to hear from his father that Troy had vanished without leaving a trace, and this picture—depicting massive city-walls—was naïvely taken by little Heinrich as evidence that his father had, after all, happily been mistaken, since the author of the book must have seen Troy as it was here represented. When his father replied that the picture was merely a fanciful one, Heinrich drew from him the admission of his belief that Troy must, in fact, have had walls as massive as those which the imaginary picture displayed.

“Father”, retorted I, “If such walls once existed, they cannot possibly have been completely destroyed: vast ruins of them must still remain, but they are hidden away beneath the dust of ages.” He maintained the contrary, whilst I remained firm in my opinion, and at last we both agreed that I should one day excavate Troy. . . . Thanks to God, my firm belief in the existence of that Troy has never forsaken me amid all the vicissitudes of my eventful career; but it was not destined for me to realise, till in the autumn of my life . . . , our² sweet dreams of fifty years ago’.³

¹ Written by Dr. Georg Ludwig Jerrer, and published at Nuremberg in 1828. Some forty years after Schliemann's death, this volume was found among his books and papers in his house at Athens by his biographer (see Ludwig Jerrer, *Life of Troy* (London 1931, Putnam), p. 24).

² The second person in this ‘our’ is not Heinrich Schliemann's father, whose character and conduct were not such as to inspire in his son's heart an admiration or a love to match the stimulus that the father's archaeological interests gave to his son's intellect; the second person was Minna Meineke, a girl of Heinrich's own age who was the daughter of a neighbouring farmer, and the words omitted in the passage quoted above are ‘and then . . . far from her’.

Schliemann, like Dante, had projected his anima on to a feminine figure of flesh and blood. In 1829, just after he had found his aim in life, ‘Minna . . . showed me the greatest sympathy and entered into all my vast plans for the future. Thus a warm attachment sprang up between us, and in our childish sympathy we exchanged vows of eternal love’ (Schliemann, *ibid.*, p. 4). But, like Dante, Schliemann lost his love in the flesh to recapture her in the spirit by redirecting his tragically thwarted passion into a mighty piece of creative work on to which he projected her image.

Ἐργάσομαι μεγάλ' ἔργα δι' ἔργων σου πελάσαιμ' ἄν
ἂν δ' ἄρα λείψωμαι, μέλζον' ἔτ' ἐργάσομαι.

The mighty works are eventually accomplished; but who is this ‘thou’ for whose sake they are undertaken? Is it really the lost living woman, or is it the hero's own indomitable and inescapable anima (‘quam scilicet, ut fit, effugere haud potis est’) in search of an alternative object?

Heinrich Schliemann inherited the destiny of the Trojan hero who, in Jerrer's picture, was displayed in flight from the City of Destruction to a new world. He, too, had to lose his Creusa in order to be free to espouse his Lavinia in the fullness of time; and Heinrich Schliemann relived Aeneas' legendary experience in real life in seeing Minna Meineke slip three times from his clasp—the first two times as a vicarious punishment for his father's misdemeanours (see *ibid.*, pp. 5 and 6) and the third time by a cruel mistiming (pp. 11–12). His account of his unexpected meeting with Minna on Good Friday, 1836 (p. 6), is not unworthy to be compared with the fourteenth chapter of Dante's *La Vita Nuova*.

Ter conatus ibi collo dare braccia circum,
Ter frustra comprehensa manus effugit imago
Par levibus ventis volucrique simillima somno.

‘It had indeed happened to Minna and me as it often happens to us in our sleep, when we dream that we are pursuing somebody and can never catch him, because as often as we reach him he escapes us again. I thought I could never get over the misfortune of losing Minna as the partner of my life; but Time, which heals all wounds, at last healed mine, so that, although I remained for years mourning for her, I could at least continue my mercantile pursuits without further interruption’ (Schliemann, *ibid.*, p. 12).

³ Schliemann, *ibid.*, pp. 3 and 5.

These dreams, once formed, remained the constant inspiration of Heinrich Schliemann's life.

'As long as I live, I shall never forget the evening when a drunken miller came into the shop. . . . He was the son of a Protestant clergyman in Roebel, Mecklenburg, and had almost completed his studies at the gymnasium of Neu Ruppın when he was expelled on account of his bad conduct. . . . Dissatisfied with his lot, the young man gave himself up to drink, which, however, had not made him forget his Homer; for, on the evening that he entered the shop, he recited to us about a hundred lines of the poet, observing the rhythmic cadence of the verses. Although I did not understand a syllable, the melodious sound of the words made a deep impression upon me, and I wept bitter tears over my unhappy fate. Three times over did I get him to repeat to me those divine verses, rewarding his trouble with three glasses of whisky, which I bought with the few pence that made up my whole fortune. From that moment I never ceased to pray God that by His grace I might yet have the happiness of learning Greek.'¹

The shop was Theodore Hückstädt's grocer's shop at Fürstenberg, and the year—A.D. 1837—was the second year of Heinrich Schliemann's employment there and the sixteenth of his age. Some five years later, when he had already risen from being an assistant in a North German village grocer's shop to being a clerk in a Dutch financial house at Amsterdam, he once more proved his faithfulness to his dreams by paying a high price for another step towards making them come true.

'My annual salary amounted only to 800 francs (£32), half of which I spent on my studies; on the other half I lived—miserably enough, to be sure.'²

And the rest of the acts of Heinrich Schliemann, and all that he did between his arrival in Amsterdam in A.D. 1842 as a ship-wrecked cabin-boy and his winding up of his business in St. Petersburg in A.D. 1863 as a millionaire—how he made his fortune by importing indigo into Russia and by trading in gold dust in California (automatically becoming, in the process, a citizen of the United States), and how, in the meantime, he taught himself to read and write English, French, Dutch, Spanish, Italian, Portuguese, Russian, Swedish, Polish, Modern Greek, Ancient Greek, Latin, and Arabic—is it not written in the Trojan hero's autobiography and in the book of Emil Ludwig?³

'Heaven continued to bless all my mercantile undertakings in a wonderful manner, so that at the end of 1863 I found myself in possession of a fortune such as my ambition had never ventured to aspire to. But in the midst of the bustle of business I never forgot Troy, or the agreement I had made with my father and Minna in 1830 to excavate it. I loved money indeed, but solely as the means of realising this great idea of my life.'⁴

The idea was indeed realized beyond all expectation; for the hero, who had spent his fifteenth to his forty-second year (A.D. 1836-63) in

¹ Schliemann, *ibid.*, p. 7.

² *Ibid.*, p. 9.

⁴ Schliemann, *ibid.*, p. 17.

accumulating the means, spent his forty-seventh to his sixty-ninth year (A.D. 1868-90)¹ in disinterring from the ground, and retrieving from oblivion, not only Troy, but Ithaca, Mycenae, Orchomenos, and Tiryns as well. The first of these two chapters in the story of Heinrich Schliemann's life might have come straight out of Smiles' *Self-Help*, and the second straight out of *The Arabian Nights*; but, of the two, it is the first that is, not only the more illuminating, but also the more romantic.

The writer of this Study, who was born only twenty months before the date of Schliemann's death, was compensated for having thus missed the chance of meeting this hero of History alive by coming to know two younger contemporaries of his own who had been inspired by the same indomitable spirit of curiosity to win victories over hardly less fearful odds.

Professor H. W. Bailey (*natus* A.D. 1899), a philologist of world-wide renown who in A.D. 1952 was the Professor of Sanskrit in the University of Cambridge, had awoken to consciousness as a child on a farm in Western Australia; and it would be hard to think of a more unpromising environment than this for producing a *savant* in the field of Oriental languages. The virgin soil of a recently colonized *terra nullius* exhaled no folk-lore to play the part of those local legends that had put Heinrich Schliemann, in his Varangian village, on the track of buried treasure; but the local human environment in Western Australia in the first decade of the twentieth century of the Christian Era did provide Harold Walter Bailey with the equivalent of the *Universal History* that had given the decisive turn to Heinrich Schliemann's life when it had come into Schliemann's hands on Christmas Day, 1829. The books that descended from Heaven upon the boy on the West Australian farm were 'a set of seven volumes of an encyclopaedia (eagerly devoured) and four other volumes with lessons in French, Latin, German, Greek, Italian, and Spanish. Later came Arabic and Persian, out of which Persian took the lead (joined later to Sanskrit)'.²

This was the trove that set Bailey's curiosity on fire; and in A.D. 1943 the present writer induced the modest scholar to describe to him how his family used to watch him, with a benign but whimsical gaze, while, during the noonday rest from their common labours in the field, he would be conning his Avestan grammar in the shade of an Antipodean haystack. By the time when he was approaching the age to matriculate at a university, the young student of Oriental languages had become aware that he had reached the limit of what he could teach himself, unaided, out of the books on which he could lay hands. What was the next step? At the University of Western Australia at this date there was no

¹ In this symmetrically rhythmic life, the caesura between the strophe and the antistrophe was marked by a voyage round the World in A.D. 1864-5 and a study of Archaeology in Paris in and after A.D. 1866.

² Note communicated, on the 7th April, 1952, by Professor Bailey to the writer of this Study with his letter granting the writer's request for his permission to allow his intellectual history to be cited here. The writer is most grateful to Professor Bailey for his kind consent. 'I am most flattered', this eminent scholar modestly and humorously remarks, 'to find I have left at least a faint streak on the surface of this tossing world of Samsāra!'

provision for Oriental studies; for help in these, the would-be student would have to go on to Western Europe or to North America. So Bailey taught himself Latin and Greek; took these as his subjects at his own university; won a scholarship at the University of Western Australia to take him to the University of Oxford; and found at Oxford the help that he needed in order to complete his mastery of Oriental languages.

Yet even Cambridge, England, could not provide this Australian philologist with a chair specifically allocated to the Khotanese language, akin to Persian and to Sanskrit, which had been introduced into the Tarim Basin by the Sakas¹ and which, while H. W. Bailey was studying Avestan under his haystack in Western Australia, had been recovered from oblivion by the labours of a series of Western pioneers in the Tarim Basin, culminating in the Hungarian-British archaeologist-explorer Sir Aurel Stein's trove of religious and secular literature in known and still all but unknown languages, on which this path-finder had lighted in May 1907 in a Taoist shrine at Ch'ien Fo-tung ('the Caves of the Thousand Buddhas'), near Tun-huang in the Su-lo-ho Basin, 'a natural corridor' leading from North-Western China into Central Asia, at the Western terminus of the former *limes* of a Sinic universal state;² and Khotanese and Tokharian were the fields in which Bailey, in the next stage of his intellectual career, was to give the most impressive demonstrations of his prowess in advancing the frontiers of philological knowledge.³

Schliemann's and Bailey's experience of being kindled into an undying glow of curiosity by the casual impact of one or two books was shared by another contemporary and colleague of the writer's, F. C. Jones, who in A.D. 1952 was a lecturer in Modern History at the University of Bristol with a special commission in the field of Far Eastern studies. At the same university, some thirty years earlier, Jones, as an undergraduate, had happened, while exploring the stacks of the university library, to stumble upon a cache of old books concerning the Far East that had been bequeathed to the university by F. V. Dickins, an Englishman who had

'The priest summoned up courage that morning to open before me the rough door closing the entrance to the rock-carved recess where the great trove had lain hidden. . . . The sight disclosed in the dim light of the priest's little oil-lamp made my eyes open wide. Heaped up in layers, but without any order, there appeared a solid mass of manuscript bundles rising to ten feet from the floor and filling, as subsequent measurement showed, close on 500 cubic feet. Within the small room measuring about nine feet square there was left barely space for two people to stand on' (*ibid.*, pp. 203-4).

³ See, for example, Bailey, H. W.: 'Hvatanica', in the *Bulletin of the London School of Oriental Studies*, vol. viii, Part 4 (London 1937, Luzac), pp. 923-36; 'Ttagara', *ibid.*, pp. 883-921; *Zoroastrian Problems* (Oxford 1943, Clarendon Press); 'Recent work in "Tokharian"', in the Philological Society's *Transactions* (London 1947, David Nutt), pp. 126-53; *Khotanese Texts*, vol. i (Cambridge 1945, University Press); *Khotanese Buddhist Texts* (London 1951, Taylor's Foreign Press).

In his letter of the 7th April, 1952, to the writer of this Study, Professor Bailey tells him: 'Only this morning I sent off to Sven Hedin a volume explaining his documents in the Khotanese language of the Sakas (four years' work). The Cambridge University Press is at this moment printing vol. ii, and I still plan two or three more volumes of this material. Persian and Sanskrit have come together for me in Khotanese studies—the Iranian speech with the Buddhist culture. My "curiosity" is as great as ever for this Central Asian miscellany!'

served as a medical officer in China and Japan in A.D. 1866-70 and had eventually become the university's Reader in Japanese. The dust with which the youthful explorer found these books covered told him that he was the first member of his university ever to have taken any interest in them; but this hitherto neglected batch of books now had a decisive effect on one student's mental life. From that moment onwards, Jones persistently pursued Far Eastern studies as a personal interest in addition to his regular academic work. He continued this pursuit as a lecturer in history, first at Dalhousie and King's University at Halifax, Nova Scotia, and then at Harvard. After that, with the aid of the Rockefeller Foundation, he made his way to China and spent nearly two years there—from the autumn of A.D. 1935 to the summer of A.D. 1937—partly studying Chinese at the College of Chinese Studies in Peking and partly travelling about the country; and, though China was in turmoil at the time, he managed to make his way far and wide into the interior. At the end of the year 1937 he joined the staff of the Far Eastern department of the Royal Institute of International Affairs in London, and eventually returned from there to his *alma mater* at Bristol. The present writer, who, by A.D. 1952, had had the pleasure of knowing, and of working with, this devoted student of Far Eastern history for more than fourteen years, had never seen a sign that his friend's curiosity was abating. Throughout he had continued to show the same steadily burning zeal to widen and deepen his knowledge and understanding of his beloved subject.

An experience that had meant so much to F. C. Jones, H. W. Bailey, and Heinrich Schliemann had also come the way of the present writer.¹ He will never forget a memorable morning in one of the early months of the year A.D. 1898 when a row of four books in a uniform binding made its first appearance² on a bookshelf in the dining-room of his parents' house in London, No. 12 Upper Westbourne Terrace. The series was Fisher Unwin's *The Story of the Nations*, and the subjects of the four volumes were *Ancient Egypt*; *Assyria*; *Media, Babylon, and Persia*; and *The Saracens*.³ The writer, who on that day was either approaching the end of his ninth year or just entering on his tenth, had awoken to consciousness in the most favourable human environment imaginable for the making of an historian, since, in his Mother, he had had an historian to bring him up. In A.D. 1898 he could already remember his Mother's having written *True Stories from Scottish History*,⁴ and could recall the

¹ In the present Part of this Study the writer has drawn, among other sources, upon his personal experience—not, of course, in any delusory belief that this is particularly interesting or important in virtue of being his own, but because, in the nature of the case, it is the only first-hand information about the subject of this Part that has been at his disposal.

² The date is approximately fixed by the fact that the books had been given to the writer's Mother, because she was an historian, when her mother-in-law's personal possessions were being distributed among the members of the family; for the date of the writer's grandmother's death was the 19th December, 1897.

³ For the authorship and dates of publication of these four volumes, see the acknowledgements in the present volume, on p. 219.

⁴ Toynbee, Edith: *True Stories from Scottish History* (London N. D., Griffith Farren Browne). There is no imprint of the date; but, in the copy which the writer took down just now from the bookcase, given him by his Mother, which stands behind his shoulder in his study at No. 45 Pembroke Square, London, the book is dated by the inscription, in his Mother's handwriting: 'Arnold Joseph Toynbee, October 1896, with Mother's love'.

excitement of seeing the proofs of the illustrations arrive and of finally holding the first bound copy in his hands. His Mother had written the book in order to pay for keeping his nurse till he was five years old instead of four; and, though, when the additional year ran out, he had been desolated to see his nurse leave, he had quickly been reconciled to the change by the intimate companionship that his Mother had given him during the years that had followed. Night by night, while she was putting him to bed, she had told him, in brief instalments, the history of Britain from Caesar's landing to the Battle of Waterloo, and the child had been readily receptive to this gracious impact of the parochial history of the Western country in which he had happened to be born. Yet that morning in A.D. 1898 on which those mighty suns the Egyptian, Babylonian, and Syriac civilizations swam into his ken in all their overwhelming grandeur was the decisive moment in the intellectual experience of this young watcher of the skies of History; for the advent of these hitherto unknown heavenly bodies shook him out of the Yin-state of receptivity into a Yang-movement of curiosity which, happily for him, was still a flowing tide on the 15th September, 1952, more than fifty-four years later.

Omnes

Restinxit stellas, exortus ut aetherius sol.¹

The epiphany of those civilizations of the first and the second generation took the light out of such commonplace planets as the parochial histories of ephemeral nations spawned in a parvenu Western World. The shallow landlocked waters of Lake Tenochtitlan could no longer satisfy the soul of a seeker after new worlds when once he had stared at the Pacific.

The child flung himself upon the Ocean,² and from that time onwards its expanse continued to open out in front of him faster than his ship's prow could cleave the ever widening waters. His inquiries whether Mexico was part of the United States and whether the Persians were Muhammadans were referred by his Mother to his Father. At school his awakened curiosity led him to relive Herodotus's experience of breaking his way into the new world of the Achaemenian Empire, and to explore two marooned enclaves of Christendom, Georgia and Abyssinia. At the university it led him to break into the new world of the Far East, via the Great Eurasian Steppe, in the footsteps of his fellow Franks John of Piano Carpini, William of Rubruck, Marco Polo of Venice, and their living successors Sven Hedin the Swede and Aurel Stein the Hungarian,³ and to acquaint himself with the career of the renegade Ottoman

¹ Lucretius: *De Rerum Naturâ*, Book III, ll. 1043-4.

² In A.D. 1952 the writer's earliest surviving memory was a recollection of having taken and carried out, at the age of two, on the beach at Abersoch in Wales, a decision to run into the sea in order to find out what would happen. What did happen was that his nurse ran in after him, pulled him out, and, in the act, sprained her ankle. There was no benevolently officious nurse to pull him back from the intellectual plunge that he made, six years after that, into the ocean of History.

³ The writer could still recapture the excitement to which he had been moved at the time by a lantern-lecture that Sir Aurel Stein had given at Oxford, in the great hall of the Examination Schools, at some date while the writer was an undergraduate (*studia exercebat* A.D. 1907-11). The panoramas of huge snow-covered mountain ranges would

cul, Scanderbeg. As soon as he was quit of his final examinations, it led him to spend a year surveying the theatre of Hellenic history on foot, as a student of the British archaeological schools at Rome and Athens, and to make the discovery of a living Ottoman World which eventually found him a place in the Turkish section of the Foreign Office division of the British Delegation to the Peace Conference of Paris in A.D. 1919. Between the First and the Second World War it led him to widen his range by taking into his cognizance the general course of current international affairs, and to add a new dimension to this mental universe by transshipping, with C. G. Jung as his navigator-psychopompus, from a surface-craft to a submarine in order to sound the Psyche's subconscious abyss. After the Second World War the same still irresistibly beckoning curiosity led him into making an excursion on the economic plane into a science of business cycles which promised to throw light on the larger and more momentous subject of the relation between Law and Freedom in History; and on the 15th September, 1952, when he was midway through his sixty-fourth year, the peremptorily rising note in the roar of Time's winged chariot's¹ accelerating engine was urging him to press forward, *ἔς γόνυ χλωρόν*,² into new worlds which this curiosity had marked down long since for future conquest.

At that age he was being spurred on by the example of the historian-banker-statesman George Grote (*vivebat* A.D. 1794-1871), who, more than two years before he had returned to the printer, on the 23rd December, 1855,³ the last corrected proof-sheets of the twelfth and concluding volume of his history of Greece, had begun to knap off two sister works on the philosophies of Plato and Aristotle.⁴ The work on Plato had straightway been written and published in three volumes;⁵ and, 'no sooner had the *Plato* been completed, and the printing begun,⁶ than the author "set the loom" afresh for his *Aristotle*—scarcely permitting himself breath' before applying himself 'to the preparation of the third part of what he used to call "my trilogy."' Yet, notwithstanding the diligence of Grote's response to the challenge of Time's hurrying chariot's clatter, Death had overtaken him with his *Aristotle* still incomplete.

In taking to heart this example set by George Grote, the present writer was following in the footsteps of Lord Bryce (*vivebat* A.D. 1838-1922), who, whenever he was writing a book, used to have on his agenda not only the next book but also a perpetual next book but one. This permanent lure on the intellectual athlete's literary horizon was a projected

flash up in his visual memory, and he could recall how, when the lecturer had mentioned, in passing, that he had lost some toes there through frost-bite, the eager listener had recognized that he was in the presence of a discoverer who was indeed in earnest about his intellectual mission.

⁵ London 1865, John Murray. On the 23rd April, 1951, the present writer took down from the shelf in the Athenaeum Club in London the set of these volumes that had been given to the Club by their author, with an inscription in vol. i in George Grote's handwriting.

⁶ In September 1864.

⁷ Grote, Harriet, op. cit., p. 277.

work on the lives and time of the Roman Emperor Justinian I and his consort Theodora; and, though this most lovingly cherished of all the historian-jurist-statesman's literary projects eventually had the same fate as the historian-banker-statesman's work on Aristotle, this ever receding and never captured intellectual quarry performed for Bryce the invaluable service that 'the electric hare' performs for the greyhound on the racing track. It kept the runner's energies at full stretch; and his never flagging eagerness to catch his *Justinian* was, no doubt, not the least potent of the stimuli that prompted him to achieve the heroic feat of producing his *Modern Democracies* (*conscripsum* A.D. 1918-21)¹ after he had turned eighty.

¹ The present writer had the good fortune to become personally acquainted with Lord Bryce in his seventy-seventh year, when the writer, as a young man, had been commissioned to compile, under Lord Bryce's direction, a blue book on *The Treatment of the Armenians in the Ottoman Empire*, published as Miscellaneous No. 31 (1916) [Cmd. 8325] (London 1916, H.M. Stationery Office); and, thanks to the friendliness which Lord and Lady Bryce never ceased to show to people of younger generations, he had had the happiness thereafter of continuing to see something of the historian during the last eight years of his life.

At this age, Bryce still showed a youthfulness which showed itself physically in his persistence in going upstairs two stairs at each step. This apparently inexhaustible fount of physical energy was replenished (so it seemed to the writer) from spiritual sources, and one of these was an unfailing curiosity. *Γηράσκω δ' αἰεὶ πολλὰ διδασκόμενος* (Solon, fragment 17, in Bergkh-Hiller-Crusius's edition). At a time when Bryce was clearing his decks from war-work in order to go into action on *Modern Democracies*, the writer happened to mention in conversation with him that he knew G. D. H. Cole, who at that time was active in expounding the idea of Guild Socialism. Lord Bryce instantly began to ask the writer whether he could direct him to any literature that had been published on the subject, as he had already made a mental note that he must not fail to take account of Guild Socialism in his own forthcoming work. This was evidence indeed of Bryce's freshness of mind at the age of eighty. When, at this age, he was girding himself for the huge task of writing a comprehensive work on the political phenomena of the Modern Western World, he might have been expected to feel, not exhilaration, but repugnance, at the prospect of having to take account of yet another mushroom ideology; and an intellectual inhibition might well have been reinforced by a political prejudice, considering that Bryce himself was, not a socialist, but a life-long liberal. Yet his vaulting curiosity cleared both these psychic fences at one bound. On the 23rd April, 1951, the present writer's own curiosity moved him to take Bryce's *Modern Democracies* (London 1921, Macmillan, 2 vols.) down from the shelf in a library to look up 'Guild Socialism' in the index. Sure enough, it is described in vol. ii, on p. 645.

The writer never ceased to be struck by the contrast, in their respective responses to the challenge of chronological age, between Lord Bryce and another historian, James Leigh Strachan-Davidson, the Master of Balliol, who was Bryce's junior by five years (*vivebat* A.D. 1843-1916). In A.D. 1913-15, at meetings on academic business in the Master's study, the writer, scanning the books on his shelves, discovered, to his surprise and concern, that there had been hardly any fresh acquisitions since the early eighteenthies—hardly any, that is to say, since the historian had passed his fortieth year (see Mackail, J. W.: *James Leigh Strachan-Davidson* (Oxford 1925, Clarendon Press), p. 53). Down to about that date the principal English, American, French, and German publications in the fields of Hellenic history, Hellenic and Western philosophy, Western political economy, and contemporary Western *belles lettres* were well represented, but, after that, the flow of new acquisitions had suddenly ceased, and this could only mean that, in his early forties, the fire of this scholar's curiosity had gone out. The writer could never discover any outward event in this period of Strachan-Davidson's life that would account for this intellectual mishap, but a clue to the whole of the Master's intellectual history had come into his hands on the 22nd October, 1913; for that day had been the Master's seventieth birthday; the fellows of the College had given a dinner in the Master's honour that evening; and the keypoint in the speech in which the Senior Fellow had proposed his health had been the remarkable fact that the Master had never been away from the College for as long as twelve months running at any time since his first arrival there as an undergraduate at the age of eighteen. As the writer listened, he was struck with dismay; for he himself, being at that time in his twenty-fifth year, had just returned to the College after a sixteen months' absence and had been inducted as a fellow on terms which

Encouraged and admonished by the examples of Bryce and Grote, the present writer took his arrival in December 1950 at the threshold of the twelfth part out of the planned thirteen parts of this Study as a signal for him to cast his mind forward, in anticipation of the now imminent date at which this current work would be over, to plan the writing of a *Religio Historici* and the completion of a history of the Hellenic World—begun in A.D. 1914 on an invitation from the editors of *The Home University Library*—of which he had written the first forty-two sheets¹ when his progress had been interrupted by the outbreak of the First World War.

In A.D. 1952 the present writer's curiosity was also agog to finish learning the Arabic and Ottoman Turkish languages and to begin learning Classical New Persian. He had found himself compelled to suspend work on acquiring these three languages when, after having started in A.D. 1924 to produce an annual *Survey of International Affairs* under the auspices of Chatham House, he had started in A.D. 1927 to make systematic notes for the present Study, which he began to write, *pari passu* with the *Survey*, in A.D. 1930. Ever since the time, towards the close of his five years at Winchester (A.D. 1902–7), when he had gained a sufficient mastery over the Greek and Latin languages to make him at home in the Hellenic classics, it had been his ambition to make himself equally at home in the Islamic classics, and he had taken the first step towards this end between A.D. 1915 and A.D. 1924 at the London School of Oriental Studies—starting to learn there the rudiments of Turkish during the First World War from 'Ali Rizā Bey,² and the rudiments of

were tantamount to a life tenure so long as he did not marry, go bankrupt, or commit any other immoral act. That night he dreamed that the corresponding toast was being proposed in his own honour as a veteran fellow of the College on the 14th April, 1959, after another forty-five years, five months, and twenty-three days had passed as swiftly as he knew that they would pass for him if he were to adopt the Master's regimen. Next morning he woke up firmly resolved not to allow this doom to overtake him.

¹ As he wrote these words, he took these sheets out of a drawer in a bookcase, given him by his Mother, in his study at No. 45 Pembroke Square, Kensington, London.

² The experience of his date had been his horror at the events which he had been recording in the blue book on *The Treatment of the Armenians in the Ottoman Empire* that he had been compiling under the direction of Lord Bryce. How had any human beings come to perpetrate those inhuman acts? The 'Osmanlis, being human, must be men of like passions with his and his fellow-countrymen's English selves. What was the explanation of this appalling mystery? The first step towards arriving at it would be to understand the Turks, and the key to that would be to learn the Turkish language.

When the writer enrolled at the London School of Oriental Languages in A.D. 1916 in order to begin learning Turkish, the lecturer in Turkish, 'Ali Rizā Bey, demurred to being asked to take as a pupil a man who, as he saw it, had just shown himself, in a published work, to be an enemy of 'Ali Rizā Bey's country. When he submitted this objection to the Director of the School, Sir Denison Ross, the Director pointed out to him that, if his patriotism was founded—as it was—on a sincere belief in the sterling qualities of the Turkish national character, he was now being presented with an opportunity—which, as a patriot, he ought not to let slip—of making an English convert. The Turkish lecturer was convinced by the Director's shrewd argument, and happily he did not afterwards have to regret that he had taken Sir Denison Ross's advice; for the knowledge of the Turkish language—rudimentary though it still was—which the writer had acquired from 'Ali Rizā Bey by A.D. 1920 enabled the writer in A.D. 1921 to make an exposure of the treatment of the Turks in that year in the Ottoman territories then under Greek military occupation.

By that time the writer had made an empirical discovery of the truth that Human Nature is nowhere and never proof—not even in the communities that have travelled the

Arabic after the Peace Conference of A.D. 1919 from Professor Sir Thomas Arnold and Professor H. A. R. Gibb. By A.D. 1952 a craving that had been dammed back since A.D. 1924 had accumulated a powerful pressure of urgency. The writer was stung by shame whenever he recollected that his hero Heinrich Schliemann had taught himself no less than thirteen languages during the twenty-seven years (A.D. 1836-63) that he had had to spend on making his fortune; but he could then recruit his courage by recalling that his heroine Jane Ellen Harrison had taught herself both Persian and Russian after she had passed her sixty-fifth year; for this example carried with it the admonition 'Go and do thou likewise'.¹

In A.D. 1952 the writer's curiosity was also still being stimulated through still being tormented by longings to make his pilgrimage to historic points on the face of the *Oikoumenē* on which he had never yet set eyes or which had once tantalized him with a Pisgah sight. He had seen Assisi from Spello on the 30th October, 1911, without ever having succeeded in reaching Assisi at any time during the next forty years. He had been shunted in and out of Venice on the Orient Express three times without ever having come nearer to Saint Mark's than into the presence of the pair of Roman emperors in porphyry who stood clasped in a mutual embrace outside a door that was barred and bolted at 5.30 a.m. He had twice passed Qāramān by train without having had time, either on the 31st August, 1929, or on the 13th November, 1948, to break his journey in order to view the interior of those romantic city-walls and press on, beyond, across Cilicia Tracheia to Selefkēh. On the 14th September, 1929, he had gazed longingly up the River Kārūn into Persia while his ship bore him on inexorably, past the confluence of the Kārūn with the Shatt-al-'Arab, *en route* from Basrah to Karachi. On the Great Wall of China, at the Nankow Pass, he had had to turn back without being able to pursue the Wall on its snakelike westward course towards a terminus thirteen hundred miles and more away. And he had never yet come near to setting eyes on Trier, Ravenna, Monte Vulture,² Yannina, Rhodes, Diyārbekir, Qars, Ani, Van, Ispahan, Yazdikhvast, Persepolis, Shīrāz, Khotan, Turfan, the Najd, the Yaman, Abyssinia, Qayrawān, the High Atlas, Cholula, Mayaland,³ Easter Island, or the hyper-cyclopean masonry of the Andean highlands.

Whenever the writer was racked by this unfulfilled Herodotean

farthest along the road towards Civilization—against the temptation to commit inhuman atrocities. There will always and everywhere be a point at which the mounting pressure of this temptation will burst the precarious dam within which social habit imprisons the floodwaters of Original Sin. An education in the psychology of atrocities which the writer began as an eye-witness on the Qaramursal Peninsula in the Sea of Marmara in A.D. 1921 was completed when he came back to England to hear of what the English 'Black and Tans' had been doing meanwhile in Ireland.

By this time, 'Ali Rizā Bey and the writer had become fast friends; but it was not till long afterwards that the writer was told about 'Ali Rizā Bey's conversation with Sir Denison Ross in A.D. 1916.

² Climbed on the 7th October, 1953, while this page was in the press.

³ Thanks to a grant from the Rockefeller Foundation for travelling with an eye to producing a revised edition of the present work, the writer and his wife had now visited Cholula on the 20th April, 1953, and Palenque, Chichén Itzá, Uxmál, and Kabah between the 7th and the 14th May of the same year, and were planning to visit the Andean World in the autumn of A.D. 1956.

ambition to complete his oecumenical pilgrimage, he used to revive his drooping hopes by recalling an anecdote which he had once heard from the mouth of that triumphantly world-wide traveller Lord Bryce. After having explored half the surface of the globe in the course of a long life, Lord Bryce had felt one day a slight misgiving lest his advance in chronological age might hinder him from carrying out the rest of his peregrinational agenda; so he had decided, in consultation with Lady Bryce, that they would choose for the field of their next journey some region that would serve to test their physical stamina. Their choice had fallen upon Siberia; and, when they had ascertained that they could stand this physical ordeal without feeling any strain, they had been able to put their anxiety behind them and to proceed with their exploration of the remainder of the Inhabited World.¹ Lord Bryce's example became the more encouraging to the writer the nearer he approached to the end of *A Study of History*; and, midway through his sixty-fourth year, he was thanking God that a curiosity which had set sail fifty-four years ago had, so far, never found itself becalmed. Rather than be condemned to the Ancient Mariner's life-in-death, he would pray to be carried on by the divine wind of curiosity's unflagging inspiration at the risk of meeting *Kon-Tiki's* end among deadly breakers on a Raroia Reef² at the Ocean of History's unimaginable limit.

(III) THE WILL-O'-THE-WISP OF OMNISCIENCE

Without the inspiration of curiosity, no one can be an historian, since, without it, no one can break out of a Yin-state of infantine receptivity by setting the mind on the move and taking bearings in the Universe. No one can either become an historian till he has acquired curiosity or remain an historian if ever he loses it. Yet an inspiration which is indispensable is at the same time insufficient; for curiosity is a faculty which is valuable only as a driving force for generating higher activities. If it is allowed to spin round in a vacuum, turning nothing but its own wheels, it stultifies itself and also sterilizes the soul in which it has thus been allowed to run amok. Curiosity by itself is of no more avail than is receptivity by itself for bringing a budding mind to flower. The mind that is to blossom into an historian's mind must rise to a higher flight; and, if it allows its curiosity to set its spiritual ceiling for it, it will be guilty of a grave moral error that will prove also to have been a serious

¹ Looking up this episode, on the 23rd April, 1951, in H. A. L. Fisher's *James Bryce* (London 1927, Macmillan, 2 vols.), the writer found it duly recorded there in vol. ii, on pp. 104-6. On his retirement in A.D. 1913, when he had turned seventy-five, from being British Ambassador at Washington, Lord Bryce seized the opportunity of returning home to England via the Pacific, Japan, Manchuria, and Siberia; and, travelling via the Transsiberian Railway, he was unwilling to let slip the further opportunity of catching a glimpse of the Altai Mountains, as these lay not more than a mere four hundred miles or so off his course. Accordingly the Bryces detrained from the Transsiberian Express at Taiga, embarked on a river-boat at Tomsk, and proceeded by water down the Tom and up the Tobol via Novonikolayevsk (afterwards renamed Novosibirsk) and Barnaul to Biisk. Transferring here from boat to tarantas, they then experienced 'eight of the hardest days of travelling we have ever gone through'. Their reward was a sight of the Altai Range from the summit of the Semenski Pass on the 22nd August, 1913. The 'round-trip' had mounted up to some 1,200 miles before they re-entrained for Moscow.

² Read Thor Heyerdahl: *Kon-Tiki, Across the Pacific by Raft* (Chicago 1950, Rand McNally).

intellectual mistake; for, if curiosity is a Pegasus from which the historian must never dismount, this winged steed is also one which he must never allow himself to ride without a curb.

The scholar who permits his curiosity to run away with him is courting the danger of condemning his creativity to be blighted; and this was a danger to which Western scholars were peculiarly exposed by a Western educational tradition in which the goal of education that was set before the pupil's eyes by his masters was, not adult active life, but an examination. This institution, which had worked such havoc with Western intellects during the last eight centuries of Western history, had presumably been introduced by the Early Medieval fathers of the Western universities into the educational field from the theological; for the myth of a Last Judgement had been part of the Christian Church's heritage from the Osirian Church through the Zoroastrian,¹ and, while the Egyptian fathers of the worship of Osiris had conceived of the Last Judgement as an ethical test symbolized in a weighing of the departed soul's good and bad deeds against one another in the scales of Osiris' balances, a Christian Church which had taken on board a top-heavy freight of Hellenic philosophy² had overlaid an Osirian ethical questionnaire in which the query was 'Good or bad?' with an Aristotelian intellectual questionnaire in which the query was 'True or false?'

When this abomination of intellectualism, standing in the place where it ought not,³ had thus been given dominion over Western secular education as well as over Western Christian theology, the anxiety not to be found wrong by a human examiner on matters of mundane fact had come to weigh as heavily on the souls of apprentices in Western schools of higher education as if the penalty for being caught out in an intellectual mistake had been, not the mere refusal of a degree which was the severest censure that a university could inflict in reality, but the awful condemnation to eternal torment in Hell which, in Medieval and Early Modern Western Christian belief, was the inexorable retribution for the holding of unorthodox tenets in the sphere of theology.

In Western educational circles a fear of intellectual damnation that had thus originally been inspired by an analogy taken from current religious ideas had survived when, in a Late Modern chapter of Western history, the belief that eternal damnation after death was the penalty for theological error had gradually ceased to haunt Western minds and oppress Western spirits. As, in the course of this age, the quantity of mundane information at the disposal of Western examiners for use as ammunition in their intellectual warfare with Western examinees came to increase by geometrical progression, Western educational examinations came to be the nightmare that Western theological inquisitions had once been; and the worst of their effects was the posthumous one; for even an alumnus who had passed with honours all the ordeals that his *alma mater* had known how to inflict upon him was apt to emerge from his education haunted by an abiding subconscious fear of being weighed in an imaginary future examiner's

³ Dan. xi. 31 and xii. 11; Matt. xxiv. 15; Mark xiii. 14; Luke xxi. 20.

balances and found wanting,¹ and such victims of an intimidating Western examinational system of education would need the intervention of God's grace to save them from spending the rest of their lives, not in living and acting and making practical use of what they had learned, but in still anxiously preparing for an unseen final examination lying in wait to confound their disembodied souls after they had carried their life-long accumulation of learning with them into the grave.

This pursuit of the will-o'-the-wisp of omniscience convicts its addicts of a moral error in two degrees. In ignoring the truth that the only legitimate purpose of learning is to make something of it, within the learner's lifetime, that can become part of Mankind's common stock of useful knowledge, the scholar-sinner betrays a lack of sociality; in ignoring the further truth—which is just as true on the intellectual plane of human activity as on any other—that completeness and perfection are unattainable by human souls in This World, he betrays a lack of humility; and the second of these two sins, which is the graver, is also the more insidious; for the scholar's intellectual hybris masquerades as humility itself. A scholar is proving himself guilty of a subconscious hypocrisy to which he is wilfully shutting his mind's eye when he pleads guilty of ignorance and protests that his conscience will not permit him to publish, write, or even say anything on his subject until he has mastered the last jot and tittle of the information available up to date. This profession of humility is a camouflage for the three deadly sins of Satanic pride, undutiful negligence, and culpable sloth.

The professedly humble-minded scholar stands convicted of pride because the intellectual standard which he is confessing his failure to attain so far is the omniscience of Almighty God and not the partial and relative knowledge which is the most that can actually be compassed in human life by any mind which, like the scholar's mind, is a mortal human being's; and this apology of his for being a little lower intellectually than his Creator therefore betrays a mood that is the antithesis of modesty. The scholar-hypocrite also stands convicted of negligence, because a scholar's proper study is the modest but useful task of producing, within the brief span of time that is the inexorable limit of the longest human life, some provisional addition to human understanding which this intellectual worker bee's contemporaries and successors can use, criticize, improve, and eventually discard in favour of other slightly closer provisional approximations to an ineffable divine truth. The transient scholar of the day would have done his intellectual duty and have won his spiritual crown if, in passing through This World, he had made it his business, following the example of the first two servants in the parable of the talents,² to contribute one fresh thimbleful of water to the great and growing stream of collective human knowledge.³

In hiding the talent entrusted to him in the earth,⁴ or keeping it laid

¹ Dan. v. 27.

² Matt. xxv. 14-30; Luke xix. 12-26.

³ 'The thought once worked out to the point of written record is complete, its work done. It is a fragment, a grain, added to the thought of the Universe, a grain of sand added to the ever-growing edifice of God.'—Walter Leaf, quoted by Charlotte M. Leaf in *Walter Leaf* (London 1932, John Murray), p. 167.

⁴ Matt. xxv. 25.

up in a napkin,¹ he has shown himself to be an unprofitable servant.² He has left open merely the question whether the motive of his misdemeanour was disaffection or sloth;³ and the charge of slothfulness is one from which he cannot clear himself by filing evidence to prove that he has sat at work for six and a half days out of every week and for ten and a half hours out of every day; for the unprofitable scholar's dreaded post-mortem examiner will not fail to parry this plea by asking the prisoner at the bar what kind of work his has been; and every scholar knows that he is under constant temptation to postpone or evade the ordeal of doing creative work on any plausible excuse, because this kind of intellectual work, which is the only kind that has any intrinsic and ultimate value, is also the kind that exacts the most excruciating and most repugnant intellectual travail. The inborn spiritual frailty which tempts every human being at all times to renounce his birthright of sharing in the bliss of creation for the sake of escaping its pangs tempts the scholar at his desk to go on reading, so long as he can find any excuse for this, instead of taking up his pen to write, and then, when that excuse fails him, to write, not those painfully-begotten winged words that are required in order to convey one mind's thoughts to another mind, but a string of facilely pedestrian entries on the cards of a bibliographical index. This perpetual human proneness to take the easier option is as natural, but also as culpable, in the scholar as it is in other men.

The intellectual mistake inherent in the pursuit of omniscience is, like the moral error, a multiple one; and the beginning of evils here is a mistaken identification of innumerability with infinity. It is true that human souls have an inborn need to put themselves in tune with the Infinite on the intellectual plane as on every other; but, on this plane, as on the rest, the only way in which a communion with the Creator is ever attainable by the creature is, 'like a light caught from a leaping flame',⁴ through a personal encounter. Omniscience, as Faust's insatiable mind discovered to its discomfiture, cannot be attained by adding item to item, art to art, and science to science in an infinite regress.

Habe nun, ach! Philosophie,
Juristerei und Medizin,
Und leider auch Theologie!
Durchaus studiert, mit heissem Bemühn.
Da steh' ich nun, ich armer Tor!
Und bin so klug als wie zuvor . . .
Und sehe dass wir nichts wissen können!
Das will mir schier das Herz verbrennen.⁵

Faust has, in fact, as we have noticed in an earlier context,⁶ merely succeeded in imprisoning himself in the immobility of a Yin-state. Yet in Goethe's tragedy the hero is deemed to have succeeded in his misguided intellectual endeavour at least to the extent of acquiring all the information accessible to any scholar in his ephemeral time and transient place. Here, however, Goethe has allowed himself a poetic licence; for,

⁶ In II. i. 276.

as the present writer learnt at an early age from his Mother, Dante had been the last man in Western history who had actually mastered all the Western lore of his day; and even the sixteenth-century historical prototype of Goethe's Faustian projection of his own eighteenth-century self had been born too late to emulate Dante's achievement in real sixteenth-century life.¹

Since Dante's time, Western scholars had been seeking to solve a self-imposed insoluble problem by electing to 'know more and more about less and less'; but this procedure had been merely more perverse than a Goethean Faust's without having been, in truth, more practical; for, as fast as each Western scholar was reducing the diameter of his boring in the hope of being able still to drill deep enough to strike oil, an advancing Western science was demonstrating that infinitesimal quanta were as infinitely complex as quanta of an infinite positive immensity; and, even if the pursuit of infinitesimals had proved to be less chimerical than the pursuit of infinite magnitudes, the academic huntsmen could have made nothing of their captured intellectual quarry; since, as we ascertained in the opening chapter of this Study,² it is impossible for human minds to emulate an eternal-instantaneous divine comprehension of an infinite-infinitesimal Here-Now by piecing together scraps of information, produced by a division of intellectual labour, in an intellectual assembly plant constructed on the analogy of a post-industrial Western factory. To an historian's eye the last judgement on the mania for encyclopaedism of both the microscopic and the telescopic variety had been pronounced by History herself; for this mistaken intellectual ideal had been apt to be the last intellectual folly to be abandoned by a senile civilization *in extremis* and the first to be abandoned by an infantile civilization³ as soon as the time had come for it to put away childish things.⁴

The present writer—to illustrate this point, too, *ad hominem*—had once gone through the stultifying experience of taking this wrong intellectual turning.

The writer had first been made aware of the choice in his eighteenth year, when, in December 1906, he had been staying with a pair of distinguished scholars in the persons of his uncle Paget Toynbee (*vivebat* A.D. 1855–1932), the author of *A Dictionary of Proper names and Notable Matters in the Works of Dante*,⁵ and his aunt Helen Toynbee (*vivebat* A.D. 1868–1910),⁶ the editor of Horace Walpole's letters. At the close of an agreeable and stimulating visit, in which the boy had unselfconsciously disclosed historical interests embracing the Assyrians, the Fourth Crusade, and whatnot, he was chilled by a piece of parting advice which his uncle gave him out of the kindness of his heart. 'Your Aunt Nellie and I',

¹ The historical Dr. Faust is believed to have lived *circa* A.D. 1480–1540.

² In I. i. 1–8.

³ Encyclopaedism was, as we have noticed in X. ix. 53–57, a weakness of the Sinic, as well as the Hellenic, Civilization in its last phase; and, like the Hellenic again, the Sinic Civilization bequeathed this weakness to its successors. This heritage of encyclopaedism perhaps partly accounts for the subsequent emergence of a system of education by examination in the Far Eastern and in the Western World alike; but the latter-day Far Eastern examinees were at least less unfortunate than their Western fellow-victims in being exempt from the terror imported into an intellectual ordeal by the Zoroastrian-Osirian myth of a Last Judgement.

⁴ 1 Cor. xiii. 11.

⁶ *Née* Helen Wrigley, of Bury, Lancs.

the Dante scholar had announced, 'have come to the conclusion that you have been dispersing your interests too widely, and our advice to you is to make your choice of some single subject and to concentrate hereafter on that.' In A.D. 1952 the writer had a still freshly vivid recollection of his own instantaneous conviction that this advice was bad, and of his likewise instantaneous decision not to follow it; and his uncle subsequently gave him reason in retrospect by amiably sacrificing his own pernicious intellectual principles on the altar of personal affection when his wife's literary work was cut short by her premature death. From that day onwards, her loving survivor took her Walpole, as well as his Alighieri, under his wing in order to complete her edition of the letters as a labour of love.¹ Meanwhile, his nephew was heading, in spite of his good resolution at the end of the year A.D. 1906, towards the intellectual blind alley from which the Dante scholar was to be harshly extricated in A.D. 1910 by a tragic event in his personal life.

During eleven years of adolescence, from the autumn of A.D. 1900 to the summer of A.D. 1911, the present writer was continuously at the stretch in the intellectual hurdle-race of alternately preparing for and sitting for examinations; and the cumulative demoralizing effect of this ordeal slowly but surely undermined his resolve never to allow himself to be corralled in a specialist's pound. As late as his last undergraduate academic year A.D. 1910-11, he was still wholesomely shocked to find the dismal orthodox cult of specialization capturing an older contemporary of his, G. L. Cheesman, who at school had gone out of his way to stimulate his junior's interest in the Late Roman Empire after having noticed that the younger boy was reading Hodgkin's *Italy and Her Invaders*.²

With these exhilarating memories of the catholicity of his older friend's intellectual interests still fresh in his mind, the writer, one day at Oxford, had come straight to Cheesman's rooms in New College (where Cheesman was then a tutorial fellow, teaching Roman history) from a meeting in Dr. F. W. Bussell's rooms at Brasenose which this mature scholar had convened in the hope of generating in Oxford a wave of interest in Byzantine studies. On separating, we had agreed to widen our circle by recruiting brother enthusiasts, and the writer had taken it for granted that his schoolfellow at New College would be as enthusiastic

¹ Paget Toynbee was handsomely rewarded for an unprofessional human piety that had taken for its counsellor an unerring heart instead of a fallible head. For one thing, he became almost as highly distinguished in the field of scholarship bequeathed to him by his wife as he had long since been in his own field. But his most gratifying reward was that, when he had made room in his quiver for Horace Walpole's works beside Dante's, he found himself armed with an unfailing store of apt quotations. It was hardly possible for there to be any event in the news which a scholar who had thus made himself a double *hâfiz* could not illustrate by a passage from one or other of the two authors whose works this intellectual archer now knew by heart. On the slightest provocation he would shoot a letter, containing a quotation from either Walpole or Dante, at the editor of *The Times*; and, as the quotation was always attractively felicitous and the covering letter always discreetly short, the literary arrow usually went home and, in the course of years, the deft archer scored a prodigious tale of hits. Thus, thanks to his unprofessional addition of a second string to his academic bow, Paget Toynbee succeeded in lodging in the columns of *The Times* a quantity of letters that can hardly have been equalled by any of his contemporaries.

² Hodgkin, Thomas: *Italy and Her Invaders* (Oxford 1892-9, Clarendon Press, 8 vols. in 9 parts).

over Dr. Bussell's project as he was himself. To his surprise and discomfort, his confident approach was met by his friend with a vehement refusal that would have been becoming in a conscientious novice, bent on qualifying for admission to a rigorous monastic order, if Mephistopheles had approached him with some tempting alternative proposition. The apprentice tutor hastily explained that his manifest duty, now that he had obtained his appointment as a don, was to concentrate on the task of mastering the particular subject for the teaching of which he had made himself responsible to his college. Now that he had found the confines of his intellectual province, 'pastures new'¹ were henceforward out of bounds for him. His refusal to indulge his personal interest in Byzantium any further was decisive,² and his baffled tempter went away crestfallen yet unshaken in his own intellectual convictions by his admired friend's distressing lapse from intellectual grace.

After having been appointed in his turn, in the summer term of A.D. 1911, to a tutorial fellowship in Greek and Roman history at Balliol, and having subsequently taken his final academic examination in the School of *Litterae Humaniores*, the writer still saw light enough to lead him to make a resolve never to sit for any further academic examination in his life, and this was a vow which he had faithfully kept at any rate till his sixty-second birthday, on which he was writing these words. Yet the morrow of his final examination was the moment of his own fall; for the shades of the examinational prison house in which he had been doing hard labour for eleven years past now closed on him with the swift downrush of a tropical night. It was an idle gesture to foreswear further examinations in real life at a moment when he was capitulating to the intimidating spectral presence of an imaginary examiner post mortem.

After having spent two and a half years in preparing himself for being examined by fellow mortals in the summer term of A.D. 1911 in the history of the Hellenic World between 776 and 404 B.C., the writer proceeded to spend the ensuing long vacation on reading all the extant sources for the period following, and he had ploughed his way on through these from the end of the Great Atheno-Peloponnesian War to the death of Alexander the Great when he was mercifully interrupted by the advent of the day on which he was to start on a grand tour of Paris, Rome, and Athens as a prelude to returning to Oxford as a don in the autumn of A.D. 1912. From the moment when he found himself *en voyage*, an inborn passion for making a countryside his own by walking over it happily diverted him from spending more than a minimum of his travelling time in museums and libraries, reading books that would be accessible to him in England and poring over *objets d'art* which he could continue to study elsewhere in casts and photographs. He had the wit to realize that

¹ Milton: *Lycidas*, l. 193.

² How much longer G. L. Cheesman would have persisted in exploring his blind alley could never be known, since, some four years later, in A.D. 1915, he was killed on landing on the Gallipoli Peninsula. The present writer's personal belief is that, had he lived, he would have become the greatest Roman historian in his generation; and this belief is founded on the further belief that, possessing the magnificently inquisitive mind that he did possess, this potentially great scholar would soon have repented of his unfortunate resolution to try to make himself a Roman historian by the *via negativa* of refusing ever to be anything more than that.

the landscape of the Hellenic World was the spectacle which he must make sure of seeing with his own eyes because this was the field in which there was no substitute for autopsy; but, even then, he perversely strove at first to exclude from his contracting field of vision every scene that was not either Hellenic or Minoan.

It was through the grace of God, and not thanks to any native common sense, that other worlds did impinge upon the academic pilgrim's consciousness. In Paris during the week running from the 22nd to the 28th September, 1911, the reverberations of the Agadir Crisis did just patter, like spent bullets, against his ear-drums through the archaic iron lattice-work of the Eiffel Tower. *En retour* to Rome on the evening of the 8th November, 1911, from an expedition to visit the Etruscan tombs at Cerveteri and Corneto, the young antiquarian did ascertain that his fellow-passengers in the train were Neapolitan conscripts, and did notice, as the train passed through Civit  Vecchia, droves of other young Italian soldiers, with a look of unenthusiastic resignation on their faces, in the act of embarking for the theatre of war in Tripolitania and Cyrenaica. At Brindisi on the 18th November, 1911, he had to transfer to a Greek steamer from the Italian one on which his passage to Patras had been booked, because the Italian boat was shy of running the gauntlet of an enemy Turkish coast between Acroceraunus and Pr veza; and during the next eight months, passing his evenings in caf s in Greek villages, he heard, for the first time in his life, 'the foreign policy of Sir Edward Grey' being discussed, and the question whether 'the war' would break out this spring or next being canvassed by peasants and shepherds in zestful conversation with brothers and cousins just back home, with gold five-dollar pieces and napoleons in their wallets, from following the gainful occupations of shining shoes in Kansas City or selling fruit in Omaha. Meanwhile, in the landscapes of Continental Greece and Crete, Medieval French castles and Early Modern Venetian fortresses were competing for his attention with Hellenic temples and with Minoan palaces.

Twice, on that antiquarian tour, the Oxford don-elect was arrested as a Turkish spy, first on the evening of the 16th November, 1911, on the last lap of a day's march from Terracina to Formia, by an Italian carabinieri,¹ and then again, on the 21st July, 1912, by a Greek military patrol.² At Cattaro and Ragusa in August 1912 he found the streets thronged with Austro-Hungarian troops in a picturesque variety of old-fashioned uniforms reminiscent of the revolutionary year A.D. 1848. At

¹ On this occasion, the suspect was able to clear himself by showing a card with 'Balliol College, Oxford' engraved on it. 'Ah! Collegio! Dunque non siete Turco', reasoned the intelligent Italian security officer, and straightway left the suspicious-looking traveller in peace. Forty years later, in A.D. 1952, the carabinieri would, of course, no longer have been justified in acting on an *a priori* assumption that 'Turk' and 'college' were incompatible ideas.

² On this second occasion, he was arrested on the reasonable charge that he had walked across the perilously vulnerable railway viaduct over the gorge of the River Asopus at Eleftherokh ri, where the sole railway running from Athens to the Graeco-Turkish frontier leaped across a chasm to come to earth again along the eastern flank of the Hellenic citadel of Trachis. This charge was supported by the less convincing argument that the trespasser must be a foreign military spy because he was wearing insignia in the shape of a military water-bottle that was not of the pattern affected by the Greek Army.

Trieste he gazed at the red fezes of a Bosniak regiment in garrison in the castello, and listened to an old Triestino explaining in Italian to a little boy that these were now loyal soldiers of the Emperor-King, though their fathers had made it hot for the old man and his comrades in A.D. 1878, when they had been serving in the expeditionary force that had been sent by the Imperial-Royal Government to occupy Bosnia in that year. Next day, in his through-carriage from Trieste to Flushing, he noticed quantities of German soldiers drilling in green fields sandwiched between greener hop-gardens in Bavaria, without registering any sharper impression from this ominous sight than he had received, eleven months earlier, from the headlines displaying the latest news from Agadir in special editions of the Parisian Press. He had no sooner reached his journey's end at Southwold than, finding himself in hospital with dysentery contracted through drinking treacherously clear running water from a stream between the mouth of the River Eurotas and the town of Yýthion, he plunged back into the reading that he had had to interrupt in the previous September. Before he was convalescent he had finished reading Strabo's *Geographica* and had started reading Pausanias' *A Personally Conducted Tour of Hellas*; and, before he had finished with Pausanias during his first term at Oxford as a don, he had begun to suffer acutely from the nemesis that is the penalty for the quest of omniscience within however narrowly restricted an intellectual allotment.

A scholar in quest of intellectual omniscience is, indeed, courting the same nemesis as a soul in quest of spiritual perfection. Each successive advance that he makes towards achieving his ideal sends his standard soaring higher in a geometrical progression that leaves his arithmetically progressing attainments ever farther behind. Just as the aspirant to sainthood is the more crushingly self-convicted of sin each time that he attains a yet loftier spiritual altitude above the ceiling of ordinary mortals, so the aspirant to omniscience is the more crushingly convicted of ignorance each time that he makes a fresh addition to an already super-human stock of knowledge. In both careers the gap between aim and achievement thus grows only the wider the greater the achievement comes to be; and the nemesis of this inevitable progressive defeat, in a race which a finite Human Nature has condemned itself in advance to lose by impiously pitting itself against God's infinity, is a moral regress from frustration through disillusionment into cynicism.

After having tasted for himself the pains of this unprofitable pursuit of an hallucination, the present writer was liberated from the spell of an imaginary implacable post-mortem examiner by an intellectual event in his own *for intérieur* that had nothing to do with the wars and rumours of wars¹ which, from the outbreak of the First Balkan War on the 17th October, 1912, to the outbreak of the First World War on the 1st August, 1914,² were bearing down upon the Western World with a roar that was growing louder as fast as the thunder of an approaching express train.

In the summer of A.D. 1911, during his intensive course of reading

¹ Matt. xxiv. 6; Mark xiii. 7; Luke xxi. 9.

² Germany was at war with Russia by that date. Great Britain did not find herself at war with Germany till the 4th.

the original Greek sources for the history of the Hellenic World in the fourth century B.C., the writer's conscience had been troubled at intervals by finding himself occasionally falling short of his daily stint of reading because his mind had been insisting upon breaking with its habit of acquiring additional information in order to allow itself to begin putting two and two together. Pieces of information about the organization and numbers of the Lacedaemonian Army, at divers dates in the fourth century, which were presented by Xenophon incidentally in the course of his narrative, confirmed a dissatisfaction that had been implanted in the writer's mind, during his previous reading for the School of *Litterae Humaniores*, by Thucydides' presentation of the Lacedaemonian order of battle at Mantinea in 418 B.C.¹ What was more, the data supplied by Xenophon seemed to provide clues for tracing Thucydides' mistake—if he had indeed made a mistake—to its source and for penetrating, behind this error, to the truth. The question at issue was the ratio, at divers dates, between the respective strengths of the Spartiate contingent in the Lacedaemonian Army and the Perioecic contingents; this question turned, in the last analysis, upon the ratio between the respective areas of the arable land in the home territory of Sparta herself and in the aggregate of the territories of the Perioecic city-states in the Lacedaemonian dominions within their frontiers at the time; and this was a question, raised by reading, which could be settled only by autopsy.

In consequence, when, a few months later, the writer found himself in Greece, the historical inquiry which had already come into action in his mind conspired with the alluring beauty of the landscape in Messenia and Laconia to lead him into an inquisitive reconnaissance of the Perioecic states and their domains;² and this deliberate autopsy in A.D. 1912 reinforced the undesigned effect of his reading in A.D. 1911. The field work and the book work, between them, activated his mind to a degree at which a salutary impulse to take action gained the upper hand in A.D. 1913 over an insatiable craving to add still further to a hoard of inert knowledge. In that year he wrote and published an article on 'The Growth of Sparta';³ and he had not had time to relapse into another debauch of aimless reading before the outbreak of the First World War compelled him to cease work on a history of the Hellenic World,

¹ See Thucydides: *A History of the Great Atheno-Peloponnesian War*, Book V, chaps. 64-74.

² In *ci-devant* Lacedaemonian territory the writer's itineraries in A.D. 1912 were as follows (the dates being those of nights passed at the places with which the dates are here coupled):

Kalamáta (by train from Athens) 20th February, Koron 21st, Navarino (via Módhon) 22nd, Philiatrâ 23rd, Olympia (via Arkadhiâ, *alias* 'Kyparissia') 24th.

Astros (by boat from Ermióni, via Pétses and Lenidhi) 15th April, Arákhova 16th, Sparta (via Sellasia) 17th-19th; Yeráki 20th, Moláous 21st, Neápolis-on-Malea 22nd, Monemvasia 23rd, Hiéraka (via the fjord) 24th, Káto Vezáni 25th, Yýthion 26th-27th, Pálos-on-Taenarum 28th, Pálos-on-Taenarum 29th, Kótronas-in-Máni 30th, Tsímovavon 31st May, Liméni-in-Máni 2nd, Kalamáta 3rd, from Kalamáta by train to Athens 4th.

The kháni of Khelmós (from Sinán, *alias* 'Meghalópolis') 19th May, Sparta 20th-22nd, Trýpi (via Mistrá) 23rd, Kalamáta 24th, Mavrommáti (via Ithômé) 25th, Pávlitsa (Phigaleia) (via Sulimá) 26th.

³ See *The Journal of Hellenic Studies*, vol. xxxiii (London 1913, Macmillan), pp. 246-75.

which he had just started to write for the *Home University Library*,¹ and impelled him to write and publish a book on the redrawing of the political map of the World in a forthcoming peace-settlement.² After that, the financial pressure of rising prices on the budget for a growing family completed his education in intellectual action by driving him into journalism as fuel for 'pot-boiling'. He had been saved so as by fire,³ and he had found this salvation by making the simple discovery that his curiosity had been given to him, not in order to be turned loose to eat its head off on the pastures of a boundless prairie, but in order to be harnessed and put to work. When once he had embarked on a literary enterprise with a plan that determined its shape and with a shape that delimited its contents, he had found an intellectual talisman that had power to ban the demonic subconscious psychic force which had been tormenting him so long as he had been allowing himself to remain its slave instead of insisting upon making himself its master. In Hellenic language, he had succeeded in setting a limit (*πέρας*) to a previously unlimited chaos (*τὸ ἄπειρον*) which Hellenic minds had rightly abominated because they had correctly discerned that, at any moment, it might flood in upon them and overwhelm them.

By A.D. 1952, thirty-seven years and more after this decisive turn in the course of his intellectual life in A.D. 1913-15, the writer had long since worked out for himself an intellectual regimen that was the inverse of the course that he had followed in A.D. 1909-13. He had accustomed himself since then to making writing, not reading, the first charge on his time and energy. The reading and travelling that were requisite preparations for this writing had been left to fend for themselves; but at the same time the writer had learnt not to be so improvident as ever to give himself an excuse for suspending the hard labour of intellectual creation in order to indulge in the softer options of travelling and reading through having permitted himself to neglect to make the necessary intellectual preparations betimes. He had formed a habit of prompting himself to gather the required information a sufficient number of months or years ahead of the date at which he expected to reach the corresponding points in his agenda to ensure that the continuous flow of writing should never have to be checked.

In thus giving his intellectual energy an ever-open vent in action, this adult regimen had liberated him from the painful tyranny of a curiosity which, before it had been thus bitted and bridled, had been apt to be the more insatiable in its demands the more lavishly he had indulged it. Since A.D. 1916 he had been practising the trick of blunting the edge of any residual craving by keeping an amateur bibliographical card index of published works in the field of History interpreted in the broadest sense; but he had always taken care to confine this side-line of his intellectual activity within limits very far short of any professional pretension to exhaustiveness; for the appalling spectacle of the debauchery of potentially creative minds had soon taught him that a collector's mania to inscribe *ad libitum* dates, titles, and names of authors and publishers on

¹ See p. 22, above.

² *Nationality and the War* (London 1915, Dent).

³ 1 Cor. iii. 15.

cards might be no less sterilizing than the bookworm's hunger to devour *ad libitum* the pages between the covers. While thus holding himself on the alert to keep his curiosity in order, the writer took care, however, not to put it to death, for that would have been as fatal a step in real life as the killing, in the fairy story, of the goose that laid the golden eggs. The proper course with curiosity is, not to kill the precious bird, but to clip its wings in order to make sure that it shall not fly away with its possessor. Curiosity is given to the mind to serve it as a bow serves a bow-string. The bow acquires the power to shoot only if and when the string bends it; and the mind must handle its curiosity as imperiously as the bow is handled by the string. It must insist on being the possessor, not the possessed, if its potentialities for creative work are to be realized; for the price of continuous creation is a perpetual tension.

The writer owed his narrow escape from intellectual perdition on the morrow of his completion of a standard Western course of education-by-examination to the happy accident of stumbling ingenuously upon a truth that might have been dismissed as a truism if so many once intellectually promising Western minds had not notoriously overlooked it to their undoing. This truth which is so obvious yet is so frequently ignored by scholars is the truth that Life is Action. A life which does not go into action is a failure; and this is just as true of a prophet's, a poet's, or a scholar's life as it is true of the life of 'a man of action' in the conventionally limited popular usage of the term. When Faust revolted against his servitude to the cult of a barren omniscience, the rebel scholar's thirst for action was salutary (though he need not consequently have fallen into the crude error of fancying that the only effective remedy for his academic complaint was to let Mephistopheles inoculate him with a *rabies Teutonica*).

Geschrieben steht: 'Im Anfang war das Wort!'
 Hier stock' ich schon! Wer hilft mir weiter fort? . . .
 Mir hilft der Geist! Auf einmal seh' ich Rat
 Und schreibe getrost: 'Im Anfang war die Tat!'¹

On a scholar's tombstone the epitaph *obiit rê infectâ* is just as damning as it is on a business man's, a statesman's, or a soldier's.

Why is it, then, that scholars are apt to be so much less alive to this fundamental common law of Man's calling than the general run of 'men of action' in the conventionally limited sense? The conventional limitation of the meaning of the phrase gives us a clue. Why has a phobia against taking action become the scholar's distinctive occupational disease? Perhaps the answer is to be found in the fact that action is a genus of divers species which have different terms and ranges because they operate in different media.

This was the discovery of the Hellenic philosopher who first drew a distinction between the life of longer-range activity (*ὁ θεωρητικὸς βίος*) and the life of shorter-range activity (*ὁ πρακτικὸς βίος*); but Plato, at any rate, never intended to convey the false suggestion—subsequently crystallized in a latter-day Western usage of the derivative words 'theory'

¹ Goethe: *Faust*, II. 1224-5 and 1236-7.

and 'practice'—that the antithesis between two different kinds of action was really an antithesis between action and inactivity. Plato was alert to warn insouciant candidates for initiation into his philosophy that 'the sole way of acquiring it' was 'by strenuous intellectual communion';¹ and Elijah, when he heard the still small voice after the fire and the earthquake and the wind, was instantaneously and indubitably aware that he was now in the immediate presence of the spiritual Power that was the source of all the action in the Universe.² The 'great and strong wind' that 'rent the mountains and brake in pieces the rocks before the Lord' had come and gone, in advance of its Maker and Master, in order to put Elijah's prophetic intuition to the test. Elijah had to show, by waiting on the Lord, his recognition that the blustering physical force was merely one of God's mighty works, not Almighty God Himself, before he could hear God's voice and receive His commands. Elijah knew, as Lao-tse knew,³ that the stillness of the Fount of Life, Wu Wei, is in truth a plenitude of activity which looks inert to uninitiated human eyes only because, being human, they are not born to see the Absolute as it really is.

Prophets, poets, and scholars are chosen vessels who have been called by their Creator to take human action of an etherial kind that is perhaps less unlike God's own action than any other kind that Human Nature can compass; and in this, as in every other, form of encounter between God and one of His creatures an ordeal is the price of a privilege; for the truth that Life is Action is as hard a saying for the tender-minded follower of a higher spiritual calling as it is an obvious platitude for the man of action who has been called to act on spiritually lower levels. Elijah himself had to be called to order by the Word of the Lord from a culpable truancy prompted by a despair that had been the nemesis of a loss of faith.⁴ But this sin of omission, which is the besetting sin of prophets, poets, and scholars, does not beset business men or fighting men. When Hector and Ajax, striving with one another in physical combat on the Plain of Troy,⁵ had each hurled his spear at his adversary without putting him out of action, neither warrior was tempted to stand at ease, since neither needed to be warned that if he did so he would instantly lose his life through having his throat cut by his adversary's sword. These warriors' sense of action was so keen that, without pausing to lose time in drawing their swords, they picked up the boulders at their feet and hurled these at one another; and, when these bolts, too, had been shot without producing a military decision, the liaison officers did not find themselves required to push the champions into continuing the struggle; on the contrary, all their tact had to be brought into play in order to induce Ajax and Hector to keep their swords in their scabbards and break off the action for that night at least.

Hector and Ajax did not need to be told that Life is either action or failure; but these were warriors equipped for hand-to-hand fighting with weapons that had no sooner been discharged than they registered

their hit or miss at a point-blank range at which their objective was in full view. By contrast, the prophet's, poet's, and scholar's spiritual armament resembles an archer's who is aiming at a target which is too far distant to be visible.

I shot an arrow into the air,
It fell to earth, I knew not where;
For, so swiftly it flew, the sight
Could not follow it in its flight.

I breathed a song into the air,
It fell to earth, I knew not where;
For who has sight so keen and strong,
That it can follow the flight of song?

Long, long afterward, in an oak
I found the arrow, still unbroke;
And the song, from beginning to end,
I found again in the heart of a friend.¹

'Cast thy bread upon the waters, for thou shalt find it after many days.'² Ajax or Hector could not delude himself into imagining that his target, standing there before his eyes within a stone's throw, could ever be hit by his stone if he himself were to forbear to take the necessary action of picking the stone up and hurling it. The ineptitude of expecting inaction to produce an unperformed action's effect is the occupational folly of the archer whose target is out of sight or of the speculator whose return on his outlay lies hidden in a future beyond his mental horizon.

In thus outranging 'practical' action in the dimensions of both Space and Time, spiritual action shows itself to be the more godlike of the two kinds. An Agamemnon who has lived his brief physical life in the lime-light owes his literary immortality to a poet who has died in obscurity. The Homeric poems continue to move men's hearts and kindle their imaginations for ages after the ephemeral empire of Mycenae has ceased to have any perceptible effect on the political surface of life; and the long file of strong men armed who, before Agamemnon, must have stalked across the stage of History has passed into oblivion because these predecessors of Homer's hero failed to find a poet to make them famous.³ Yet, just because Human Nature's spiritual activities have this divine power of producing effects at distances thousands of miles and years away from the human agent's own birthplace and lifetime, souls that have been called to these spiritual vocations are prone to stultify themselves, and to make failures of their lives, by overlooking the crucial difference between long-range action and inactivity—as if, just because the archer's target happens to be out of sight, it were any more feasible for him to hit it without ever shooting an arrow than it would be

¹ Longfellow: *The Arrow and the Song*.

² Eccl. xi. 1.

³ Horace: *Carmina*, Book IV, Ode ix, ll. 25–28. Homer's continuing dominion over the imagination of Posterity was still so potent in a nineteenth-century Western World that, when Heinrich Schliemann was at last ruefully convinced by the arguments of his expert advisers that the royal bones which he had disinterred at Mycenae were those of *fortes ante Agamemnona*, not those of the Homeric heretoga and his contemporaries, he was disgusted. "What?" he exclaimed on one occasion. "So this is not Agamemnon's body, these are not his ornaments? All right, let's call him Schulze".—Ludwig, E.: *Schliemann of Troy* (London 1931, Putnam), pp. 296–7.

for the swordsman to smite his adversary in hand-to-hand combat without ever striking a blow.

If Acton's calling,¹ no less than Ajax's, is thus in truth subject to an inexorable law that Human Life is either action or failure, then we must write off the scholar's cherished boasts as vapourings of an intellectual *miles gloriosus* who, in uttering them, is convicting himself of incompetence in the profession that he has chosen. When the devout disciples of Robert Browning's dead grammarian² sing of their master that he 'sucked at the flagon', we shall agree with them that he was 'soul-hydropic', but we shall dispute their claim that his thirst was 'sacred'. When they ask 'How should Spring take note Winter would follow?' we shall reply that human souls are distinguished from 'the beasts that perish'³ precisely by a God-given power to 'look before and after'.⁴ When they quote his exclamation 'Let me know all! Prate not of most or least', we shall interpret this as either a childish petition to God or an impious emulation of His Almightyness. When they comment

Others mistrust and say 'But Time escapes:

Live now or never!

He said 'What's Time? Leave now for dogs and apes!

'Man has Forever',

we shall reply that Time is the medium in which God has ordained that Man shall live and work in This World, *vitaque mancipio nulli datur, omnibus usu*.⁵ 'Eschew a line of study in which the work done dies together with the worker'.⁶

Man does not have 'Forever'—God's Eternal Now—in mortal human life. The grammarian's desperate assertion is not even true of the Collective Mankind that accumulates, in the course of successive generations, an increasing corporate heritage of Science and Technology; for even this human coral reef would never have come into existence if each of the innumerable animalculæ that have co-operated to build it up had not performed the positive individual act, within its own brief lifetime and narrow field of operations, of mixing and carrying a minute contribution of mortar in its tiny hod. The collective achievements of Science and Technology do not accomplish themselves automatically any more than the unique achievements of Poetry and Prophecy. Like these, they owe their existence to creative acts of individual souls who have had the sense and grace to take action under the conditions laid down for human beings in This Life by their Creator. We therefore shall refuse to call a homunculus who has kept his talent laid up in a napkin⁷ a 'high man' for missing a unit through aiming at a million; for, if it is the truth that he has 'a great thing to pursue', he has no business to die ere

¹ Acton's incapacity for taking intellectual action, and the sterilizing effect of this psychic inhibition upon that great Modern Western historian's intellectual career, have been noticed in I. i. 46-47.

⁷ Luke xix. 20.

he knows it. Even if we were to concede (as we do not) that the grammarian's conduct is *magnifique*, we should be bound, none the less, to damn it by pronouncing that *ce n'est pas la guerre*;¹ for it is not

God's task [*sic*] to make the Heavenly period
Perfect the Earthen.

It is Man's task to execute, within the time that God allots to him on Earth, a human mission to do God's will by working for the coming of God's Kingdom in Earth as it is in Heaven; and, when a man irresponsibly throws back on God the task that God has set him in This Life, we cannot agree with the grammarian's disciples in their confident assumption that God 'loves the burthen'. Say, rather, God loves to see His will done by 'that low man' who, in the strength of a sincerely God-fearing humility,

seeks a little thing to do,
Sees it and does it.

The doing of it is what matters in God's sight; for Acton, no less than Ajax, has been created by God to take action² under the divinely appointed conditions of Man's Earthly Life.

If scholarship is indeed subject, like every other human vocation, to the necessity of having to choose between going into action and being a failure, a scholar is being untrue to his calling if he retorts to God's special challenge to scholars—*Ars longa, vita brevis*³—by throwing in God's face the defiant falsehood 'Man has Forever' instead of eschewing rhodomontades in order to concentrate on the prosaically workmanlike job of cutting his coat according to his cloth. A scholar is no more justified than any other man of action in shirking the workman's duty of making an inventory of the materials and tools, and an estimate of the time and energy, that are at his disposal for executing the commission which has been entrusted to him. To leave his talent hidden in the Earth till his corpse is lowered into the grave to rot beside it is a sin of omission in which criminal negligence swells to the dimensions of high treason. The intellectual, like the manual, worker has, at the longest, one

¹ Comment by the French Maréchal Bosquet on the charge of the British Light Brigade at the Battle of Balaclava in the Crimea on the 25th October, 1854.

² The poet himself, of course, testified to this truth by producing his works; for Robert Browning was a happily uninhibited man of action on the plane of his own imaginative art. His own detestation of 'the unlit lamp and the ungirt loin'—'the sin I impute to each frustrate ghost'—is declared in *The Statue and the Bust*. The poem that we have been dissecting in the present chapter is a particularly brilliant example of Browning's gift for entering imaginatively into the experience, feelings, and thoughts of souls whose temperaments differ widely from his own, but there is one passage in *A Grammarian's Funeral* where the author of *Dramatic Romances* can be caught napping.

He settled *Hoti's* business—let it be!—
Properly based *Oun*,
Gave us the doctrine of the enclitic *De*,
Dead from the waist down.

'Settled'! 'Let it be'! 'Properly based'! 'Gave us the doctrine'! Save the mark! Who but the incorrigible man of action that Robert Browning was would ever have credited an orthodoxly inhibited scholar with such unprofessionally conclusive conduct as this? If the dead grammarian really had taken action, he would hardly have thanked his disciples for these damagingly indiscreet revelations, and the disciples themselves might have hesitated to honour him, as they did, in their obsequies.

³ *Ὁ βίος βραχύς, ἡ δὲ τέχνη μακρή*—Hippocrates: *Aphorismata*, I. 1.

full working life to use to best advantage, and his own tenure of this life may, for all he knows, be shorter than the average; at every moment he has to reckon with the possibility that death, or the deadly living death of incapacitation, may pounce upon him next year, next month, next week, tomorrow, or today. With these pertinent hard facts of human life ever present in mind, he must take the brevity of life, and not the *longueurs* of intellectual dissipation, as the measure for his intellectual enterprises; he must keep his plans within human compass and must put these feasible plans into execution here and now; for, in real life, no miracle will intervene to enable Psyche to acquit herself of an impracticable task imposed upon her by an overweening Intellect, since it is one of the fundamental laws of Human Nature that an undertaking which is manifestly beyond the compass of a mortal man's or woman's maximum expectation of working time and energy is *ipso facto* convicted of being an undertaking that is inherently unsound. Indeed, an intellectual worker who is able and willing to learn by experience will discover that even the largest work of art that a human soul has the capacity to create will not necessarily occupy the whole length of the average span of a human working life.

In the creation of a work of art the actual length of the particular workman's working life is, of course, one of the limiting conditions; for, if his reasonable expectation of life is falsified in the event by the crash of Death's cruel coulter,¹ 'the best laid schemes' may 'gang a-gley'.² But the unpredictable limitations set upon human beings' opportunities for creation by the chances and changes of this mortal life are only external and negative; and the positive factor that determines the Time-span of an act of creation is one that is internal and intrinsic to the act itself. The artist's working tempo is set for him by a psychic chronometer, and the two hands of this human clock are the Intellect and its partner the sub-conscious well-spring of Spiritual Creativity. Human acts of creation are governed by a law of spiritual dynamics which can be conveyed in a mathematical simile. Each act has its own proper curve to describe at its own proper pace; and, in so far as it diverges from its inherent course, or takes this course slower or faster than its inherent speed, the action will be falling short, to that extent, of the optimum performance of which it is capable. In the incubation of each particular work of art, a human creator's soul has a corresponding particular period of profitable gestation which it will shorten or lengthen at its peril; and an egg that is allowed to go addled under the suffocating breast of a broody hen³ will be just as sterile as the still-born fruit of a premature birth.

¹ Burns, Robert: *To a Mouse*, stanza 5.

² *Ibid.*, stanza 7.

³ The error, to which scholars are notoriously prone, of spoiling their work by continuing to revise it after it has reached and passed its optimum state can often be traced to an infantile ignorance of one of the fundamental rules of art. The occasion on which the present writer had learnt this rule had made an indelible mark on his memory. On the 17th April, 1951, when he was writing this note, he could recall, as vividly as if it had been yesterday, a day in July, 1894, on which he was intently watching his Mother painting a water-colour sketch of a ruined church that then seemed to be on the verge of toppling over the edge of the cliff at Dunwich on the coast of Suffolk. When his Mother had finished the sketch and they were looking at it together, he pointed out to her that it was incomplete because she had put in only the ruined church wall and the seascape visible through its glassless windows, and had left out the luxuriant dock leaves and nettledbeds sprouting through the church's dislocated pavement (as sordid witnesses

The human creator, if he truly and earnestly intends to respond to God's call to co-operate with Him in His creative work, must speak to his anima in the poet-member-of-parliament Andrew Marvell's masterful words:¹

Had we but world enough, and time,
This coyness, Lady, were no crime. . . .
My vegetable love should grow
Vaster than empires, and more slow, . . .
An age at least to every part,
And the last age should show your heart. . . .
But at my back I always hear
Time's wingèd chariot hurrying near. . . .
Now therefore. . . .

and, with the sanction of Time's inexorable onset to enforce his demand, the man of action delivers Mortality's imperious ultimatum.

Now . . . while thy willing soul transpires
At every pore with instant fires, . . .
Let us roll all our strength and all
Our sweetness up into one ball
And tear our pleasures with rough strife
Thorough the iron gates of Life:
Thus, though we cannot make our sun
Stand still, yet we will make him run.²

of Man's ephemeral occupation of the site). His Mother answered quietly, but without hesitation, that the secret of sketching was to know what to leave out, and, fifty-seven years later, her son could still distinctly remember (though he could no longer reproduce in the unsophisticated language of a five-year-old child) the succession of thoughts that this notable answer sent chasing one another through his mind. His first thought was that, in leaving out the dock leaves, his Mother had shown something less than an absolute faithfulness to the truth, even though, for the moment, he could not put his finger on the weak spot in her defence. His second thought was that she had lifted a veil from his eyes and shown him the truth behind it.

This second thought was the one that had remained with him to illuminate him for the next fifty-seven years; and, indeed, within five years he had enjoyed the pleasant surprise of earning good marks at school for having passed in accordance with his Mother's invaluable precept. His class had been given a lesson in the importance of account of the reign of Queen Elizabeth from their memory of the anecdote of the princess's passage in a textbook of English history which they had been set to read. The passage in the textbook had opened with the anecdote of the princess's exclaiming 'This is the Lord's doing, and it is marvellous in our eyes' (Psalm cxviii. 23; Matt. xxi. 42; Mark xii. 11) when, sitting under an oak-tree in Hatfield Park, she had received the news that she was to ascend the throne and not the scaffold. When the essays were read and compared by the form master, it was found that several boys who were endowed with a better verbal memory than the writer's had reproduced this anecdote *verbatim* and had then been forced to break off, before they had been able to mention any of the events of Queen Elizabeth's reign, by the expiry of the time that had been allotted for the task. The writer had employed this Time-allotment in setting down what he had judged, from the textbook, to have been the principal events of the reign without mentioning the inaugural anecdote. To his astonishment the master not only commented on the difference between these two ways of handling the task, but told the class that the writer's way (i.e. his Mother's way) was the right one.

C. THE IMPULSE TO INVESTIGATE THE RELATIONS BETWEEN THE FACTS

(I) CRITICAL REACTIONS

IN our inquiry, up to this point, into the inspirations of historians, we have found that, if a child is to become an historian, its passive receptivity to the suggestions of its environment must pass over into an active curiosity to know the facts of History. While we have found that a child cannot become an historian, and an adult cannot remain one, if the mind's mill is not set and kept in motion by a perpetual flow of curiosity over the mill-wheel, we have also found that, if, instead of putting away childish things¹ after passing the threshold of manhood, the would-be historian then allows his curiosity to run amok, it is likely to lead him off in pursuit of the will-o'-the-wisp of omniscience, and that this is a wrong turning which leads nowhere.

What, then, is the right turning? 'Thinking means asking questions';² and, if the child is to become an historian in very truth and deed, it must learn to harness its curiosity about the facts to the service of something more purposeful and more creative than curiosity itself. It must come to be inspired with a desire, not just to know the facts, but also to divine their meaning;³ and this is a quest in which there are several successive stages; for the meaning of the facts may be found either in their relations with one another or in their relations with something that is embodied in them or in their relations with something that lies behind them. This quest is, indeed, ultimately a quest for a vision of God at work in History; and the first blind step along this pilgrims' way is a desire to understand how the facts of History hang together. In this investigation into the relations between the facts, the first mental movement is a critical reaction to apparent discrepancies, and the second a creative response to challenging phenomena.

In an inquiry into the awakening of the critical faculty in a would-be historian's mind, the writer was reduced once again to drawing upon his personal experience because no other first-hand evidence was accessible to him.

He could remember, for instance, how in March 1897, on a visit to some friends of his family's towards the end of his eighth year, he had broken out into exclamations of dissentient surprise when one of the grown-up people present had begun to expatiate on the goodness, abundance, and variety of the fare on a Transatlantic voyage from which he had just landed. The listening child could not accept a statement that was irreconcilable with what he had heard, time and again, straight from the mouth of his own great-uncle Harry, who was then still alive and who surely must be regarded as a greater authority, considering that he had

¹ 1 Cor. xiii. 11.

² Collingwood, R. G.: *The Idea of History* (Oxford 1946, Clarendon Press), p. 281. An illuminating presentation of this truth that questioning is the method of History will be found *ibid.*, on pp. 269-74 and 278-82.

³ Cp. Collingwood in *op. cit.*, p. 275.

been, not just a passenger on his own ship, but her captain. The child was never tired of hearing the old man telling how the mouldy taste of ship's biscuit was welcomely relieved by the sharp taste of a weevil when the eater's teeth happened to bite through one of the biscuit's living occupants, and how, when captain and crew from time to time lost patience with their fellow-travellers the rats, they would entertain themselves by organizing a rat hunt which would bring them in tasty rat-pie to supplement for the next few days their dull normal fare of salt beef and plum duff. These, the child knew for certain, were the facts, so this talk of high feeding on board ship could be nothing but a mendaciously spun traveller's yarn; and it was a revelation to him when the present traveller, just ashore from one of the Cunard or White Star liners of the day, explained good-humouredly, to the child who had been calling his veracity in question, that there had been a good deal of change in the conditions of sea-travel during the thirty-one years that had gone by since Captain Henry Toynbee's retirement from the sea in A.D. 1866. Thanks to this convincing explanation of the discrepancy which had startled the child's mind, it dawned upon it for the first time that human affairs were on the move, and that this movement might run so fast as to produce sensational changes within the span of a single lifetime.

The next discrepancy that exercised the writer's mind in childhood was one on which he stumbled in the first step that he took to enlarge a new vista of History that had opened up before his eyes at some date either just before or soon after the end of his ninth year. Having at that stage encountered and read, among four volumes in *The Story of the Nations* series, Z. A. Ragozin's *Media, Babylon, and Persia*,¹ which told the story of the Iranian-speaking peoples' entry on to the stage of Oecumenical History between the time of the decline and fall of the Assyrian Empire and the time of the Achaemenian Empire's collision with the Hellenes, he had become inquisitive to 'look before and after' into the antecedent and subsequent chapters of Iranian history, and had therefore chosen S. G. W. Benjamin's volume in the same series, entitled *Persia*,² for a present from his Aunt Elsie Marshall on his tenth birthday. Plunging into his new book excitedly, in the expectation of here beholding the entire Iranian historical landscape of which one tantalizing patch had been revealed to his eyes in *Media, Babylon, and Persia*, he found himself being led down unknown paths and began to race along these impatiently in the expectation of reaching an already familiar patch of Iranian history that would give him his bearings. Fifty-three years later he could still recall vividly his growing surprise and dismay as he gradually found himself forced to face the fact that Benjamin's and Ragozin's accounts of Iranian history were irreconcilable.

It was true that, at the beginning of Benjamin's seventh chapter,³ a familiar Cyrus was at last introduced as a synonym for an outlandish Kay Khusraw; but the young reader's mind was not satisfied by this apparently arbitrary and certainly abrupt transformation scene; and no impression was made upon it, at the time, by the author's unsatisfactorily

¹ See p. 18, above.

³ See Benjamin, *op. cit.*, pp. 82-86.

evasive plea¹ that it was not 'expedient in a volume of this size to go into a discussion concerning the discrepancies or historic difficulties that exist between the records of the Persian and the Greek or classic historians'.

The sorely perplexed reader did not, of course, get to the bottom of these discrepancies until many years later. He had first to take the point that the versions of the story given in the Achaemenian emperors' own inscriptions and by the Hellenic historian Herodotus were authenticated by the remarkable closeness of the approximation to agreement between a contemporary and an all but contemporary source, and he had then to read Theodor Nöldeke's *Das Iranische Nationalepos*² in order fully to realize just how little his reading of the pre-Sasanian chapters of Benjamin's *Persia* had added to the knowledge of historical facts that he had previously gained from reading Ragozin's *Media, Babylon, and Persia*. He eventually came to see that Benjamin—down to the point where he had drawn abreast of Herodotus and had there clumsily swapped horses in mid-stream of Persian history—had been riding the latter-day Muslim New Persian poets Daqiqi (*obit* A.D. 952) and Firdawsī (*vivebat circa* A.D. 932–1020/1), and that the written sources on which Firdawsī had drawn exclusively³ had been translations, made into New Persian in Khurāsān in the tenth century of the Christian Era, of Pahlawī prose versions of a corpus of Iranian epic poetry⁴ in which the true facts of Iranian history had been transmuted out of all recognition⁵ as the result of the operation of a law of literary evolution which constrains an artistically promising story to develop on lines, not of maximum fidelity to historical truth, but of maximum accommodation to literary expediency.⁶

The Rustem cycle of legends, which looms so large in Firdawsī's legendary history of Iran because the richness of this lode of literary ore attracted the genius of a great poet, proves, under Nöldeke's scientific assay, to have been a piece of local colour from Seistan and Zābulistān which may have been deposited in those two East Iranian provinces by Saka invaders in the second century B.C.⁷ In the miscellaneous assemblage of garbled history and rationalized myth from which the Iranian national epic had been concocted in the Sasanian Age, the ingredient that was most conspicuous by its absence was the Achaemenian episode of authentic Iranian history; for, after the overthrow of the Achaemenian Empire by Alexander the Great, almost all recollection of the Achaemenidae had dropped out of the Iranian peoples' folk-memory, and, of the few stray references to these Iranian empire-builders that are to be found in the Iranian national epic,⁸ some, at least,⁹ prove to

have found their way into it through translations of the Alexander Romance.¹

In April 1899, more than fifty-three years before the date at which this chapter was sent to press, these considerations were, of course, far above the head of a child trying to understand History; but, under the intellectual shock that he had suffered from stumbling upon a discrepancy which he had not found himself able to reconcile, the child had taken the point that 'authorities' could discredit themselves by disagreeing with one another, and this disconcerting discovery had been for him the painful beginning of historical wisdom,² inasmuch as it had taught him that 'authorities' were not to be taken at their word as if they were infallible oracles of gospel truth.

A year or so later the same boy was to suffer another shock of the kind from the detection of a tell-tale loose end in a chronological chart of Oecumenical History that was pinned up one day along two walls of the largest class-room in the preparatory boarding school—Wootton Court, near Canterbury—to which he had been sent in his eleventh year. At his previous day-school—Warwick House, adjoining the Regent's Canal, in London—a reading of the tenth chapter of the Book of Genesis had opened his mind to the fascinating and inspiring truth that Mankind was all one family, and History all one story; and, when he had begun to play his subsequent game of locating the descendants of Shem, Ham, and Japhet on the map and identifying them with extant or extinct divisions and subdivisions of the Human Race, he had found, in the maps included in 'the Queen's Printers' Aids to the Student of the Holy Bible', data that had enabled him to people the *Oikoumenê* with the descendants of Noah as far afield from their centre of dispersion in the South-West Asian 'fertile crescent' as the western basin of the Mediterranean in one direction and Central Iran in another. For the moment, he had not looked farther; but the posting of the chart in the schoolroom suddenly confronted him with a problem that had hitherto escaped him.

Looking first at the beginning of the chart, he had been struck by the preciseness of the date 4004 B.C. that was here assigned to the year of the Creation.³ Walking across from there to the far corner of the room, where the chart broke off at some date within the nineteenth century of the Christian Era, he noticed here, among the bands of various colours, representing the histories of divers peoples and states, one conspicuously broad band labelled 'China'. Were the Chinese descended from Shem, from Ham, or from Japhet? It had not occurred to him to ask the question before, but now it was going to be answered for him out of hand; for he had just ascertained that the chart began, at the opposite end, with the creation of the two parents of the Human Race, and he had now only to follow 'China' back in order to discover which of Noah's three

¹ The Alexander Romance went through an evolution that is a romance in itself (see V. vi. 440-4.) ² Prov. ix. 10.

³ This dating of the Creation was, of course, (see XI. ix. 178), the sign manual of Archbishop Ussher; and it therefore seems likely that his *Annales Veteris et Novi Testamenti* (London 1650-4, Fleisher, 2 vols.) was the original source from which this chart had been derived.

sons it was through whom the Chinese went back to Adam and Eve. Verification should be easy, since the snakelike band labelled China was of a python's girth; and, sure enough, the young investigator's finger traced this continuous ribbon of colour back into the second millennium B.C. But his hair stood on end when, at this point in his moving finger's backward journey, the three-thousand-years-long Chinese dragon's solid body suddenly broke off without linking up with either Japhet, Ham, or Shem—as if, more than a thousand years after the date of disembarkation from Noah's ark, four hundred million Chinese had been conjured up out of nowhere by an act of spontaneous generation. The workmanship of the draftsman of this at first glance imposing chart had, in fact, proved, on inspection, to be as shoddy as the performance of a plumber who, later on, was to instal a bath for a grown-up historian-householder without taking the trouble to connect the overflow-outlet with the waste-pipe.

This damning analogy did not occur to a child who, in A.D. 1899, was still living in an age of English history in which middle-class households were not yet encumbered with bathrooms; but he did realize at once that the Ussherite cartographers stood convicted of a culpable neglect—or perhaps, worse still, of a sheer inability—to trace back to the fruitfulness and multiplication of Noah and his sons¹ the latter-day diversity-in-unity of a Mankind that had duly replenished the Earth; and this shocking discovery raised in a would-be historian's mind his first doubt as to whether a genealogical tree was a vehicle that could effectively convey the history of the progressive differentiation of the Human Family.

As this doubt persisted and grew stronger, the writer experimented with alternative systems of classification which might perhaps comprehend all the living and extinct branches of Mankind and might at the same time account for all the gradations of diversity and affinity between them. Could the key to this historical puzzle be found in Physical Race if a mythical criterion of racial relations in the shape of a Biblical genealogy were discarded in favour of a 'scientific' criterion compounded of such objective and measurable data as the colour of the skin, the texture of the hair, 'the cephalic index', and the facial angle? Or, alternatively, could the key be found in language if a myth of the confusion of tongues at the abortive building of a Tower of Babel² were discarded in favour of the findings of the Late Modern Western science of Comparative Philology? After the writer's critical faculty had thus been set to work upon the problem of Mankind's diversity-in-unity thanks to the shock administered to his mind by an Ussherian chart of Occumenical History in A.D. 1899, it took him some ten or twelve years to arrive at the conclusion that the linguistic and the racial approach to the problem were each as unsatisfactory³ as the genealogical approach had previously proved to be. It was only after this thrice-repeated preliminary negative process of drawing blank that the writer was able to clear the ground in his own mind for the positive solution proposed in the present Study, in which he has argued that, in human affairs, the significant differences

¹ Gen. ix. 1 and 7.

² Gen. xi. 1-9.

³ A critique of the racial approach will be found in II. 1, 207-49.

and likenesses are not those of Race or Language, but are those of religious and secular Culture.

Another illuminating discrepancy impinged on the writer's mind one afternoon during the First World War when, as he was wandering through the Victoria and Albert Museum in South Kensington, his eye was caught by the bust of a girl in majolica in the naturalistic Modern Western style, and his curiosity was moved to ascertain the provenance and date of this attractive work of art. He was not surprised to find that a work as beautiful as this had been made in Italy, but he was astonished to discover that a work as modern as this had been made in the fourteenth century of the Christian Era. This bust was a piece of material evidence that, in the fourteenth century, Italy had already been living in the Modern Age of Western history; but in the rest of Western Christendom, with the possible exception of Flanders, the Modern Age had not dawned before the close of the fifteenth century or even the opening of the sixteenth. So Italy had been 'modern' already for perhaps as long as two hundred years before the rest of Western Christendom had followed suit to her; and this example proved that, within the bosom of one and the same society, it was possible for different 'sections' (in the 'geo-cultural' sense in which this word was used in the United States) to be historically out of step with one another. People who were chronological contemporaries might, in fact, be living side by side in two different cultural epochs.

This inference from the modernity of a fourteenth-century Italian bust was confirmed in the writer's mind when, some thirty years later, at the end of the Second World War, he paid another visit to the same museum in order to see on exhibition there the statues and other decorations from the English King Henry VII's chapel at Westminster Abbey. On this occasion he was able to appraise at close quarters the extent of the cultural gulf between the still inviolate Medieval Western style of the English work and the resurgent Hellenic style of the contemporary work of the imported Italian master Torrigiani.¹ This visual evidence of the temporary cultural precocity of Northern and Central Italy in a Late Medieval Age of Western history was one of the signals that drew the writer's attention to the historical role of creative minorities.

Light can also be thrown on History by critical reactions to discrepancies that have merely been suspected without having been verified. In September 1952 the writer could remember a day in March 1899 when his Mother was reading aloud to him Z. A. Ragozin's *Chaldea*² in *The Story of the Nations* series. Nineteenth-century Western Assyriologists and Egyptologists had been impressed by the length of their new vista of past history, by comparison with the relative shortness of the Biblical vista, much more forcibly than they had been impressed by the shortness of the Biblical and archaeological vistas alike by comparison

¹ This contrast has been noticed already in X. ix. 83.

² Fifth edition: London 1896, Fisher Unwin. This volume was the prolegomena to the same author's *Assyria*, which had already come into the present writer's hands (see p. 18, above). A curiosity to explore the antecedents of Assyrian history had moved him for the first time to spend his pocket-money on buying a learned work in preference to a box of lead soldiers.

with the relative length of the geological and astronomical vistas that were being opened up simultaneously by contemporary Western physical scientists; and consequently the antiquity of the 'Chaldean' (i.e. the Sumeric) Civilization was one of the principal themes of Ragozin's stimulating *œuvre de vulgarisation*. In expounding her thesis, the gifted authoress cited two by then already rediscovered chronological assertions that had been made by the Assyrian King Asshurbanipal (*regnabat* 660–626 B.C.) and by the Neo-Babylonian Emperor Nabonidus (*imperabat* 556–539 B.C.) without questioning whether these latter-day sovereigns' historical advisers had really possessed authentic information warranting their confidently presented figures. On Asshurbanipal's figure of 1,635 years for the length of the time that had elapsed since a statue of the goddess 'Nana',¹ which Asshurbanipal had brought back to Uruk (Erech) from Susa in 645 B.C., had been carried away into an Elamite captivity, her comment² was that '1,635 added to 645 make 2,280, a date not to be disputed'; and, though she boggled³ at the antiquity of the date—3750 B.C.—which was assigned to the *floruit* of the Akkadian war-lord Naramsin by Nabonidus's statement that Naramsin had reigned 3,200 years before Nabonidus's own day, she took refuge here in 'the possibility of an error of the engraver' of the inscription, without considering the alternative possibility that the latter-day emperor-archaeologist himself might have been drawing the long bow in the dark and might therefore perhaps not deserve to be taken *au pied de la lettre*.

Ragozin's unquestioning assumption that Nabonidus and Asshurbanipal had known what they were talking about was, of course, accepted by the listening child uncritically, but it suddenly occurred to him to wonder how the authoress knew that these Assyrian and Babylonian 'years' were periods of the same length as the familiar years in which time was reckoned in a nineteenth-century England, and he interrupted his Mother's reading by putting this question to her. Perhaps the question had been evoked in his mind by some echo of a nineteenth-century 'fundamentalist' Western Christian attempt to salvage the veracity of the Book of Genesis by suggesting that the 'years' of life attributed there, in generous hundreds, to the Patriarchs were in reality periods that would read, not as 'years', but possibly as 'months', if the chronological terminology of the Bible were to be translated into current parlance with a pedantic precision. Probably, if he had been country-bred, he would never have entertained the idea that there could be any such arbitrary variations in the length of the year, considering that its span was settled for the farmer, not by human fiat, but by a cycle of the seasons that invariably came round in the same course within the same period, whatever the human calendar-makers might choose to say. As, however, the child happened to be town-bred, he was blind to Nature's visual clock on whose face the fixed spans of the revolving and recurring seasons were registered by the regular alternation of the spring of the blossom and the fall of the leaf. In his cockney *Weltanschauung* in his tenth year,

¹ i.e. Inanna, the original Sumerian name of the goddess whose Akkadian name was Ishtar. The Sumerian 'Nanna' was not a goddess but a god—the moon-god whose Akkadian name was Sin.

² In op. cit., on p. 195.

³ Ibid., pp. 211–15.

'years' presented themselves as artificial spans of Time which human beings could expand or contract at will because human wills were presumed to have created them arbitrarily *ex nihilo*.

The naïve questioner lived to laugh at his childish ignorance, and then lived on to discover that his question had been shrewder than his wit. He had no sooner been sent to school in the country than he became aware of Nature's solar year, and he had no sooner followed up Arthur Gilman's *The Saracens*¹ in *The Story of the Nations* series by getting hold of Stanley Lane-Poole's *Mohammadan Dynasties*² than he discovered that Nature's clock displayed more than one dial, and that, where, as in this instance, Nature was at variance with herself, human wills were consequently invested with at least the limited freedom of choosing which dial to follow. The calendar of Babylonian origin that was current in an English boy's world at the turn of the nineteenth and twentieth centuries of the Christian Era was based on the solar cycle of the seasons, and, in the course of centuries, it had been readjusted several times over to coincide with this cycle with an ever closer approximation to exactitude—leaving the lunar cycle of the months to take care of itself, as best it could, by submitting perforce to a Procrustean process of arbitrarily stretching or docking the lengths of the months in order to fit them into a paramount solar framework. The English boy now made the discovery that the method of calendrical reckoning that happened to be current in Christendom was not the universal way of the World; for here, in current use in the Muslim quarter of the *Oikoumenê*, was a calendar—based, not on the solar, but on the lunar cycle—whose nominal 'year' of literally lunar months, ignoring the recurrent procession of the seasons, allowed itself to fall short of the true solar year's full measure, with the result that, as the tale of Islamic 'years' had mounted up from the initial date of the Era of the *Hijrah*, these *soi-disant* 'years' had been travelling time and again round the face of Christendom's Babylonian solar clock.

It was not, however, until A.D. 1950, when he was making his preparations for writing the note on Chronology printed in this Study in the present volume,³ that the writer realized the full bearing of an Islamic lunar calendar upon the question regarding the length of the Sumerian year which he had put to his Mother more than fifty solar years back. At Princeton, New Jersey, in the fall of the solar year A.D. 1950, he first read Poebel's articles⁴ on the recently rediscovered Assyrian King-List from Khorsabad and marvelled at the ingenuity of this accomplished contemporary Assyriologist's ways and means of harmonizing with this list the chronological assertions of two latter-day sovereigns—in this case, not Nabonidus and Assurbanipal, but Esarhaddon (*regnabat* 680–669 B.C.) and Shalmaneser I (*regnabat* 1272–1243 B.C. according to Poebel's dating).⁵ He then went on to read Sidney Smith's critique⁶ of

¹ London 1887, Fisher Unwin.

⁵ See *J.N.E.S.*, vol. i, pp. 290–5.

⁶ Smith, Sidney: 'Middle Minoan I–II and Babylonian Chronology', in the *American Journal of Archaeology*, vol. xlix, No. 1 (Concord, N.H. 1945), pp. 1–24.

Poebel's reconstruction of Assyrian chronology and was astonished to find one eminent contemporary professional archaeologist here putting to a confrère the very question that the writer himself, as a child, had once put to his Mother: How could one be sure that the 'years' in which the Assyrian chronologists reckoned were solar years or, indeed, even would-be approximations to them?

This hypothetical correspondence, which Poebel had tacitly taken for granted throughout his own reconstruction of Assyrian chronology from the recently discovered Khorsabad King-List in combination with the rest of the evidence, was roundly challenged by his distinguished adversary. In Assyria, Sidney Smith submitted,¹ the Babylonian solar calendar, which had arrived at a close approximation to the true solar year, did not appear to have been adopted for official use before the reign of Tiglath-Pileser I (*regnabat* 1114-1076 B.C.). 'Over a long period of years that calendar remains equivalent to Julian years in reckoning. . . . But the Assyrian calendar previously in use shows considerable variations from the Babylonian, and no precision in converting Assyrian years into Julian reckoning is possible.' In the non-Babylonian calendar current in Assyria before Tiglath-Pileser I's day there may have been a different and inferior system of intercalation; 'but the known facts at present favour the view that there was no intercalation at all'; and 'this is an important factor in calculating early dates'.² Sidney Smith suggests³ that the calendar which, in his belief, had been discarded in Assyria in 1114 B.C. in favour of the Babylonian solar calendar of the day, had been a lunar one—i.e. one constructed on the same basis as the calendar which, 1,736 years after the date at which it may have been abandoned in an Assyria that lay next to the heart of the Babylonian World, was still in use in the remote and backward Arabian oasis of Mecca, and which then, through the accident of its survival in this insulated desert-girt fastness, was to have its fortune made for it by automatically becoming the official calendar of a new oecumenical church founded by a Meccan prophet.

This controversy between Sidney Smith and Poebel, in which these two champion Assyriologists were hurling lunar and solar calendars at one another as Hector and Ajax had once hurled boulders, demonstrated that a critical reaction even to a disputable discrepancy might play an important role in a debate involving an entire scheme of chronology for the history of the Sumeric Civilization.

(II) CREATIVE RESPONSES

(a) MINUSCULA

If the observation, or even the unverified suspicion, of discrepancies between historical facts may inspire human minds to take intellectual action by arousing a negative critical faculty, we may expect, *a fortiori*, to see minds moved to act by the observation, or even by the unverified in-

¹ Smith, Sidney, *ibid.*, p. 19.

² *Ibid.*, p. 19.

³ See *ibid.*, pp. 22-23. This suggestion was rejected by some contemporary scholars (see the Note on Chronology, p. 177, below).

tuition, of connexions between historical facts which call for some positive explanation.

Rudimentary historical puzzles of this positive kind are set by the observation of the currency, at widely different points in Space and in Time, of identical elements of culture—identical clothes, for example, or identical words; for, however far apart from one another on the stage of History these identical elements may have made their successive separate epiphanies, a resemblance that approximates to identity is less likely to be a coincidence than to be due to some continuous chain of historical tradition and geographical diffusion which it may be possible to retrace.

How comes it, for example, that, on a bronze medal made in A.D. 1439 by the Italian master Vittore Pisano (Pisanello) for the East Roman Emperor John VII Palaiológhos (*imperabat* A.D. 1425–48), and in a fresco—painted on the west wall of the Church of San Francesco at Arezzo, at some date between A.D. 1452 and A.D. 1466,¹ by Piero della Francesca—in which the same John VII Palaiológhos is depicted in the role of Constantine the Great at the Battle of the Milvian Bridge,² this last but one of the occupants of a Byzantine imperial throne should be portrayed by two contemporary Italian witnesses³ as wearing a head-dress which looks uncommonly like the Egyptian Double Crown⁴—a

¹ For the date, see Clark, Kenneth: *Piero della Francesca* (London 1951, Phaidon Press), pp. 35–36.

² See the plates, in *op. cit.*, of the whole fresco (Plate 57), of the left-hand half of it depicting Constantine and his army (Plate 58), and of the head of Constantine (represented by John VII Palaiológhos) himself (Plate 62).

³ Warburg and others have supposed that Piero took the likeness of Palaeologus from Pisanello's medal of 1439, but this is not entirely true. The characteristic shapes and rhythms of the two heads are different... Piero, who had been living in Florence in A.D. 1439 when the Emperor John VII had come to Florence to attend the Church Council that had sat at Florence in that year, 'almost certainly saw Palaeologus with his own eyes' (Clark, *op. cit.*, p. 26, n. 1). In Piero della Francesca's picture of the Flagellation, at Urbino, which was probably painted in the fourteen-fifties, both John VII's countenance and his head-dress reappear, but here no longer in association with one another (see Clark, *op. cit.*, p. 19 and Plates 27–28).

⁴ The resemblance is particularly striking in Piero della Francesca's fresco, which brings out two points that are not apparent on Pisanello's medal (though, in the light of the fresco, the first point of the two can perhaps be detected on the finer of the two exemplars of the medal in the British Museum). The fresco shows that the two components of the head-dress were separate: the bottom edge of the conical inner component is just visible below the lower edge of the front portion of the outer component, which resembles the looped-up brim of an eighteenth-century Western three-cornered hat; and this detail is visible because the two components are of sharply different colours.

Since the plates of this fresco in Sir Kenneth Clark's book are not among those in which the original colours are reproduced, they reveal merely that the conical inner component of the imperial head-dress is relatively light in colour and that the looped-up outer component is relatively dark. In the original fresco, is the inner component white, as the conical crown of Upper Egypt was, and the outer component red—the colour of the looped-up crown of Lower Egypt? The answer to this question is given in the following sentence in a letter of the 6th October, 1952, from the Reverend Father P. Benedetto Renzi, Rector of the Church of San Francesco at Arezzo, in answer to an inquiry from the writer of this Study: 'I colori della corona di Costantino risultano bianco con sfumature rosse nella parte superiore, verde cupo nella parte inferiore.' The colouring here described by an eye-witness is faithfully reproduced in d'Ancona, Paolo: *Piero della Francesca: Il Ciclo Affrescato della Santa Croce nella Chiesa di S. Francesco in Arezzo* (Milan 1951, Pizzi), Plate XVI. The streaks of red do not come out in Longhi, Roberto: *Piero della Francesca: La Légende de la Croix (Fresques d'Arezzo)* (Milan 1952, Sidera; Paris 1952, Amiot-Dumont), Plates xxxi, xxxiv and xxxv.

It will be seen that, in the Emperor John VII Palaiológhos's head-dress as painted by Piero della Francesca, the Crown of Upper Egypt (if such it is) preserves its pristine

head-dress that had become part of the insignia of the Pharaohs after the political unification of Upper and Lower Egypt by Narmer *circa* 3100 B.C.¹ How could this complicated and outlandish headgear—which would look bizarre to anyone not acquainted with the crucial episode of Egyptiac history that it commemorated—have survived (if in truth it did survive) over a Time-span of more than four and a half millennia in order to make its eventual reappearance, not on the banks of the Nile where it had been invented, but on the alien shores of the Bosphorus at least a thousand years after the last remnants of a living Egyptiac tradition had become extinct in what had once been an Egyptiac World? An historian's mind in search of an answer to this question would recollect that the pre-Christian Roman Emperors had acted on their pretension to be the Pharaohs' legitimate successors by having themselves portrayed, on the monuments of the latest age of Egyptiac history, as wearing the Pharaohs' traditional insignia. Would it be too fanciful to imagine that these Roman impersonators of Egyptiac Pharaohs may have provided themselves with actual sets of the Pharaonic insignia, including the symbolic Double Crown, and that, in spite of the subsequent extinction of the Egyptiac culture and the eventual loss of Egypt itself by the Christian Roman Empire to its Primitive Muslim Arab invaders, these long-since obsolete Egyptiac regalia may first have been transferred from the Old Rome to the New Rome and afterwards been preserved there in the office of the Protovestiaris of an extinct Roman Empire's East Roman ghost till the last of the Palaiológis came across them in some imperial lumber room and took the fancy to wear them—probably without being aware of either their origin or their significance.

How comes it, too (to pursue this fascinating subject of the diffusion of headgear),² that the brimless 'stove-pipe' hat (*Persicè* 'taka'), curving outwards towards its flat crown, in which the Persian guardsmen are portrayed on Achaemenian bas-reliefs, and in which Baluchi shepherds were still to be seen stalking over the highlands of South-Eastern Iran at the time of writing,³ should have been in academic use in twentieth-

white with a taint of Lower Egypt's red, but that the Crown of Lower Egypt (if such it is) has changed its hue from red to bottle-green.

The same head-dress, in the same colours, has been placed by the same painter on Pilate's head in his picture of the Flagellation in the Ducal Palace at Urbino. In a letter of the 30th October, 1952, in answer to an inquiry from the writer of this Study, Signor Pietro Zampetti, Soprintendente alle Gallerie delle Marche, notes that this head-dress 'comes close, in its shape, to the beret of the "Clerici Vagantes", but might also be reminiscent of the ancient crown of Egypt—though it is distinguished from this by the cut of its peak, which is strongly pronounced.' 'Per quanto riguarda i colori, essi sono il rosato per la parte interna del copricapo ed il verde scuro per quella esterna. La striscia bianca dovrebbe essere cosa a sè, specie di fascia che si nota anche in altra figura dello stesso dipinto.'

The resemblance of Pilate's head-dress, in this picture, to the Crown of Lower Egypt is noticed by Longhi in his *Piero della Francesca* (Rome 1927, p. 41: 'Pilato si effigia faraonico.')

¹ See II. ii. 112 and 114-15, and IV. iv. 502-4.

² Two illustrations of it have already been noticed in this Study in other contexts: the derivation of the nineteenth-century Western 'top hat' from the sixteenth-century Western steeple-crowned hat in III. iii. 136, with n. 2, and the derivation of 'the cardinal's hat' from the shield-shaped or mushroom-shaped headgear of the Achaemenian Empire's subjects in the Aegean Archipelago in VI. vii. 681-2.

³ See VI. vii. 681.

century English-speaking countries in the recognizably derivative shape of the 'college cap' or 'mortar-board'? The last link but one in the lost chain of transmission could readily be detected in the 'toque' worn by members of the legal profession in France; but from whom had this headgear been borrowed by these French representatives of one of the liberal professions of Western Christendom? From the Ottoman grandees who, before the revolutionary substitution of an egalitarian fez by Sultan Mahmūd II (*imperabat* A.D. 1808-39), had worn the Achaemenian 'taka' wrapped in a voluminous turban? Or from the priests of the Eastern Orthodox Christian Church in *partibus Ottomanicis*, on whom a plain black variant of this Persian headgear had been imposed by their Muslim masters? Or from the uhlans¹ whose Turkish appellation testifies that their accoutrements must have been introduced into Poland from Turkey on their way to becoming acclimatized in Prussia?

What, again, was the line of descent by which the hood that was associated with cap and gown in the academic costume of twentieth-century English-speaking countries had been derived from the 'hood' that, in the Achaemenian Emperor Darius I's bas-relief carved on the face of the cliff at Behistan before the close of the sixth century B.C., draws the eye to the last of the figures in the file of vanquished rebel leaders who are being brought to judgement before the face of their puissant subjugator? It is true that the enormously high pointed cap that the Massagetan Saka chieftain Skunkha is here portrayed as wearing bears slightly more resemblance to Little Red Ridinghood's headgear than it bears to the glorified scarf that twentieth-century Anglo-Saxon doctors and bachelors of Theology, Law, Arts, and Science wore slung over their shoulders; yet the identity of the name attests the historical connexion; for, in virtue of their distinctively peculiar headgear, the Massagetae were nicknamed by their Persian conquerors 'the Pointed-Hood Saka' (Sakā Tigrakhaudā). What were the successive stages in the subsequent metamorphosis of Skunkha's headgear?

Anyone contemplating Skunkha's 'pointed hood' in a photograph of Darius's bas-relief could predict that sooner or later its point would sag either forwards or backwards; and there was evidence to show that both these alternative possible variations in the fashion of wearing this preposterous Massagetan headgear were subsequently tried. At the time of writing, the forward-curving variant was to be seen in the Panjab in the horn-shaped cap of stiff dark blue felt round which the Sikh akalis wore their ring-shaped war-quoits, and in the flabbier headgear of the same shape that was part of the insignia of a Neapolitan Pulcinello, while the backward-curving variant was the Medieval Western *liripipium*—still familiar to Modern Western eyes in busts and portraits of Dante—whose point, transformed from a stiff felt steeple into a soft cloth pigtail hanging down between the shoulder-blades, had once captivated the male half of the population of the whole of a fourteenth-century Western Christendom, from Florence to Greenland.²

¹ *Turcicē* 'oghlanlar', meaning 'the boys'.

² The Norse settlers in Greenland, whose losing struggle for survival ended in their extinction round about the turn of the fifteenth and sixteenth centuries, continued (see Nørlund, P.: *Viking Settlers in Greenland and their Descendants during Five Hundred*

The survival of the forward-pointing variant of the Massagetan 'hood' in the Panjab was, of course, easily explained. It had been carried from the Oxus-Jaxartes Basin into the Indus Basin by the Massagetae themselves, together with their tribal name (the Jāts), in their *Völkerwanderung* in the second century B.C. It was not so easy to account for the epiphany of the self-same variant of the pointed hood on Pulcinello's head at Naples; yet an historian might hazard the guess that its carriers from Central Asia to Southern Italy might have been Alzece's war-band of Bulgar Hun Turkish-speaking Eurasian Nomads who were passed on by Grimwald King of the Lombards (*regnabat* A.D. 662-671) to his son Romwald Duke of Benevento, and were then planted by Romwald in the depopulated territories of Bovianum, Saepinum, Aesernia, and other decayed city-states¹ in the district of Northern Samnium that afterwards came to be known as the Molise.² 'It seems probable that this settlement of the Bulgarians was partly a measure of precaution against attack from Rome or Naples';³ and, if so, it might also seem not improbable that the Roman united empire loyalists who had continued, after the irruption of the Lombards, to hold bridgeheads at Naples and Gaeta and in the Ducatus Romanus for an Imperial Government at Constantinople should have given visual expression to their scorn and detestation of the Eurasian Nomad horde which the Lombard usurpers had now planted next door to them by clapping these ex-Nomads' distinctively outlandish 'pointed hood' upon the head of a puppet representing the arch-villain Pontius Pilate in a perfunctorily Christianized *Fabula Atellana*.

Though there is no evidence that the Bulgars' Hun ancestors had, in fact, picked up the Massagetan 'pointed hood' *en route* from Mongolia to the Great Western Bay of the Eurasian Steppe, it seems just possible that our Parthian shot in the dark may have hit the mark; but whence did Dante acquire his *liripipium*? What was the missing link here between the backward-trailing hood worn by a Florentine poet born in A.D. 1265 and a tendency towards a backward-curving fashion of wearing the Massagetan 'pointed hood' that was revealed in the extant works of art of an Achaemenian Empire that had been overthrown in 334-330 B.C.?

Years (London 1936, Cambridge University Press), pp. 110-11 and 126), to the last, to follow the latest fashions of a Western Christendom into which an abortive pagan Scandinavian Society had been absorbed at the turn of the tenth and eleventh centuries (see II. ii. 340-60). Among other articles of Medieval Western Christian dress the Greenlanders adopted the fourteenth-century *liripipium* (see Nørlund, *op. cit.*, pp. 118-25); and the seventeen specimens (see *ibid.*, p. 118) that had been recovered by Modern Western archaeologists among the clothing excavated from the graves in the churchyard at Herjolfsnes were probably (see *ibid.*, pp. 123-4) the only representatives of the *liripipium* that were extant at the time of writing.

¹ See Paulus Diaconus: *Historia Langobardorum*, Book V, chap. 29. The historian, writing, as far as can be ascertained, at some date between A.D. 786 and 795, records of Alzece's Bulgars that, 'usque hodie in his, ut diximus, locis habitantes, quamquam et Latine loquantur, linguae tamen propriae usum minime amiserunt'.

² This district was found desolate by Strabo (see his *Geographica*, Book V, chap. iv, § 11 (C 249-50), cited in IV. iv. 391, n. 2, and in V. v. 37, n. 2), not much less than a hundred years after its devastation in 81-80 B.C. by Sulla. The writer is not aware of any evidence that it had ever been resettled before Alzece's Bulgars were planted there three-quarters of a millennium after the commission of Sulla's atrocity.

³ Hodgkin, T.: *Italy and Her Invaders*, vol. vi (Oxford 1895, Clarendon Press), p. 284, n. 1.

Here again, a clue might be found by the historian in one of the periodic eruptions of the Nomads out of the Eurasian Steppe. In A.D. 1241 the unprecedentedly violent eruption of the Mongols out of the heart of the Steppe had sent the Cuman Turkish Nomads flying out of the Steppe's Great Western Bay into the detached enclave of steppe-land in the Hungarian Alföld, with the Mongols themselves following at the Cumans' heels. The Cumans had burst into Hungary as pagan barbarians, and such they might have remained if their Mongol pursuers had stayed there with them. But the wave of Mongol invasion had receded from Hungary as rapidly as it had swept over it, and, when once the Mongols were out of the way, the Magyars, who knew how to handle Nomads in virtue of being *ci-devant* Nomads themselves, had managed to convert the manageably small intrusive horde of Cuman strangers in their midst to the Western Christian religion and culture to which the Cumans' Magyar hosts had been converted a quarter of a millennium earlier.¹ Through the agency of Western Christendom's Magyar marchmen over against the Eurasian Steppe, the Cuman refugees in the Alföld had thus been brought into the fold of Western Christendom in the course of the second half of the thirteenth century of the Christian Era;² and it does not seem unduly fanciful to conjecture that they left a monument of their conversion in the subsequent captivation of the Western Christian World, into which these Eurasian Nomad immigrants had thus made their entry, by the backward-curving variant of the Massagetan 'pointed hood' in the *outré* form of the *liripipium*.³

We cannot take our eyes off Skunkha's steeple-shaped 'hood' without being moved to ask the further question whether this extraordinary headgear was an invention of the Massagetae's own, or whether it is not more likely that they had borrowed it from Anatolia, where the antiquity of its vogue is attested by its appearance on the heads of the warriors on the frieze in the Hittite sanctum at Yazly Qaya, over against the Hittite capital city on Boghazqal'eh, while the persistence of its vogue there—latterly in the service, not of War, but of Religion—is attested by its retention as part of the insignia of the Islamic religious orders in Anatolia down to their dissolution on the 2nd September, 1925, by the fiat of the government of a Westernizing Turkish Republic. These orgiastic worshippers of the One True God are convicted by their headgear of having been the spiritual heirs of those orgiastic worshippers of the goddess Cybele who were nicknamed Corybantes ('High-Hats') by Hellenic observers. Was Anatolia the original centre of dispersion of 'the pointed hood' in the pristine form in which it appears on the head of the Massagetan chief Skunkha in the sixth century B.C. and on the heads of witches, astrologers, heretics, and dunces in Western Christendom?

Whatever its original provenance may have been, the Massagetan 'pointed hood' was in any case not the Eurasian Nomads' normal headgear. The common run of Eurasian Nomad peoples wore 'the Phrygian cap' in which the Scyths are portrayed in Hellenic and Helleno-Scythian works of art made in the fifth and fourth centuries B.C., and which is likewise

¹ See III. iii. 426.

² See III. iii. 461.

³ Was the Ottoman Janissaries' headgear a variant of the *liripipium* which had been slung into Anatolia by the same Mongol eruption in Eurasia?

the headgear in which Dacians, colliding with the Romans four or five hundred years after the Scythians' *floruit*, are depicted on Trajan's Column. In bringing this standard Eurasian Nomad headgear on to our stage, we have anticipated the answer to another question: How comes it that the official head-dress of the Doge of Venice, familiar to frequenters of the National Gallery in London in Giovanni Bellini's portrait of the Doge Leonardo Loredano (*ducebat* A.D. 1501-21), is identical with that displayed in clay figurines representing officials in the service of the T'ang Dynasty (*imperabant* A.D. 618-907) in a Far Eastern World that lay on the other side of the Eurasian Steppe from Western Christendom? The link becomes manifest when we realize that this Veneto-Chinese official headgear is the Eurasian Nomad's standard soft 'Phrygian cap' frozen stiff; and it is not difficult to understand how this came to be part of the insignia of public office in Northern China, considering that the Nomads had been politically dominant there for more than three hundred years before the T'ang régime was established with its headquarters within this domain that the Nomads had carved out for themselves in *partibus Sinarum*.¹ Presumably the same official headgear was picked up by the Venetians from one or other of the successive hordes of Nomads—Sarmatians, Huns, Bulgars, Pseudo-Avars, and Magyars—who repeatedly raided the plains of Northern Italy in the courses of the post-Theodosian and the post-Carolingian Völkerwanderungen.²

Nor was it only the headgear of the Eurasian Nomads that found its way into Western Christendom; for the historic accoutrements of the Scyths and the Dacians, as these are portrayed in Hellenic works of art, reappear, *cap-à-pie*, in the garb in which a mythical race of Dwarfs was subsequently clothed in a Western folk-lore. These Dwarfs were, of course, *numina*—projected by the Subconscious Psyche in response to the mind's challenging experience of extracting metallic treasure from the bowels of the Earth—who never had any existence in what the Conscious Psyche calls 'real life'; but the costume in which the Dwarfs made their epiphany in Fairyland must have been the authentic dress of some living people of flesh and blood who were encountered by the pioneers of a Medieval Western Christendom's eastward expansion overland. If we

¹ See X. ix. 651-2.

² See, however, Zanetti, G., in his dissertation *Della Berretta Ducale, Volgarmente Chiamata Corno, che portasi da' Serenissimi Dogi di Venezia* (1779), to which the writer's attention was drawn by Mr. James Laver, the Keeper of the Departments of Engraving, Illustration, and Design, and of Paintings at the Victoria and Albert Museum in London. Zanetti argues that the modern form of the Doge's official head-dress was not the result of a single change, but was the recent result of a six or seven hundred years long process of evolution. He claims to have identified nine stages (illustrated at the end of the booklet). The current name *corno*—alluding to the point to which the Doge's cap, in its modern shape, rose at the back—could not be traced back earlier than the sixteenth century, in Zanetti's belief (*ibid.*, pp. xviii-xix). Zanetti finds the origin of the modern *corno* in a conical cap worn by dogi in representations of them in the oldest mosaics in St. Mark's (*ibid.*, p. v). He suggests (*ibid.*, pp. xix-xxi) that this conical cap was a Teutonic barbarian Transalpine headgear which was adopted by the Venetian dogi and was then progressively modified at Venice until it eventually arrived at its modern style. After following Zanetti's arguments and examining his illustrations, the writer of this Study did not find himself convinced that the T'ang-like *corno* and the Carolingian-like conical *berretta* were in truth successive stages in the evolution of one and the same cap.

may also hazard a guess at the provenance of this lost tribe whose dress was thus immortalized by being taken as the model for the clothing of imaginary Dwarfs, we may picture to ourselves a band of Nomad herdsmen straying beyond the limits of their cattle ranges in the Great Western Bay of the Eurasian Steppe as they push their way up the valley of the Dniestr into the Galician forests; and we may go on to picture these stray stock-breeders finding themselves constrained, in a strange physical environment, to change their economic occupation by taking to mining. The historic prototypes of the mythical Dwarfs would then be a mining community in some secluded valley of the Carpathians or the Riesengebirge whose Nomad origin was still advertised in their ancestral dress at the time when the first aggressive Medieval German mineral prospectors arrived on the scene to put these *ci-devant* Nomad miners out of business.

The itch to find explanations for connexions between historical facts is, of course, excited by facts of other kinds besides identities in fashions of clothes. In the field of Language, for example, how had it come to pass that the vocabulary of a late-nineteenth-century middle-class English nursery included the name of the Sumeric goddess Inanna? The history of the translation of Inanna to an English nursery from a Sumerian temple was illuminated by her epiphany under her original name—none the worse for its long journey through Time and Space, save for the weathering away of its initial vowel—as the Nanna who, in the pagan pantheon of a post-Carolingian Scandinavian heroic age, was still being honoured as the consort of Balder, 'the Lord' who dies and rises from the dead. Though, in Scandinavia in the tenth century after Christ, the Norse version of the dying and rising god's traditional epithet has eclipsed this Sumeric god's proper name, Balder's identity with Tammuz, which is proclaimed in Balder's passion, is established by the tell-tale survival of the Sumerian proper name of a great Mother who is Tammuz-Balder's wife.¹ In a Victorian nursery, where the child's nurse meant more than its mother meant to the child, it was natural enough that the child should apply the name of this unforgettable Mother Goddess to the most puissant female figure within its miniature horizon.²

What, again, was the etymology of βασιλεύς, the Greek word for 'king', which was as enigmatic as it was familiar? *Kral*, the Slavonic word for 'king', was familiar without being enigmatic. The word *kral* was known to have originated in the coining of a common noun out of the proper name of an historical King Karl whose fame had made so wide and so deep and so lasting an impression on the imaginations of the Slavonic-speaking barbarians beyond the eastern borders of Charlemagne's empire that in all Slavonic dialects, from those of the adjacent Wends and Srbs to those of the distant Russians and Bulgarians, the Great Karl's

¹ See V. v. 150.

² The writer could remember how once in his nursery, when his nurse and his mother seemed to him to be annoyingly preoccupied with one another, he sought in vain to distract their attention to his mother's business, crawling under the bed, exclaiming, each time: 'Mother and Nanny are good; Mother and Nanny are God; I am hiding from God.' Without knowing it, he was playing at one of the principal cults of a Sumeric religion which, on the adult surface of life, had been extinct for some two thousand years in its native land of Shinar.

non-Slavonic personal name came, *par excellence*, to denote any holder of the royal office of which Karolus Magnus had been such a pre-eminent incumbent. On this analogy, might an inquirer hazard the guess that the Greek, like the Slavonic, word for 'king' had been derived from the foreign proper name of an historical king who had made a comparable impression on the imagination of the Achæan barbarians at the moment of their entry on to the stage of History? The Hittite counterpart of an Austrasian Karl was forthcoming in the person of Biyassiliš the son of Suppiluliuma, who was installed by his father as the Hittite sub-king of Carchemish,¹ commanding the right bank of the Euphrates at its western elbow, mid-way through the fourteenth century B.C., at just about the time when the Achæan pirates were making their first lodgements on the coasts of Pamphylia and Cyprus. Though Biyassiliš's reign at Carchemish was short, he won swift renown by invading Mitanni on his imperial father's behalf and reinstating there, as a Hittite puppet, Mattiwaza, a refugee claimant to the Mitannian throne.² It would be the less surprising to find that Biyassiliš had made his way into the Greek vocabulary, considering that Biyassiliš's brother, and Suppiluliuma's second successor on the Hittite imperial throne, Muršiliš II, who is known to have crossed the Achæans' path in Millawanda, certainly did make his way into Greek legend as Myrtilus, the tool and victim of the Anatolian adventurer Pelops, while a later Hittite emperor, Tutkhaliya IV, who likewise had dealings with the Achæans in Western Anatolia, figures in Greek legend as Deucalion, the survivor of the Flood.

The itch to find a link between two widely sundered yet patently identical historical terms—linguistic, sartorial, or whatnot—might still set a would-be historian's mind in motion when not only the connecting link but also one of the two terminals was missing. Who had been the ancestors of the Etruscans? Who were the descendants of the Lost Ten Tribes of Israel? There could have been few obscure peoples that had not been cast by some Hellenic or Modern Western antiquarian for the role of having been the Etruscans' progenitors; and there could have been still fewer ambitious and conceited peoples in the broad domains of Christendom and Islam that had not claimed to be the heirs of the Lost Tribes.

The fantastic history of these spurious claims was a warning that the potentially creative intellectual impulse to investigate the relations between historical facts might lose itself in a sandbed of folly; and a prudent adult historian would sternly restrict the ration of time and energy that he allowed his mind to devote to such unsolved, and perhaps insoluble, questions concerning the connexions between things that had fascinated him since childhood. Yet there were at least two grounds for seeing in these alluring curiosities of History something more than unprofitable trivialities. In the first place they might throw light on general historical questions of manifest importance. Our string of Plutarchan questions about the history of divers articles of dress brings out, for

¹ See Contenau, G.: *La Civilisation des Hittites* (Paris 1934, Payot), p. 95; Delaporte, L.: *Les Hittites* (Paris 1936, La Renaissance du Livre), p. 98; Cavaignac, E.: *Le Problème Hittite* (Paris 1936, Leroux), pp. 35 and 37.

² See Delaporte, op. cit., p. 108.

example, the interesting truth that the conductivity of the social fabric of human life is exceptionally high in two particular social milieux: in a 'universal state', such as the Achaemenian Empire or the Roman Empire, and in a Nomad pastoral society cruising on the waterless ocean of the Steppe. Our speculations about the provenance of a word in a Victorian English nursery vocabulary similarly bring out the truth that the radiational energy of elements of culture is exceptionally high when these elements are divinities. Such lights on the landscape of Oecumenical History, fitful though they might be, were nevertheless sufficiently illuminating in themselves to justify the exercise of the Intellect in investigating the connexions between facts that at first sight might appear trivial; but the main justification for this childish-looking intellectual pursuit was that it was pregnant with a question—'How did this come out of that? And how did that turn into this?'—which was at the heart of every adult historian's serious business on the intellectual plane.

In endeavouring to trace forwards and backwards the history of Skunkha's arresting 'pointed hood', a child's mind would be setting out on the Intellect's ultimate quest '*rerum cognoscere causas*';¹ and, in putting itself through a childish trial practice of this sovereign intellectual activity, the mind of a potential historian would be unconsciously preparing itself against the historic day when it might rise to the height of some great occasion for wresting from the Sphynx an answer to one of her more significant riddles.

(b) PAULO MAIORA

1. *Inspirations from Social Milieux*

Clarendon, Procopius, Josephus, Thucydides, Rhodes

'How has this come out of that?' If we set ourselves now to trace the genesis of some of the classic achievements of great historians, we shall find that this simple question has presented the challenge to which their mighty works have been the response. In making a survey of instances that are particularly instructive or particularly celebrated or both, we may find it convenient to examine first those cases in which the intellectual challenge has been presented by some public event, and then those in which it has been presented by some personal experience.

Since, in the histories of the civilizations down to the time of writing, wars had been the most frequent and most conspicuous agencies of social change at a pace fast enough to make the change perceptibly revolutionary even within the span of a single lifetime, it is not surprising to find that the intellectually inspiring elemental question 'How has this come out of that?' had often clothed itself in the form: 'How has this post-war state of affairs come out of that pre-war state?'

This question had suggested the subject for a classic historical work to Clarendon, Procopius, Josephus, Thucydides, and James Ford Rhodes; and, of these five great historians, the last-mentioned was perhaps the most remarkable witness to the strength of the inspiration that might be breathed into a potential historian's mind by the question how

¹ Virgil: *Georgics* II, l. 490.

the transit has come to be made from an ante-bellum dispensation to a post-bellum one that is strikingly unlike its predecessor, though it is separated from this previous dispensation chronologically by just a few alchemic war years.

Clarendon, after all, might have been expected to become the historian of the English Civil War of A.D. 1642-7; for, by the date of the outbreak of that war, Clarendon was already active and prominent in English parliamentary politics; as soon as war broke out, he became King Charles' principal adviser on legal and constitutional questions; and, before the war was over, he had risen to be one of the foremost statesmen in the Royalist camp. In short, the Civil War had been as great an event in its historian's personal life as in the public life of the nation that had been rent in twain by it. Procopius, the historian of the wars of Justinian, served in Belisarius's campaigns as the commander-in-chief's private secretary.¹ As for Josephus and Thucydides, the outbreak of the wars of which they eventually wrote histories found both of them of an age and social rank that qualified them for military service in commands of considerable responsibility, while Josephus's dramatic personal fortunes in the Great Romano-Jewish War of A.D. 66-70 gave him the advantage—ineestimably valuable for a future historian—of seeing the military conflict that was to be his subject first from the side of his Jewish compatriots and afterwards from the side of his Roman captors, thanks to the open-mindedness and perspicacity shown by Vespasian in employing his gifted Jewish prisoner-of-war as a confidential adviser on Jewish affairs.² It is not surprising that Thucydides, as he tells us in the first sentence of his history, should have foreseen, at the outbreak of the Atheno-Peloponnesian War of 431-404 B.C., that this was going to be, not merely a great war, but perhaps actually the most important of all wars that had yet been waged within Hellenic memory,³ or that Josephus,

¹ See Procopius's preface to *A History of the Wars of Justinian* (Book I, chap. 1).

² 'My own record of the war as a whole and of the incidental details is correct, since I was a first-hand witness of all the events. I was in command of our Galilaeans so long as resistance was possible, while after my capture I was a prisoner with the Romans. Vespasian and Titus compelled me to remain in constant attendance upon them under guard, at first in chains, "....." I was released and was sent from Alexandria, on Titus's staff, to the s "....." During this period there was no transaction that escaped my observation. The events in the Roman camp I sedulously recorded at first hand, while I was the only person present who could understand the reports of the deserters from the Jewish side. When all my material was in the proper state of preparation, I took advantage of a period of leisure at Rome to employ the services of collaborators to help me with the Greek language, and I thus wrote out my narrative.'—Josephus: *Preface to Contra Apionem* (Book I, chaps. 47-50).

³ 'Thucydides of Athens has written the history of the war between the Peloponnesians and the Athenians. He began to write as soon as war broke out, in the belief that this war would eclipse all its predecessors in importance. He drew this inference from the fact that both belligerents, when they started hostilities, had reached the highest degree of preparedness in every arm, while the rest of the Hellenic World was already taking sides—some countries intervening at once and others intending to follow their example. This war was, indeed, the greatest upheaval ever experienced by Hellas and by a part of the non-Hellenic World (it would hardly be an exaggeration to say: by the Human Race). It is true that the passage of time has rendered accurate research into the recent as well as the remote past impossible; but, in the light of the earliest evidence that I consider trustworthy, I do not imagine that the past has produced either wars or other events on an important scale.'—Thucydides: *A History of the Great Atheno-Peloponnesian War*, Book I, chap. 1.

At Princeton, New Jersey, on the 22nd February, 1947, the writer of this Study had the interesting experience of hearing Thucydides' high estimate of the importance of the

in the first sentence of his history likewise, should have claimed for the Romano-Jewish War of A.D. 66-70 in retrospect that it was 'the greatest war of our own times' and that it would hardly be an exaggeration to add that it was 'the greatest of any wars on record between either city-states or nations'.¹ By contrast, James Ford Rhodes was not merely remote from public life but was also still only a boy at the time of the war² that inspired him to carry out his intellectual life-work. The only direct personal connexion, known to the present writer, that Rhodes had with the great public events in the United States either during or immediately before or after the Civil War was his father's participation, as one of the Douglasite Democratic delegates from Ohio, in the Democratic Party's Convention at Charleston, South Carolina, on the 23rd April-1st May, 1860.³ Yet Rhodes' responsiveness to the intellectual challenge of the revolution in his country's life during his boyhood was apparently so vigorous that even in his schooldays, it is said, 'he had conceived the purpose of writing American history',⁴ while in his adult life he demonstrated the steadfastness of an already settled purpose by the patience with which he waited until A.D. 1887 before starting work on his grand historical design⁵ and by the persistence with which he then spent the next nineteen years (A.D. 1887-1906) in bringing *A History of the United States from the Compromise of 1850 down to the Final Restoration of Home Rule at the South in 1877*,⁶ and another sixteen years (A.D. 1906-22) after that in carrying the story on from A.D. 1877 to A.D. 1909.⁷

war of which he became the historian endorsed by a great living American soldier who had just taken on his shoulders the burden of the Secretaryship of State. In an address at Princeton on that date, in which he was impressing upon his audience the importance for the country of an enlightened public opinion that could co-operate intelligently with the Administration in the choice and execution of a national foreign policy, General Marshall suggested to them that one way of equipping themselves mentally for this contemporary political task would be to study the history of the Hellenic World during the generation ending in the outbreak of the War of 431-404 B.C.

¹ The intellectual advantage of a position in which he had a foot in both the contending camps and an insight into both the conflicting cultures inspired Josephus not merely to write a history of the war in which he had participated personally, in two successive different capacities, but also to publish an edition of his work in Greek as well as one in Aramaic. In his preface to *The Romano-Jewish War* (Book I, chaps. 1-16) he has recorded that his dissatisfaction with the histories of this war previously published [in Greek] 'has induced me to offer to the public of the Roman Empire, in a Greek translation, a work of my own, originally composed in my native [Aramaic] language and published in the non-Hellenic Orient. . . I felt it a paradox that the truth concerning events of such importance should be allowed to remain unsettled and that the Parthians, the Babylonians, the most remote populations of Arabia, my own compatriots beyond the Euphrates, and the inhabitants of Adiabênê should be accurately informed, through my labours, of the origin, vicissitudes, and issue of the war, while the Hellenes and all Romans who did not serve in the campaign should have nothing better at their disposal than flattering or fictitious accounts which conceal the truth.'

The wideness of the range of the currency of Aramaic as a *lingua franca* in the Syriac World of Josephus's day has been noticed in V. v. 487-91.

² Rhodes was born on the 1st May, 1848, so he was not yet thirteen years old on the 12th April, 1861, when fire was opened on Fort Sumter, and not yet seventeen years old on the 26th April, 1865, when Johnson signed with Sherman the definitive convention for the surrender of all Confederate forces still under arms.

The experience of living through a war—whether as a prominent participant in the catastrophe or as a sensitive spectator of it—was thus the inspiration of all these five historians, but it is also evident that the theme with which a war presented each of them was a revolution in human affairs which was of greater magnitude and significance than the military conflict by which it was signalized.

Clarendon's underlying theme is the decision, in the English Civil War, of a momentous controversy over the evolution of the traditional constitution of the kingdom;¹ and, though Clarendon may hold that this decision was the wrong one, and may hope that its ostensible reversal at the Restoration may prove to have been genuine and permanent, his belief in the importance of his constitutional theme is attested by his act of writing his history.

Rhodes' underlying theme is the discomfiture, registered in the defeat of the Confederacy in the American Civil War, of one section of the United States and province of the Western World of the day which had been alienated from the rest of an American Commonwealth and a Western Society by the fateful heritage of 'the peculiar institution' of Negro Slavery. In the American Civil War the slave-holding South failed to preserve by the *ultima ratio* of political secession a traditional social evil that, by this date, had been decisively condemned by the conscience of the Western World as a whole. In recording the political failure of eleven of the slave states included in the United States in 1861 to emulate the thirteen colonies that had revolted against the British Crown in A.D. 1775 by establishing a new sovereign independent confederation to house a nation struggling to be born, the historian is at the same time recording the social failure of a slave-holding branch of a Late Modern Western Society to emulate a city-state cosmos which had differentiated itself from the main body of Western Christendom in the Medieval chapter of Western history.

Thucydides' underlying subject is the larger one of the tragic breakdown of a promising civilization;² and an intuition of this theme, and recognition of its importance, were no doubt the considerations that led an American soldier-statesman, on the 22nd February, 1947, to exhort an audience composed of the faculty, students, and alumni of a great American university to study the antecedents of the war that Thucydides had immortalized.³

Josephus's underlying theme was an episode in the long-drawn-out encounter between the Syriac and the Hellenic Society in which a Palestinian Jewry, posted in the perilous front line of the Syriac order of battle, had been partly inflamed and partly intimidated by a Zealot minority into embarking on the forlorn hope of taking up arms against an Hellenic universal state.⁴

'The revolutionary element among the Jews, which was at its zenith both in funds and in forces, timed its rebellion to take advantage of the prevailing disorders. The consequent convulsions were so violent that the

⁴ See II. ii. 285-6; III. iii. 294-6; and V. v. 68 and 125-6.

fate of the East hung in the balance between the two belligerents, who had everything respectively to hope and to fear from the issue. The Jews hoped that the entire body of their compatriots beyond the Euphrates would join in their rising, while the Romans were harassed by attacks from their German neighbours, unrest among their Celtic subjects, and the world-wide convulsions that followed the death of Nero.¹

As for Procopius, his underlying subject is the rally, registered in Justinian's wars, of an Hellenic Society, embodied politically in a Roman Empire, after both the empire and the society had appeared to be moribund. The questions raised in Procopius's mind by this series of Roman military counter-offensives against the barbarian intruders on Roman territory are: 'How have the Romans managed to regain the upper hand? What have been the new military equipment and tactics through which they have won their victory?'² How has the Imperial Government acquired the resources for building churches as well as fortresses? And what is this revolutionary style of architecture in which Anthemius, in building the church of the *Ayía Sophía*,³ has vindicated the Justinianean rally of the Hellenic Civilization as signally as Belisarius has vindicated it by overthrowing the Vandals and the Ostrogoths? How, in short, has the Romania of Arcadius and Theodosius II (*imperabant* A.D. 395-450) become the Romania of Justinian (*imperabat* A.D. 527-65)? These were the questions that moved Procopius to write *The Wars of Justinian* and *Justinian's Public Works*;⁴ but the sixth-century Caesarean historian-barrister had not reached the end of his tether before the unhappy outcome of a reign that, on the surface, had looked so magnificent had raised a further question in Procopius's mind: 'Has not this apparent rally really been a delusion? Has not Justinian's policy of action and outlay on the grand scale been a megalomaniac's irreparable blunder? Has not he proved, *en fin de compte*, to have achieved nothing more than barren and ephemeral triumphs purchased at the cost of dissipating irreplaceable resources which Arcadius and Theodosius II had conserved and which Leo the Great, Zeno, and Anastasius had augmented?'⁵ This was the question that moved Procopius to think his second thoughts and to put these on record in *A Secret History of the Reign of Justinian and Theodora*.

Polybius

It will be seen that, while all five of the historians whom we have been considering were inspired to write their works by their experience of a war, the elemental question 'How has this come out of that?' came, in all five minds, to embrace a much wider gamut of historical change than just those events that could be construed as direct effects of the war which had originally precipitated the spate of intellectually fruitful questions. There are other historians to whom the elemental question presented itself from the outset in this broader form. For example, Polybius of Megalopolis (*vivebat circa* 206-128 B.C.) lived to see the number of

¹ Josephus: Preface to *The Romano-Jewish War* (Book I, chaps. 4-5).

² See the passage quoted in III. iii. 163.

⁴ The *De Aedificiis*.

³ See IV. iv. 54-55.

⁵ See IV. iv. 324-6.

Great Powers in a post-Alexandrine Hellenic World reduced from the five that had still been in existence at the time of the historian's birth to a single victorious survivor.

"The events which he has chosen as his subject are sufficiently extraordinary in themselves to arouse and stimulate the interest of every reader, young or old. What mind, however commonplace or indifferent, could feel no curiosity to learn the process by which almost the whole World fell under the undisputed ascendancy of Rome within a period of less than fifty-three years,¹ or to acquaint itself with the political organisation that was the secret of a triumph without precedent in the annals of Mankind? What mind, however much infatuated with other spectacles and other studies, could find a field of knowledge more profitable than this?"²

The experience of this political revolution in the Hellenic World of his day, which thus moved Polybius to ask the question 'How has this revolution come about?' also moved him to go on to ask two supplementary questions: 'Who are these Romans who have conquered the World within my lifetime?' and 'What is the intelligible field of historical study?'³

'If the two commonwealths which contended for world-power in this war had been objects of common knowledge [to the cultivated minority of the general public in the Hellenic World], it would perhaps have been superfluous to insert an introductory section in order to explain the policies and resources that inspired them to embark upon enterprises of such magnitude. Actually, however, the previous resources and transactions of the Roman and Carthaginian commonwealths are so unfamiliar to the majority of the Hellenic public that it has seemed essential to preface this history with two introductory volumes. This will ensure that no reader will find himself at the commencement of my main narrative without an answer to the question: "What policy was in the Romans' minds and what resources, military and economic, were in their hands at the time when they embarked upon these projects, which resulted in their becoming masters of the entire Mediterranean and its littoral?" These two introductory volumes will make it clear that the means at the Romans' disposal were admirably adapted to the end of world-power and world-empire, as conceived and attained by them.'⁴

The intellectual task, undertaken by Polybius, of putting these marchmen-conquerors of the Hellenic World on the Hellenic public's mental map was one for which the Megalopolitan statesman-historian had been singularly well equipped by the vicissitudes of his own life.⁵ Like Josephus after him, Polybius was deported from his native land by the Roman authorities—not, indeed, as the prisoner-of-war in chains that Josephus was when he was taken to Alexandria, but as a political hostage sentenced to internment. Like Josephus, again, Polybius, in the next chapter

¹ i.e. from the spring of 219 B.C., when Hannibal laid siege to Saguntum, to the 22nd June, 168 B.C., when Lucius Aemilius Paullus won his decisive victory over the Macedonians at Pydna.—A.J.T.

² Polybius: Preface to *Oecumenical History since the [initial year of the] One Hundred and Fortieth Olympiad* [220–219 B.C.] (Book I, chap. 1), quoted already in III. iii. 312–13.

³ This second of Polybius's two supplementary questions was the key which opened the door into a study of History in the mind of the present writer (see the present work, I. i. 1–50).

⁴ Polybius, op. cit., Book I, chap. 3.

⁵ See III. iii. 310–18.

of his personal story, succeeded in winning his Roman captors' confidence and esteem, and in Polybius's case this esteem flowered into a warm personal friendship between the Megalopolitan internee and his younger Roman contemporary, Publius Cornelius Scipio Aemilianus,¹ the son of the victor at Pydna who came to the front in Roman public life, both as a military commander and as a statesman, during the period of Polybius's internment in Italy (166-150 B.C.), and who subsequently took Polybius with him on his staff to the African front for the two Roman campaigns (*gerebantur* 147-146 B.C.) under Scipio's command that ended in the destruction of Carthage. When Polybius's fellow deportees from the city-states of the Achaean Confederacy had been relegated to Italian country towns, Scipio had obtained for Polybius the special privilege of being allowed to continue to reside in the capital. It will be seen that Polybius's portrait of Rome for the instruction of Hellenic eyes had been drawn from the life under exceptionally favourable conditions for the achievement of a faithful likeness.

Polybius's second supplementary question—"What is the intelligible field of historical study?"—opened up wider mental horizons.

"The coincidence by which all the transactions of the World have been oriented in a single direction and guided towards a single goal is the extraordinary characteristic of the present age, to which the special feature of the present work is a corollary. The unity of events imposes upon the historian a similar unity of composition in depicting for his readers the operation of the laws of Fortune on the grand scale, and this has been my own principal inducement and stimulus in the work which I have undertaken."²

The virtual unification of the Hellenic World, within the historian's own lifetime, on the political plane opened his eyes to the continuity,³ the universality,⁴ and the unity⁵ of History.

"Writers and readers of History ought to concentrate attention less upon the bald narrative of transactions than upon the antecedents, concomitants, and consequences of any given action. If you eliminate from History the "Why" and the "How" and the "Wherefore" of the particular transaction and the rationality—or the reverse—of its result, what is left of her ceases to be a science and becomes a *tour de force*, which may give momentary pleasure, but which is of no assistance whatever for dealing with the Future."⁶

"It is impossible to obtain from the monographs of historical specialists a comprehensive view of the morphology of Universal History. By reading a bald and isolated narrative of the transactions in Sicily and Spain, it is obviously impossible to realise and understand either the magnitude or the unity of the events in question, by which I mean the methods and institutions of which Fortune has availed herself in order to accomplish what has been her most extraordinary achievement in our generation. This achievement is nothing less than the reduction of the entire known world under the dominion of a single empire—a phenomenon of which there is

¹ See Polybius, op. cit., Book XXXI, chaps. 22-30.

² Ibid., Book I, chap. 4, already quoted in III. iii. 317, n. 5.

³ See *ibid.*, Book III, chaps. 31-32.

⁴ See *ibid.*, Book V, chaps. 31⁶-33.

⁵ See *ibid.*, Book VIII, chap. 2.

⁶ Ibid., Book III, chap. 31.

no previous example in recorded history. A limited knowledge of the processes by which Rome captured Syracuse and conquered Spain is, no doubt, obtainable from the specialists' monographs; but without the study of Universal History it is difficult to comprehend how she attained to universal supremacy. . . . It is only when we consider the fact that the same government and commonwealth was producing results in a variety of other spheres simultaneously with the conduct of these operations, and when we include in the same survey the internal crises and struggles which hampered those responsible for all the above-mentioned activities abroad, that the remarkable character of the events comes out clearly and obtains the attention which it deserves. This is my reply to those who imagine that the work of specialists will initiate them into Universal and General History.¹

A post-Modern Western historian, re-reading these passages from Polybius's work on the 18th September, 1952, was moved to wonder whether he might live to see 'the reduction of the entire known world under the dominion of a single empire'—a phenomenon of which there had in truth been as many previous examples in recorded history as there had been 'universal states'—inspire another Polybius to write the history of the political unification of another society. At the time of writing, it was impossible to foretell whether 'Fortune' would present this challenging theme to some responsive historian in the rising generation; it was not even possible yet to foretell whether, if a twentieth-century *Oikoumenê* did crystallize into unity, it would crystallize round the United States or round the Soviet Union. It might be guessed, however, that, if Rome's role were to be played in a post-Modern Western World by the United States, the historian of her involuntary assumption of dominion would be a West European, and it could be prophesied with greater confidence that, if the latter-day West European Polybius did leave his native land to do this piece of creative intellectual work, he would visit the United States neither as a prisoner-of-war nor as a political hostage but as the hospitably invited guest of some politically disinterested non-governmental American institution dedicated single-mindedly to the promotion of knowledge.

Josephus and Ibn al-Tiqtaqā

The opportunity, which Polybius found and seized, of making his conquered fellow-countrymen acquainted with their Roman conquerors was equally open to Josephus, who repaired to Rome some 236 years after Polybius had been deported thither; but the account of Roman institutions and policy which Josephus was so well qualified to write for the instruction of an Aramaic-reading Jewish public might not have found a market among the remnants of a shattered yet still Zealot-minded Jewry, in whose eyes the victorious Romans were still the same uninterestingly abominable Gentiles that they had always been, and in whose judgement the victory of Roman over Jewish arms was due, not to any notable human strength or virtue in the Roman Commonwealth, but to the inscrutable will of an omnipotent Yahweh. Josephus did emu-

¹ Polybius, op. cit., Book VIII, chap. 2.

late Polybius in turning to good account his intellectually advantageous footing in two culturally diverse camps, but the use that Josephus made of his opportunity was to address himself, as Polybius had done, to an Hellenic public whose curiosity was still insatiable. The supplementary question that Josephus took up after he had responded to the question raised by the Great Romano-Jewish War of A.D. 66-70 was, not 'Who are these Romans who have crushed an insurgent Palestinian Jewry?', but 'Who are these Jews who have brought this fate upon themselves by daring to challenge the might of an oecumenical empire commanding all the resources of a politically united Hellenic World?' This was the question that Josephus answered by writing, for an Hellenic public, *The Ancient History of the Jews*.

In this work Josephus commemorated, for the instruction of their conquerors, the history and êthos of a Jewish advance-guard of the Syriac Society which had gone down to disaster in a forlorn hope in one of the many engagements in the course of a one-thousand-years-long struggle between a post-Cyran Syriac and a post-Alexandrine Hellenic Civilization; and what Josephus had thus done for a Palestinian Jewry was done for the Syriac Society as a whole, in the last phase of its history, by the Shi'ī Muslim historian Ibn al-Tiqtaqā of Hillah¹ (*natus circa* A.D. 1262).

Ibn al-Tiqtaqā had been born in the metropolitan province of a re-integrated Syriac universal state on the morrow of the extirpation of the 'Abbasid Caliphate and incidental devastation of 'Irāq² by the Mongol war-lord Hülāgū in A.D. 1258. The question presented to him by his social milieu was: 'How has this world in which I have grown up—a world in which 'Irāq is economically derelict and politically subject to the rule of a Eurasian Nomad barbarian war-band—come out of the world in which my forefathers lived from one generation to another over a Time-span of more than five hundred years: a world in which 'Irāq was the garden and granary of the *Oikoumenē*, and in which an 'Abbasid oecumenical government ruled from Baghdad a universal state extending north-eastward to the Jaxartes, northward to the Caucasus, westward to the Atlantic, and southward to the Arabian and Sindī shores of the Indian Ocean?' The supplementary question that arose for Ibn al-Tiqtaqā, as it had arisen for Josephus, was: 'What have been the history and the êthos of this society that has met with this disaster?' And, in Ibn al-Tiqtaqā's generation, as in Josephus's, this was a question that was of some interest to the alien conquerors by whose hands the disaster had been inflicted; for Ibn al-Tiqtaqā lived to see a militarily subjugated Dār-al-Islām begin to take its savage Eurasian Nomad conquerors captive.³

¹ 'Ibn al-Tiqtaqā', 'the son of a chatterbox', was an onomatopoeic nickname for Jalāl-ad-Dīn Abu Ja'far Muhammad b. Tajī'd-Dīn Abī'l-Hasan 'Alī, the spokesman of the Shi'ī community in the Shi'ī holy cities—Hillah, Najaf, and Karbalā—in an 'Irāq that was to remain the stronghold of Shi'ism (see the note by Professor H. A. R. Gibb, printed in the present Study, I. i. 400-2) until the forcible conversion of Iran by Shah Ismā'il Safawī. See the notice of Ibn al-Tiqtaqā by Clément Huart in *Les Premiers siècles de l'Islam*, vol. ii (Leiden 1927, Brill), pp. 423-4. According to E. G. ... version of Mirzā Muhammad b. 'Abdī'l-Wahhāb-i-Qazwīnī's edition of 'Alā-ad-Dīn 'Atā Malik-i-Juwaynī's *Ta'rikh-i-Yahān Gushā* (London 1912, Luzac), p. lx, Ibn al-Tiqtaqā's name was Safīyū'd-Dīn Muhammad b. 'Alī b. Muhammad b. Tabātabā.

² See IV. iv. 42-45.

³ See Horace: *Epistulae*, Book II, Ep. i, l. 156.

After the Mongol conqueror Hülāgū's son and second successor Ahmad Takūdar (*dominabatur* A.D. 1252-4) had paid for his conversion to Islam by losing both his throne and his life at the hands of his outraged pagan Mongol *comitatus*,¹ Hülāgū's sixth successor Ghāzān Khān embraced Islam in the year of his accession, A.D. 1295, without suffering his great-uncle Takūdar's fate;² and this definitive conversion of the House of Hülāgū inaugurated a change of attitude on the converts' part towards a religion and culture that had now become theirs as well as their subjects'.³ The question 'What have been the history and *êthos* of this society that is now captivating its conquerors?' was answered by Ibn al-Tiqtaqā in a history of Islam from the epiphany of the Prophet Muhammad down to the sack of Baghdad by the Mongols in A.D. 1258, and a work that has become celebrated as *Al-Fakhrī* obtained its title from the name of Ghāzān Khān's governor of Mawsil, Fakhr-ad-Dīn 'Īsā, to whom the book was dedicated by the author. In this answer to the supplementary question that the historian's social milieu had presented to him, Ibn al-Tiqtaqā has succeeded in recapturing and reproducing something of the freshness and radiance of a dawn in which the Primitive Muslims Arab, as they went 'from strength to strength',⁴ had found it 'bliss to be alive'⁵ under a new dispensation in which the long despised and rejected⁶ Children of Ishmael were fortified by the conviction that they had been chosen by God to become the instruments of His will and purpose in place of the Jewish and Christian People of the Book.

'The same stone which the builders refused is become the headstone in the corner. This is the Lord's doing, and it is marvellous in our eyes.'

¹ See Browne, E. G.: *A Literary History of Persia*, vol. iii (Cambridge 1928, University Press), pp. 25-26.

² See I. i. 363.

³ On the 4th Sha'bān, 694 (the 19th June, 1295), Ghāzān 'and ten thousand Mongols made their profession of faith in the presence of Shaykh Sadr-ad-Dīn Ibrāhīm, the son of the eminent doctor Sa'd-ad-Dīn al-Hamawī. Nor did Ghāzān lack zeal for his new convictions; for, four months after his conversion, he permitted [the Mongol amir] Nawrūz [a previous convert who had been instrumental in converting Ghāzān,] to destroy the churches, synagogues, and idol-temples at Tabriz. He also caused a new coinage bearing Muhammadan inscriptions to be struck, and by an edict issued in May 1299 prohibited usury, as contrary to the Muhammadan religion. In November 1297 the Mongol amirs adopted the turban in place of their national head-dress' (Browne, E. G.: *A Literary History of Persia*, vol. iii (Cambridge 1928, University Press), pp. 40-41).

Ghāzān Khān's conversion secured for Islam not merely its survival but the recovery of its supremacy in the Il-Khāns' dominions, which included Iran, Armenia, and Eastern Anatolia, as well as 'Irāq. On this occasion the anti-Islamic reactions in the converted Il-Khān's pagan Mongol *comitatus* were successfully repressed (see Browne, op. cit., p. 41); and Ghāzān's brother and successor Khudābandah, *alias* Uljaytū (*accessit* A.D. 1305), who had been converted to Islam by his wife, promptly confirmed his predecessor's re-establishment of Islam as the official religion of this Mongol successor-state of the 'Abbasid Caliphate (see Browne, op. cit., p. 48), though his Christian mother had had him baptized as a child under the name of Nicholas (op. cit., p. 46).

The tragic losing battle fought by the Nestorian Christian Church in the Il-Khāns' dominions against a reflux tide of Muslim fanaticism, which the triumphant conversion of Ghāzān Khān had let loose, is graphically described in 'The History of the Life and Travels of Rabban Sāwma, Envoy and Plenipotentiary of the Mongol Khāns to the Kings of Europe, and Markōs who, as Mār Yahbhallāhā III, became Patriarch of the Nestorian Church in Asia', translated from the Syriac by Sir E. A. Wallis Budge under the title *The Monks of Kūblāi Khan, Emperor of China* (London 1928, The Religious Tract Society).

⁶ Isaiah liii. 3.

In this portrait of Primitive Islam, painted by a scion of the House of 'Alī, on the morrow of the death of a pre-Mongol Islamic commonwealth, to satisfy the slayers' posthumous curiosity about their victim, there is a touch of the serenity that comes over a human countenance when the hand of Death smoothes away the lines drawn there by the struggles of life.

'Alā-ad-Dīn Jūwaynī and Rashīd-ad-Dīn Hamadānī

The 'Irāqī historian Ibn al-Tiqtaqā's attractive history of the pre-Mongol Muslim Commonwealth in his own Arabic tongue was not the only notable historical work that was written under a Eurasian Nomad domination in the eastern half of Dār-al-Islām, on the morrow of the catastrophe of A.D. 1258, in response to questions raised by this harrowing experience; nor was this the only historical *motif* that was suggested by the spectacle of the 'Abbasid Caliphate's fatal collision with an erupting Mongol Eurasian Nomad Power.

One of the incidental and undesigned effects of the overthrow of the 'Abbasids and devastation of 'Irāq was, as we have noticed already in an earlier context,¹ the birth, in a *ci-devant* Syriac World's now derelict north-eastern provinces, of an Iranic Muslim Civilization, affiliated to the Syriac, in which, for most purposes other than the exposition of Islamic theology, a New Persian language and literature were to supplant the Arabic language and literature that had been dominant in all provinces of Dār-al-Islām during the six centuries intervening between the overthrow of the Sasanids by the Primitive Muslim Arab ghāzis and the overthrow of the 'Abbasids by the pagan Mongols. When a previously oecumenical Arabic culture retreated westwards before the face of the oncoming Mongols into a fastness in Egypt with a glacis in Syria and an eastern frontier at the western elbow of the River Euphrates, a New Persian literature that, by this time, had been on the rise for some three hundred years now at last came fully into its own; and this was perhaps the only creative cultural activity in the conquered and devastated half of Dār-al-Islām that benefited from the disaster on the very morrow of it. During the lifetime of the survivors of a generation in Dār-al-Islām that was old enough to have completed its education in a classical Arabic language and literature before the catastrophe of A.D. 1258, the cultivation of the New Persian language and literature was already relieved of the incubus of the cultural ascendancy of Arabic without being yet impoverished by being cut off from the living sources of Arabic literary inspiration. The period of Mongol domination in Iran and 'Irāq (*curriebat* A.D. 1258-1337) was an age in which the leading Persian men of letters were still bilingual in the full sense of still being able not merely to read Arabic but also to write in it, as well as in their native Persian tongue;² and it was also an age which produced

¹ See I. i. 71, with n. 3.

² This point is made by Browne in op. cit., vol. iii, pp. 62-65. The historian Rashīd-ad-Dīn (*vivebat circa* A.D. 1247-1318), for example, made it his practice to arrange for the translation of his Persian works into Arabic and the translation of his Arabic works into Persian. Rashīd-ad-Dīn's own account of these arrangements of his is quoted

incomparably eminent Persian historians,¹ in contrast to both the previous and the subsequent age, in which the brightest stars in the firmament of a New Persian literature were, not historians, but poets.²

The ascendancy of the historians in the intervening Il-Khānī Age is significant; and it is no less significant that the two greatest members of this pleiad—'Alā-ad-Dīn 'Atā Malik-i-Juwaynī (*vivebat* A.D. 1226–83) and Rashīd-ad-Dīn Fadlallāh Tabīb al-Hamadānī (*vivebat circa* A.D. 1247–1318)—were also eminent civil servants in the Mongol Il-Khāns' service, and that two of the lesser lights, Wassāf-i-Hadrat 'Abdallāh b. Fadlallāh of Shīrāz and Hamdallāh Mustawfī of Qazwīn, both of whom were protégés of Rashīd-ad-Dīn's, were officials of the Il-Khānī Government's Internal Revenue Department.³

The pagan barbarian conquerors of Iran and 'Irāq, who held out for thirty-seven years (A.D. 1258–95) after their conquest of Baghdad before succumbing to Islam themselves, had found themselves from the outset unable to dispense with the services of their newly acquired Muslim subjects; for the conquerors' purpose in invading Dār-al-Islām and overthrowing the Caliphate had been to step into the Caliph's shoes; and the only means by which these interloping barbarians could ensure that, after they had extinguished the Caliphate, the Caliph's government should be carried on for their benefit was by drawing upon an existing panel of native Persian Muslim professional administrators. The historian 'Alā-ad-Dīn 'Atā Malik-i-Juwaynī's brother, Shams-ad-Dīn Muhammad Juwaynī, managed the administration of Hūlāgū's appanage for the conqueror and for his first two successors during twenty-one years (A.D. 1263–84) of the Il-Khānī régime as their *sāhib-dīwān*,⁴ and the two brothers were the sons of a *mustawfī'l-mamālik* (minister of finance) and the grandsons of a prime minister of a by then already *fainéant* 'Abbasid Caliphate's Khwārizmian successor-state in the north-eastern marches of Dār-al-Islām, over against the Eurasian Steppe, on which the Mongol storm had broken in its full fury in A.D. 1220⁵ at the fiat of a world-conquering Chingis.

The grandfather had accompanied the last of the Khwārizm Shahs, Sultan Muhammad, and his indomitable son and successor Jalāl-ad-Dīn Mankubirni, when they had 'gone on the run', fighting rear-guard actions as they went.⁶ The father, who had lingered in Khurāsān, had

verbatim, from *man. arabe* No. 356, foll. 1 et seqq. in the Bibliothèque Nationale [*ci-devant* Royale] in Paris, by E. M. Quatremère in his life of Rashīd-ad-Dīn prefixed to his edition of part of Rashīd-ad-Dīn's *Yāmi'-al-Tawārikh* ('A Comprehensive Collection of Histories'), *Histoire des Mongols de la Perse*, vol. i (Paris 1836, Imprimerie Royale), pp. cxxxiv–cxxxvi. A student of History will be reminded of the cultural situation in Italy under an Ostrogoth domination (*durabat* A.D. 493–535), when the leading Italian men of letters were still conversant with Greek as well as with their native Latin.

⁶ See Browne, E. G., in Mirzā Muhammad Qazwīnī's edition of 'Alā-ad-Dīn Juwaynī's *Tārikh-i-Jahān Gushā* (London 1912, Luzac), p. xxi.

been rounded up at Tūs by the Mongol governor Jintimūr and taken, willy nilly, into the Mongols' service in A.D. 1232-3,¹ and his two sons, Shams-ad-Dīn and 'Alā-ad-Dīn, had followed in his footsteps. Shams-ad-Dīn had been in the service of Chingis' grandson and Qūbilāy's brother Hūlāgū, the commander of the Mongol forces on an anti-Islamic front in the Khwārizm Shāhs' already conquered domain to the north-east of the Caspian Gates, two years before his Mongol master's extirpation of the Ismā'īlī Shī'ī Assassins at Alamūt in A.D. 1257, and three years before his sack of Baghdad in A.D. 1258.² Shams-ad-Dīn's brother 'Alā-ad-Dīn, the historian (*natus* A.D. 1226), had entered the Mongol public service before he was twenty years old³ as the protégé of his father's Mongol patron Arghūn, who had been the governor of the Mongol Empire's anti-Islamic march before Hūlāgū Khān's arrival on this front in A.D. 1256,⁴ and he was one of three commissioners to whom Arghūn had entrusted the administration of Khurāsān when he had handed over his own command to Hūlāgū.⁵ 'Alā-ad-Dīn Juwaynī had then accompanied Hūlāgū Khān on his campaigns (*gesta* A.D. 1256-8) against the Ismā'īlī Power in Central and Western Iran and against the remnant of the 'Abbasid Power in 'Irāq;⁶ he was appointed governor of Baghdad by Hūlāgū in A.D. 1259, within a year of the conquest;⁷ and he continued—save for a few months in A.D. 1281-2, when he was under a cloud⁸—to hold this responsible administrative post till his death in A.D. 1283.⁹

The historian Rashīd-ad-Dīn, who gained his first access to the Il-Khānī Court as a professional physician during the reign of Hūlāgū's first successor Abāqā Khān (*dominabatur* A.D. 1265-82),¹⁰ was taken by Abāqā into the public administration, was appointed Grand Vizier by Ghāzān Khān (*dominabatur* A.D. 1295-1304),¹¹ and was retained in this post throughout the rest of Ghāzān's reign and the whole of his successor Khudābandah Ūjaytū's (*dominabatur* A.D. 1305-16). Both Shams-ad-Dīn Juwaynī and Rashīd-ad-Dīn Hamadānī obtained important posts in the public service for their sons and other relatives. One of Shams-ad-Dīn's sons, Bahā-ad-Dīn, had made his mark as governor of 'Irāq-i 'Ajam (the Jabal) and Fars before his death at the age of thirty;¹² and Rashīd-ad-Dīn's son Ghiyāth-ad-Dīn was appointed to his father's post of Grand Vizier¹³ by Abu Sa'īd (*dominabatur* A.D. 1317-34), the last effective ruler of the Il-Khānī line.

Public service proved to be as dangerous a trade for Persian men of

letters under a Mongol régime in Iran and 'Irāq as it had been for Roman men of letters under an Ostrogoth régime in Italy. The historian-governor 'Alā-ad-Dīn 'Atā Malik-i-Juwaynī, after his fall in A.D. 1281 and reinstatement in A.D. 1282, was so fortunate as to die, as Cassiodorus had died, in his bed; but Boethius's fate overtook first the historian's brother, the *sāhib-dīwān*, and then Rashīd-ad-Dīn and Rashīd-ad-Dīn's son, Ghiyāth-ad-Dīn, in turn. Shams-ad-Dīn Muhammad Juwaynī and his surviving sons were Ahmad Takūdar Khān's fellow-victims in the anti-Islamic *émeute* among the Il-Khān's pagan Mongol *comitatus* that was provoked by Takūdar's rashly premature conversion to Islam.¹ Rashīd-ad-Dīn, after having been dismissed from office by Ūljaytū Khān's successor Abu Sa'īd Khān in October 1317, was put to death, with his young son Ibrāhīm, on the 18th July, 1318, at the age of seventy-three, as the penalty for his having incautiously allowed himself to be persuaded to resume office.² Ghiyāth-ad-Dīn and a surviving brother of his met their deaths by violence in A.D. 1336, in the anarchy in which the Mongol régime in Iran and 'Irāq foundered after the death of Abu Sa'īd.³ In a Mongol Iran, as in an Ostrogoth Italy, the civil service was thus a hazardous occupation⁴ for a man of letters, but it was also a stimulating one.

The Persian civil servant historians of the Il-Khānī Age were stimulated by their social milieu to ask Polybius's questions as well as Josephus's and their own Josephan-minded Arab contemporary Ibn al-Tīqtaqā's.

Like Josephus, 'Alā-ad-Dīn 'Atā Malik-i-Juwaynī has commemorated, in the history of the Khwārizm Shāhs that constitutes the second part of his tripartite *Ta'rikh-i-Jahān-Gushā* ('A History of the World-Conqueror' Chingis Khan),⁵ the forlorn hope of an advance-guard of his society that had put up a valiant resistance to the onslaught of an overwhelming alien power, while Rashīd-ad-Dīn in his *Jāmi'-al-Tawārikh*

³ See *ibid.*, p. lii.

⁴ In both situations the danger arose from the interaction of two untoward factors. One of these was the barbarian rulers' proneness to suspect disloyalty in alien subjects whose professional services were indispensable to them because the intricacies of a civilized administration were beyond their own comprehension. The second untoward factor was the mutual rivalry and jealousy of the native professional civil servants themselves, who found it difficult to resist the temptation to further their own careers by denigrating their colleagues in the eyes of their ignorant and therefore credulous barbarian masters. Under the Il-Khānī régime the principal Persian officers of state were almost driven into falling foul of one another by the practice—introduced, no doubt, by the Mongol rulers deliberately, as a safeguard against possible abuses of power on the part of their Persian employees—of appointing a pair of Grand Viziers, equal with one another in status, without any demarcation, either territorial or functional, between their respective competences (see Quatremère, *op. cit.*, pp. xxxii-xxxiii).

⁵ An edition by Mirzā Muhammad b. 'Abd-al-Wahhāb of Qaswīn has been published in the E. J. W. Gibb Memorial Series, No. xvi, in three volumes (London 1912, Luzac). See also Browne, *A Literary History of Persia*, vol. iii, pp. 65-66. This work, which was completed in A.D. 1260, stops short of the fall of Baghdad in A.D. 1258, but tells, in the third of its three parts, the story of the fall of Alamūt in 1256. The whole of this Part III is devoted to the history of the Ismā'īlis down to Hülāgū's overthrow of their last Grand Master, Rukn-ad-Dīn Khurshāh, in Kūhistan and the Elburz. Juwaynī's work has been continued in Wassāf's, who has carried the regional history of Mongol rule in Iran and 'Irāq on from A.D. 1257, where Juwaynī's history stops, down to A.D. 1328 in his *Tajziyat-al-Amsār wa Tajziyat-al-A'sār* (see Browne, *op. cit.*, vol. iii, pp. 67-68).

('A Comprehensive Collection of Histories') has commemorated the history and ethos of the whole of the Syriac Society to which the Mongol invaders had given the *coup de grâce* that the Western Christian Crusaders had previously tried and failed to deliver. Moreover, in this part of his work, Rashīd-ad-Dīn has taken a broader view of the Syriac Civilization than has been taken by Ibn al-Tiqtaqā in *Al-Fakhīr*. The 'Irāqī Sayyid's historical vision is limited to the history of a pre-Mongol Islamic Commonwealth, whereas Rashīd-ad-Dīn treats the history of the Caliphate, from Abu Bakr to Musta'sim, merely as the second of three chapters of an essentially Iranian story in which the first chapter runs from a mythical dawn down to the fall of the Sasanian Dynasty, while the third chapter is occupied with the histories of the 'Abbasid Caliphate's Persian and Turkish successor-states down to the bursting of the Mongol Nomad tornado that has swept them all away.¹ The history of the same Syriac Civilization, seen from the same Iranian angle of vision, and presented within the same framework on the same lines, is the subject of the whole of Mustawfī's *Ta'rikh-i-Guzīdah* ('A Select History'),² in which the author thus shows himself to be, on this point, Rashīd-ad-Dīn's disciple as well as his protégé.

Moreover, for Rashīd-ad-Dīn, the history of a Syriac Civilization that has fallen a victim to the Mongols is not, even on the broader lines on which the Persian historian approaches it, either a whole in itself or an end in itself, as it is for the contemporary Arab historian Ibn al-Tiqtaqā. In Rashīd-ad-Dīn's work the history of his own civilization is introduced as an integral part of Universal History, and he has included Universal History in his 'Comprehensive Collection' because he has undertaken to answer the three questions that have likewise been the inspirations of Polybius's *Oecumenical History*:³ 'How has this revolution in human affairs come about?' 'Who are these previously obscure barbarians who have suddenly made their mark by conquering the World in our time?' 'What is the intelligible field of historical study?' According to Rashīd-ad-Dīn's own account of his intellectual history, he had begun to study the history of the Mongols on his own initiative;⁴ but he had not thought of writing history⁵ till he was commanded by his master Ghāzān Khān to write the history of the Eurasian Nomads⁶ (the part of his work corresponding to Polybius's account of the institutions and policy of the Romans), and thereafter, by Ghāzān's successor Khudābandah Ūljaytū, to write a Universal History and Geography⁷ (corresponding to the remainder of Polybius's work). Rashīd-ad-Dīn implies

¹ See Browne's arrangement of the component parts of Rashīd-ad-Dīn's 'Comprehensive Collection' in op. cit., vol. iii, p. 74. In this Iranocentric presentation of Syriac history the Arab Caliphate is treated, as will be observed, as the successor of the Iranian Empire of the Sasanidae, and not of the Arabian principality established by the Prophet Muhammad. Since Muhammad's career was contemporary with the last days of the Sasanian régime, his biography finds its place in this part of Rashīd-ad-Dīn's 'Comprehensive Collection', as a postscript to the volume devoted to the Sasanidae.

⁷ See *ibid.*, pp. 37-39 and 59.

that he might have shrunk from embarking on this vast scholarly and literary enterprise in the narrow margin of leisure left to him by his exacting official duties if he had not felt it to be part of these duties to obey, as best he could, these royal commands in a field outside the normal range of a civil servant's activities.¹ The credit due to the two Mongol princes for having thus set Rashīd-ad-Dīn to work is proclaimed in the titles given by the author to the two parts of his 'Comprehensive Collection'. His special history of the Mongols and Turks is called the *Ta'rikh-i-Ghāzānī*,² while his General History of Mankind is dedicated to Ūljaytū.

The historian's elemental intellectual question 'How has this come out of that?' presented itself in Rashīd-ad-Dīn's social milieu in the same terms as in Polybius's. 'What', this social milieu inspired the Persian historian to ask himself, 'has been the process by which almost the whole World has fallen under the undisputed ascendancy of the Mongols within a period of less than fifty-five years?'³ And this question has been put by Rashīd-ad-Dīn in the preface to his *A Comprehensive Collection of Histories* in terms reminiscent of the corresponding passage⁴ in Polybius's preface to his *Oecumenical History*.

'The beginning of every new religion or new empire constitutes a distinctive new era (*Ibtidā'-i-har milleti wa har dawlati ta'rikh-i-mu'ayyan bāshad*). Now what fact or event has ever been more memorable than the beginning of the dynasty of Chingis Khān, or has better deserved to be taken as marking a new era? The fact is that, within the span of a small number of years, this monarch . . . subjugated a great number of the kingdoms of the World and conquered and exterminated a host of unruly people. . . . When world-wide dominion devolved upon Chingis Khān and his noble kinsmen and illustrious descendants, all the kingdoms of the *Oikoumenē*—Chīn and Māchīn (South China), Khitāy (North China), Hind and Sind (India), Transoxania, Turkistan, Syria, Rūm, the Ās (Alans), the Russians, the Circassians, Qipchāq, Kalār (?),⁶ the Bashkirs—or, to put it in one word, all the countries within the four quarters of the compass—submitted to these princes and became subject to their ordinances . . . [Chingis Khān] gave the whole Universe one and the same physiognomy and instilled identical feelings into all hearts. He purified the domains of the empires by delivering them from the domination of perverse usurpers and from the oppression of audacious enemies. He handed his empire on to his illustrious kinsmen and noble descendants.'⁷

¹ See Rashīd-ad-Dīn, preface to the *Yāmi'*, Quatremère's translation, pp. 47-51.

² The second volume of the *Ta'rikh-i-Ghāzānī*, covering the history of the Mongol Khāqāns from the accession of Chingis' son Ogotāy to the death of Qūbilāy's grandson Timūr, has been edited by E. Blochet in the E. J. W. Gibb Memorial Series, vol. xviii (London 1911, Luzac). The chapters on the career of Hūlāgū Khān in the third volume, which covers the history of the Il-Khāns of Iran and 'Irāq down to the death of Ghāzān, have been edited, together with the preface to the whole of the *Yāmi'-al-Tawārikh*, by E. M. Quatremère in *Histoire des Mongols de la Perse*, vol. i (Paris 1836, Imprimerie Royale).

³ i.e. from the overthrow of Wang Khān the Karāyit by Chingis Khān the Mongol in A.D. 1203 (see II. ii. 237-8) to the overthrow of the 'Abbasid Caliph Mustā'sim by Chingis' grandson Hūlāgū in A.D. 1258.

⁴ Quoted on p. 64, above.

⁵ In the two preceding sentences the author has pointed out that 'new era' is one of two meanings of the word *ta'rikh*, the other meaning being 'chronicle'.—A.J.T.

⁶ See Quatremère's learned but inconclusive note 88, in op. cit., p. 72, on this enigmatic name.

⁷ Rashīd-ad-Dīn, *ibid.*, pp. 60-63 and 70-73.

This epoch-making revolution in the World's affairs raised, in minds that had grown up on the morrow of it, the two Polybian supplementary questions 'Who are these conquerors of the World?' and 'What is this World that they have conquered?' Rashīd-ad-Dīn addressed himself to the first supplementary question at Ghāzān's instance, and to the second at Ūljaytū's. In taking up the first of the two, Rashīd-ad-Dīn had been anticipated by 'Alā-ad-Dīn 'Atā Malik-i-Juwaynī; for the *Ta'rikh-i-Jahān-Gushā* was finished in A.D. 1260,¹ forty-six years before the *Ta'rikh-i-Ghāzānī* was presented by Rashīd-ad-Dīn to Ghāzān's successor Ūljaytū on the 14th April, 1306,² and the first of the three parts of Juwaynī's work deals with the history of Chingis Khān, his predecessors, and his successors down to his son Chaghatāy, whose appanage lay in Transoxania and the Zungarian Gap ('Mughalistan').³ It was, indeed, only to be expected that a Persian Muslim historian whose father and grandfather had been in the public service of the Khwārizm Shāhs should have written his answer to the question 'Who are these irresistible Mongol invaders?' forty-six years before the same question was answered by a Persian Muslim historian whose birthplace was Hamadān; for the Mongol storm had broken upon the Kwārizmian march of Dār-al-Islām as early as A.D. 1220, while Western Iran had not been exposed to it till A.D. 1256, when the Mongols forced the passage of the Caspian Gates in their campaign of that year against the Īsmā'īlis.

The purpose of the special history of the Mongols and Turks which Rashīd-ad-Dīn wrote in accordance with Ghāzān Khān's instructions was, in the author's own Herodotean words, 'to make sure that the memory of the extraordinary events and important facts that have signalized the epiphany of the dynasty of the Mongols should not be obliterated and annihilated by lapse of Time . . . nor suffer the fate of remaining concealed under an impenetrably thick veil [of ignorance]';⁴ and the civil servant historian proceeds to explain the grounds of his royal master's anxiety on this score. The history of the Mongols before and during their conquest of the World was by this time already unfamiliar to all but a few of Ghāzān Khān's subjects; it could be foreseen that the rising generation in the Il-Khān's Mongol *comitatus* would cease to feel any interest in their own family histories and in their ancestors' achievements; and it would be particularly disgraceful to allow oblivion thus to overtake the deeds of Chingis Khān and his Mongol companions, who had achieved, in their day, the unique feat of conquering the World. Reading between Rashīd-ad-Dīn's lines, we can surmise that Ghāzān had instructed his Persian Muslim civil servant to put on record the history of the pagan Nomads of the Eurasian Steppe because he had realized that his own *ci-devant* Nomad retainers—who had

¹ See p. 72, n. 5, above.

² See E. Berthels' article on Rashīd-ad-Dīn in the *Encyclopaedia of Islam*, vol. iii (Leiden 1936, Brill), pp. 1124-5.

³ See II. ii. 145.

⁴ Rashīd-ad-Dīn, *ibid.*, pp. 78-79. Compare the opening words of Herodotus's preface: 'Herodotus of Halicarnassus presents the results of his researches in the following work, with the twofold object of saving the past of Mankind from oblivion and ensuring that the extraordinary achievements of the Hellenic and Oriental worlds shall enjoy their just renown—particularly the transactions which brought them into conflict with one another'.

migrated from 'the Desert' to 'the Sown' forty years before the date of his own accession in A.D. 1395,¹ and who, in the act, had changed their trade by becoming herdsmen of human cattle in place of their former ungulate livestock²—would have been bound in any case soon to become assimilated to their more highly cultivated sedentary subjects and were destined to lose their Eurasian Nomad social heritage all the more quickly now that Ghāzān himself had accelerated their assimilation by his policy of conversion to Islam. Ghāzān Khān had become a devout Muslim without having ceased to be a patriotic Mongol and a proud Chingisid; and, in commissioning Rashīd-ad-Dīn to write in the New Persian language a history of the Mongols and Turks, Ghāzān was seeking to reconcile his new loyalty with his old one.

Rashīd-ad-Dīn—in constant attendance, as he had to be, upon his Il-Khānī masters in North-Western Iran in an age in which the Central Government of the Mongol Empire no longer had the power to summon the administrators of such outlying appanages to the Khāqān's Court to account to him there for their stewardship—had not enjoyed the opportunities, that had been thrust upon Juwaynī,³ of visiting Mongolia and

¹ The expeditionary force with which Hūlāgū made his conquests west of the Caspian Gates had left Qāraqorum in July 1252 and had left the Steppe behind for ever upon entering Transoxania in A.D. 1255, one season before the campaign of A.D. 1256 against the Ismā'īlis (see Browne, E. G.: *A Literary History of Persia*, vol. ii (London 1906, Fisher Unwin, pp. 452-3)). Thus, by the date of Ghāzān's accession, they had been vegetating for forty years in a demoralizing Land of Milk and Honey.

² The social unhealthiness of this change in a Nomad horde's way of life has been noticed in III. iii. 22-25.

³ Both 'Alā-ad-Dīn Juwaynī and his father Bahā-ad-Dīn Juwaynī before him had travelled more than once from Khurāsān to Mongolia and back in the course of their official duties in the Mongol public service. Bahā-ad-Dīn had been sent in A.D. 1235-6 by his captor and patron Jintimūr to the court of the Khāqān Ogotāy, who had confirmed the appointment to the post of *sāhib-dīwān* which Jintimūr had conferred upon him (Browne, *apud* Juwaynī, ed. cit., p. xxii); and he had been taken to Qāraqorum again by Arghūn, Jintimūr's second successor in the government of Khurāsān (see Browne, *ibid.*). 'Alā-ad-Dīn 'spent some ten years of his life in these journeyings to and fro' (Browne, *ibid.*, p. xxiv); and his third journey in Arghūn's company (*peregrinabantur* A.D. 1251-4, during the reign of the Khāqān Mangū) gave him the inspiration to write his history. On this occasion, he arrived at Qāraqorum on the 2nd May, 1252, and did not set out on his journey back to Khurāsān till September 1253.

'It was during this stay of a year and five months at the Mongol capital that it was suggested to our author by some of his friends . . . that he should compose this history to immortalize the great deeds and conquests of the Mongol sovereigns. A certain diffidence as to his capacity for this task at first prompted him to refuse, but he was ultimately convinced that he possessed certain almost unique qualifications for it, to wit his extensive acquaintance with the Mongol Empire and its most notable administrators, the free access to the most authentic sources of information permitted to him by the high official position which he held, and his first-hand knowledge of many important political events. He therefore finally agreed to undertake the task, which he began in A.H. 650 and concluded in A.H. 658 (A.D. 1252-60).'—Browne, *apud* Juwaynī, ed. cit., p. xxv.

A similar journey to the ordu of the Mongol Khāqān Mangū, in the heart of the Eurasian Steppe, inspired a notable work of Medieval Western Christian literature, the *Itinerarium Fratris Willielmi de Rubruquis, de Ordine Fratrum Minorum, Galli, Anno Gratie 1253, ad Partes Orientales*. Friar William of Rubruck arrived at Mangū's court some three months after the date of 'Alā-ad-Dīn Juwaynī's departure, and he attended on the Khāqān from January to June, inclusive, A.D. 1254.

Such journeys right across the breadth of the Old World were made possible by the Mongols' . . . what was certainly the . . . was perhaps also the . . . all the imperial postal- . . . (see VI. vii. 99).

See Marco Polo's account of it in *The Description of the World*, ed. by Moule, A. C., and Pelliot, Paul, vol. i (London 1938, Routledge), pp. 242-7. The experience of travelling post-haste from the Great Western Bay of the Eurasian Steppe to the high plateau of Outer Mongolia was as fatiguing as it was inspiring. See William of Rubruck, *op. cit.*,

collecting information about the Mongols at the fountain-head; yet in many respects the sources made accessible to Rashīd-ad-Dīn within the bounds of the Il-Khāns' dominions could bear comparison with those to which Juwaynī had had access at Qāraqorum.

'An authentic chronicle, written in the Mongol language and script,¹ had been written and been brought up to date at intervals, and this was deposited in the [Il-Khānī] archives; but in this form it had no order or method in it; it was an assemblage of isolated and incomplete fragments; it remained inaccessible and unknown to any students who would have been capable of extracting from it some notion of the facts and events recorded in it; and no one had ever received authorisation or permission to make use of it. . . .

'Ghāzān Khān . . . conceived the idea of having these state papers brought together and put in order . . . and the author . . . was instructed to collect the facts concerning the origins and genealogies of all the Turkish peoples in contact with the Mongols and to put into writing [in the Persian language], article by article, the historical records relating to these peoples, part of which is in the Imperial Archives, while the remainder is to be found in the hands of the [Mongol] amīrs and [other] members of the [Il-Khānī] Court.

'Down to that time, no one had been in a position to collect these records or been so fortunate as to have it in his power to put them in order and make a systematic history out of them; and those authors who had [previously] made the attempt to write the history of part of these events had had to do their work without possessing an exact knowledge of the facts.² They had been reduced to collecting oral narratives from the mouths of plebeians, along lines dictated by their own preconceived ideas; and no one could count on these traditions being true or exact.

'The present writer was commissioned to put these fragments of historical materials in order after having made a scrupulous examination of them; he was to digest them in plain language; and he was [thus] to bring . . . these hitherto completely inaccessible records to the light of day. If there were any events that were treated too summarily, or in too little detail, in these historical documents, he was instructed to fill the lacunae by collecting information on these subjects from the *savants* and doctors (*dānīyān wa hukamā*) of Khitāy [North China], India, Uighurland, Qipchāq and other countries—considering that representatives of all the peoples in the World are to be found at His Il-Khanian Majesty's Court.

chaps. 23, 24, and 55: 'In the space of two months and ten days, we did not rest except one single day, when we could not get any horses' (chap. 55). Friar William's predecessor, Friar John of Piano Carpini, . . . who had made the journey in A.D. 1245-47, paints the same picture: 'Passing through Comania we rode most earnestly, having change of horses five times or oftener in a day.'—*Libellus Historicus Joannis de Plano Carpini, qui missus est Legatus ad Tartaros A.D. 1246*, chap. 21.

¹ As Quatremère points out in op. cit., p. lix, Rashīd-ad-Dīn must have been able to speak Mongol in order to transact official business with the Il-Khān and his *comitatus*. He had also written several works in Mongol, according to a statement of his own which his French editor cites from *man. arabe* 356, fol. 213 r.—A.J.T.

² Is this an allusion to Juwaynī's *Ta'rikh-i-Jahān Gushā*? If so, its depreciatory innuendo recoils on Rashīd-ad-Dīn's own head; for Rashīd-ad-Dīn 'included in his great history . . . practically the whole contents of the three volumes of the *Jahān-Gushā*, condensing some portions (such as the history of the Mongol governors of Khurāsān and other provinces of Persia, and the history of the Khwārazm Shāhs), expanding others (such as the history of Chingiz Khān's youth and of his sons and grandsons, and the history of the Assassins), and leaving others (such as the history of Chingiz Khān's conquests in the domains of the Khwārazm Shāhs and in Persia, and the anecdotes of Ogotāy Khān's doings) almost unchanged' (Browne, *apud* Juwaynī, ed. cit., pp. lix-lx).—A.J.T.

'First and foremost, he was to consult . . . Pūlād Chingsang,¹ who has a unique . . . knowledge of the genealogies of the Turkish peoples and the events of their history—particularly the history of the Mongols.'²

These were the oral and documentary sources that Rashīd-ad-Dīn had at his disposal for carrying out Ghāzān Khān's instructions to write a Persian history of the Mongols; but, as the Persian historian tells us, Ghāzān's successor Khudābandah Ūljaytū Khān, when he read Rashīd-ad-Dīn's *Ta'rikh-i-Ghāzānī*, found the historian's answer to Ghāzān's question 'Who were these Mongol conquerors of the World?' raising in his mind the further question 'What is this World that the Mongols have conquered?' And Rashīd-ad-Dīn's new employer also had the acumen to perceive that at least one of the sources of information on which the historian had drawn in answering Ghāzān's question could also be turned to account for answering Ūljaytū's own. After having read the *Ta'rikh-i-Ghāzānī*, Ūljaytū pointed out to the author, so Rashīd-ad-Dīn tells us, that, hitherto, no one had ever written a comprehensive history of the whole *Oikoumenē* and all the peoples in it, but that an unprecedented opportunity for producing a work of this scope had arisen

'now that the *Oikoumenē*, from end to end, is subject either to us or to [other] Chingisids, with the result that doctors, astronomers, *savants* and historians (*hukamā wa munajjimān, wa arbāb-i-dānish wa ashāb-i-tawārikh*), representing all religions and sects (*adyān wa mīl*)—natives of Khitāy, Māchin, Hind, Kashmir, Tibet, Uighurland and other nations, Turk, Arab, and Frank—are assembled in large numbers under Our eyes, and considering that each of them possesses books which set out his country's history, chronology, and religious beliefs, and has at least a partial acquaintance with these different subjects.'³

With these considerations in mind, Ūljaytū Khān, who had piously refused to have the dedication of Rashīd-ad-Dīn's *Ta'rikh-i-Ghāzānī*, covering the history of the Eurasian Nomads, transferred from his dead brother's name to his own,⁴ now commanded the dynasty's Persian civil servant historian to enlarge the *Ta'rikh-i-Ghāzānī* into a *jami'-al-Tawārikh* by adding two new parts—a universal history and a universal geography⁵—which were to bear Ūljaytū's name. In this supplementary

¹ See Quatremère's note 95 *ibid.*, pp. 77–78. Pūlād was a Mongol of the Durban tribe. His father had been Chingis Khān's 'cook' (i.e. a confidential officer in his household). Pūlād himself had entered the service of Chingis' grandson and Hūlāgū's brother Qūbilāy, and had been invested by him with the Chinese title *chingsang* in addition to his hereditary Mongol title *baurji*, the Mongol word for 'cook'. He was the permanent diplomatic representative of the House of Qūbilāy at the Il-Khān Court. In the Il-Khāns' own Mongol *comitatus* there was also a wealth of historical tradition to be harvested; for, as Rashīd-ad-Dīn records in his history of Hūlāgū Khān (see Quatremère's edition, pp. 130–3), Hūlāgū's brother the Khāqān Mangū, when he sent Hūlāgū to enlarge the bounds of the Mongol Empire south-westwards, reinforced Hūlāgū's existing *comitatus* by making for him a special levy of two men out of every ten in the war-bands of all the other Chingisid princes. 'This is why in our countries [i.e. in the Il-Khān's dominions] there always have been, and still are, [Mongol] amirs who are descendants and relations of each of the amirs of Chingis Khān, and each of these still holds his hereditary office.'

⁴ See *ibid.*, pp. 36–37.

⁵ No manuscript of Rashīd-ad-Dīn's universal geography was extant as far as was known at the time of writing.

work, which was duly completed in A.D. 1310-11,¹ the universal history fills four volumes. The first three are those presenting the history of the Syriac Civilization in terms of Iranian history which have already been mentioned.² The fourth breaks new ground³ by bringing Turkish, Chinese, Israelite, Frankish, and Indian history into the picture.

Rashīd-ad-Dīn was exceptional among his co-religionists in the Il-Khānī dominions in his day in being psychologically as well as intellectually well qualified for carrying out his second and major historical task. The majority of his fellow Muslims had been exasperated by the temporary favour which a local Christian and Jewish minority had been enjoying during the first phase of a revolutionary régime in which the barbarian conquerors had remained, not merely pagan in their practice, but also positively anti-Muslim in their feelings. The fanatical mood consequently prevalent in the Persian Muslim community is in sharp contrast with Rashīd-ad-Dīn's respect and sympathy for non-Muslim scholarship.

'Although [he ventures to write in his preface]⁴ the tradition of the Muslims is greatly superior to that of the other peoples, all the same we cannot take it as our guide in dealing with the history of the non-Muslim peoples. It goes without saying that the facts which, in the traditions of any people, have been transmitted through a continuous chain of authorities have to be accepted as authentic,'

and he informs us that, in compiling his geographical gazetteer, he has lived up to his own principles.

'In his endeavour to draw on all available sources and to verify his results, the author, in this volume, has not been content merely to assemble everything that has hitherto been known in this country and has been described or delineated in [our] books; he has supplemented this existing information with the facts which, in this fortunate age, the doctors and *savants* (*hukamā wa dāniyān*) of Hind, Chīn and Māchīn, Frankland and other foreign parts have found in their books and have certified as being authentic after having scrupulously verified them.'⁵

A Persian Muslim theologian-historian, Nāsir-ad-Dīn al-Baydāwī, who was Rashīd-ad-Dīn's contemporary, records⁶ that, when Rashīd-ad-Dīn was setting out to write his section on the history of Khitāy (North China), he consulted two Chinese scholars at Ūjaytū's Court—Li Tachi and Mak Sun—who were authorities on Far Eastern medicine, astronomy, and history and who had brought with them, from China, books dealing with these subjects. On the strength of their recommendation, Baydāwī tells us, Rashīd-ad-Dīn based his account of Chinese history on a compendium, written by three Chinese Buddhist monks, which,

¹ See Browne, op. cit., vol. iii, p. 72.

² On p. 73, above.

³ Rashīd-ad-Dīn had, however, had at least one predecessor in this exotic field. Abū Rayhān al-Bīrūnī (*natus* A.D. 973) had not only published, *circa* A.D. 1000, *A Chronology of Ancient Nations*; he had also taken the opportunity, opened up for Persian Muslim scholars by Mahmūd of Ghaznah's conquests in India, to publish, soon after A.D. 1030, his *Indica* (see Browne, *A Literary History of Persia*, vol. ii, p. 101).

⁴ In Quatremère's edition, pp. 44-45.

⁵ Rashīd-ad-Dīn, *ibid.*, pp. 58-61.

⁶ See Quatremère in his life of Rashīd-ad-Dīn, p. lxxviii. Baydāwī's historical work was still unpublished at the time of writing.

his two Chinese consultants assured him, had been verified, approved, and passed for the press by a consensus of Chinese litterati.

The oecumenical outlook with which Rashīd-ad-Dīn was thus inspired by the social milieu of the Il-Khānī Court was transmitted by him to at least one disciple, Abū Sulaymān Dā'ūd of Banākat in Transoxania, who enjoyed the same intellectual advantages in virtue of being Ghāzān Khān's poet laureate.

'His information about the Jews, Christians, Indians, Chinese, and Mongols, though largely directly borrowed, often in the same words, from the pages of Rashīd-ad-Dīn, was nevertheless undoubtedly supplemented by what the author learned orally from representatives of the peoples in question. In no Persian history before the Mongol period, and in few after it, do we find so many references to places, people, and historical events beyond the ken of most Muslim writers: places like Portugal, Poland, Bohemia, England, Scotland, Ireland, Catalonia, Lombardy, Paris, and Cologne; people like the Roman Emperors, from Romulus downwards, and the Popes from Saint Peter to the Pope contemporary with the author, who is said to be the two hundred and second in succession; and events like the different church councils, the conversion of Britain to Christianity in the time of Pope Eleutherius, the Nestorian heresy, and the like.'¹

Herodotus

The element in their social milieu that thus inspired a Rashidian school of post-Mongol Persian Muslim historians to rise to an oecumenical view of History was evidently the abrupt encounter, at the Il-Khānī Court, between the representatives of diverse religions and cultures. This cultural effect of the temporarily high conductivity of the Mongol Empire, within an area extending to the Euphrates from Korea and to the Volga from Burma, was the feature that also made the strongest impression on the imaginations of Western Christian observers.² The lists, in Rashīd-ad-Dīn's pages, of subject countries and peoples—as alien from one another in their habits and *éthos* as they are physically far apart—are reminiscent of the similar lists in the inscriptions of the Achaemenidae and on the pages of Herodotus. The similarity is not fortuitous, for in both cases we are in the presence of a universal state that has been established, suddenly and unexpectedly, through sweeping conquests achieved by a hitherto obscure semi-barbarian people from the back of beyond, and it is not surprising that an identical social milieu should have inspired Herodotus, as well as Rashīd-ad-Dīn, first to ask the question 'What is this World that has just been united politically by conquest?' and then, in seeking for the answer, to arrive at the conclusion that no field smaller than the entire *Oikoumenē* since the dawn of Civilization is an intelligible field of historical study.

Like Clarendon, Procopius, Josephus, Thucydides, and Rhodes,

¹ Browne, *op. cit.*, vol. iii, pp. 101-2.

² See, for example, the passage, illustrating this point, that has been quoted, in V. v. 113-14, from the narrative of the Flemish Franciscan friar William of Rubruck, who made the 'round trip' from the Crimea to the Khāqān Mangū's ordu at Qāraqorum and back, via Bātū Khān's ordu in the Great Western Bay of the Eurasian Steppe, in A.D. 1253-5.

Herodotus found his immediate inspiration in a great war that had been waged within his own lifetime. Native, as he was, of a Hellenized Carian city on the south-west coast of the Asiatic mainland, he had been born a subject of the Achaemenian Empire and had lived to see his birthplace exchange a Persian for an Athenian suzerainty. 'How has this revolutionary change in the political fortunes of the Asian Hellenes come about within my own lifetime?' was the first form in which the historian's elemental question 'How has this come out of that?' presented itself to Herodotus's mind, and in three books he duly wrote a history of the two decisive first campaigns in the Great Hellenic-Persian War of 480-450/449 B.C.¹ But Herodotus, like Rashīd-ad-Dīn and Polybius, found himself unable to answer his original question without being moved to ask himself a supplementary one which eventually came to overshadow it; for the war whose history he had undertaken to write was a war in which the belligerents were representatives, not merely of different political Powers, but also of different civilizations. The Hellenic Society had collided with a Syriac Society which, through the agency of the Achaemenidae, had united the domains of a Babylonian, an Egyptian, and a submerged Hittite Society with its own domain within the framework of a single universal state.² Thus, in writing the history of an Hellenic-Persian War, Herodotus was led on to study a cultural encounter involving no fewer than five distinct civilizations and in fact six, considering that the Eurasian Nomads were also a party to the transaction; and from this contemporary scene he was led backwards in Time into a study of the separate history and origin of each of his *dramatis personae* and into an inquiry into previous encounters between them in a concatenation in which the Hellenic-Persian War that had broken out in 480 B.C. came to look like the latest link in a long chain of episodes of the kind.³

Thus Herodotus's work, like Rashīd-ad-Dīn's, grew in its author's hands. Ūljaytū Khān's demand on Rashīd-ad-Dīn for a universal history led him to append five additional volumes (reckoning in the geographical gazetteer) to the three volumes of his *Ta'rikh-i-Ghāzānī*. Herodotus's discovery of a concatenation of encounters between East and West led him to prefix six additional books to his three books recording the history of the two campaigns of 480-479 B.C. in the Great Hellenic-Persian War.

In savouring the diversity in habits and *êthos* between the various civilizations whose encounters he was recording, Herodotus was on the brink of another supplementary question which might have carried him a long step nearer to the heart of the mystery of Human Nature and Destiny.

'When Darius was on the throne [Herodotus reports]⁴ he summoned

¹ 450/449 B.C., rather than 449/448, is the probable date of the Peace of Callias according to H. T. Wade-Gery in *Harvard Studies in Classical Philology*, special supplement volume, pp. 149-52 (Cambridge, Mass. 1940, Harvard University Press).

² See I. i. 78-81; II. ii. 137-8; IV. iv. 471; V. v. 122-3; and VI. vii. 64.

³ See IX. viii. 454-63.

⁴ Herodotus: Book III, chap. 38 (see this Study, VI. vii. 617, n. 5). The story might have been impugned as being merely *ben trovato* if its veracity were not vindicated by first-hand accounts of similar confrontations between irreconcilable practices and beliefs

into his presence the Hellenes at his court and asked them for what price they would consent to make a meal of their fathers when they died. The Hellenes replied that all the money in the World would not induce them to do such a thing, whereupon Darius summoned the Callatian Indians, who do eat their parents,¹ and asked them (in the presence of the Hellenes, who were kept informed, through an interpreter, of the tenour of the conversation) for what price they would be willing to burn their fathers when they died. The Indians shrieked aloud and begged him not to pursue such an unmentionable subject—a story which illustrates the habitual attitude of Mankind towards this question, and which, in my opinion, justifies Pindar's poetic aphorism that "Custom is king of all".

Turgot

The confrontation of sharply diverse cultures with one another through the political union of their habitués under an oecumenical Achaemenian régime caught the imagination, not only of the contemporary Hellenic observer Herodotus, but of the Modern Western philosopher civil servant Turgot (*vivebat* A.D. 1727–81). 'Effet singulier', Turgot remarks in his *Esquisse d'un Plan de Géographie Politique*,² 'de la conquête de la Lydie par Cyrus, qui dévoila l'un à l'autre comme deux mondes politiques'; and the spectacle of a cultural phenomenon in which Herodotus had seen nothing more than one of those minuscule that could provide him with a piquant story opened up in Turgot's mind a new approach to the study of human affairs. This many-sided Modern Western man of genius was so sensitive to hints offered to him by his cultural heritage, and so perceptive in his intuition of the implications, that he succeeded in divining the historical significance of a universal state at second-hand; and he achieved this with a minimum of intellectual illumination from his own social milieu; for, though the eighteenth-century Western Society into which Turgot had been born was in contact with a number of alien civilizations and primitive societies as the result of a Modern Western conquest of the Ocean, Turgot's generation of Westerners was as remote in spirit as it was in time from any direct experience of the creative agony out of which a universal state is born.

The lesson that Turgot found in an Herodotean historical panorama was the idea that the observable diversity between different contingents in the living generation of Mankind might provide a key to the understanding of History.

'Je vois tous les jours inventer des arts;³ je vois dans quelques parties

at the Courts of the Northumbrian King Oswiu (see II. ii. 335), the Khān of the Khazars (see VI. vii. 106, n. 3), the Russian war-lord Vladimir (see *ibid.*), the Mongol Khāqān Mangū (see William of Rubruck's narrative, chap. 51), and the Timurid Mughal Emperor Akbar (see V. v. 700–1).—A.J.T.

¹ This practice is ascribed to the Tibetans in William of Rubruck's narrative, chap. 28.—A.J.T.

² *Œuvres de Turgot* (Paris 1844, Guillaumin, 2 vols.), vol. ii. p. 618.

³ This passage appears to have been written in or about the year A.D. 1750, when the Western Industrial Revolution, though not yet broken out. Another illustration of Turgot's prescience is his prediction on 15th December, 1750, of a Declaration of Independence that was to be made a quarter of a century later. 'Les colonies sont comme les fruits qui ne tiennent à l'arbre que jusqu'à leur maturité: devenues suffisantes à elles-mêmes, elles firent ce que fit depuis Carthage, ce que fera un jour l'Améri-

du monde des peuples polis, éclairés, et dans d'autres des peuples errants au sein des forêts. Cette inégalité de progrès dans une durée éternelle aurait dû disparaître. Le monde n'est donc pas éternel; mais je dois conclure en même temps qu'il est fort ancien. Jusqu'à quel point? Je l'ignore.¹

'Si je veux savoir quelque chose de précis, je suis entouré de nuages. . . .² Une clarté faible commence à percer la nuit étendue sur toutes les nations, et se répand de proche en proche. Les habitants de la Chaldée, plus voisins de la source des premières traditions, les Égyptiens, les Chinois, paraissent devancer le reste des peuples; d'autres les suivent de loin; les progrès amènent d'autres progrès. L'inégalité des nations augmente: ici les arts commencent à naître; là ils avancent à grands pas vers la perfection. Plus loin ils s'arrêtent dans leur médiocrité; ailleurs les premières ténèbres ne sont point encore dissipées; et, dans cette inégalité variée à l'infini, l'état actuel de l'univers, en présentant à la fois sur la terre toutes les nuances de la barbarie et de la politesse, nous montre en quelque sorte sous un seul coup d'œil les monuments, les vestiges de tous les pas de l'esprit humain, l'image de tous les degrés par lesquels il a passé, l'histoire de tous les âges.'³

The essays and notes from which the foregoing passages have been quoted testify to the greatness of the student of History who was put out of action on the threshold of his intellectual career by the great civil servant whose life-work was to conjure the Ideas of 1789 out of his creative administration of a decrepit *ancien régime*. Re-reading in A.D. 1951 the essays and notes⁴ in which this lost Western historian has sketched the ground-plan of a mighty intellectual edifice, and recalling that Turgot was only twenty-three years old when he wrote these luminous fragments in A.D. 1750, a latter-day Western historian who had spent ten years of his working life as a temporary civil servant could not forbear to cry 'Qualis artifex perit'⁵ when he read in a notice of the great eighteenth-century philosopher civil servant's career that he had entered the public service on the 5th January, 1752, hardly more than eighteen months after the delivery of the first, and twelve months after the delivery of the second, of his two epoch-making discourses at the Sorbonne.

que'.—Turgot, A. R. J.: *Second Discours en Sorbonne, sur les Progrès Successifs de l'Esprit Humain* (ibid., vol. ii, p. 602).—A.J.T.

⁵ Suetonius: *The Lives of the Caesars*, 'Nero', chap. xlix, § 1.

Ibn Khaldūn

Ibn Khaldūn al-Hadramī of Tunis (*vivebat* A.D. 1332-1406)¹ was inspired by the same social milieu as the Sayyid Ibn al-Tiqtaqā al-Hillawī and as Ibn Khaldūn's fellow civil servant Rashīd-ad-Dīn al-Hamadānī to give to the historian's elemental question 'How has this come out of that?' the same particular application. 'How has this derelict Dār-al-Islām come out of that once flourishing Dār-al-Islām?' was the form in which the question presented itself to Arab and Persian alike, in the Maghrib² as well as in the two 'Irāqs,³ on the morrow of the dissolution of a Syriac Society which, in its last phase, had been embodied politically in the Caliphate.

'We have heard with our ears, O God—our fathers have told us⁴—what Thou hast done in their time of old: How Thou hast driven out the heathen with Thy hand, and planted them in; how Thou hast destroyed the nations and cast them out. For they gat not the land in possession through their own sword, neither was it their own arm that helped them, but Thy right hand and Thine arm and the light of Thy countenance, because Thou hadst a favour unto them. . . .

'But now Thou art far off and putttest us to confusion and goest not forth with our armies. Thou makest us to turn our backs upon our enemies, so that they which hate us spoil our goods. Thou lettest us be eaten up like sheep and hast scattered us among the heathen. Thou sellest Thy people for naught and takest no money for them. Thou makest us to be rebuked of our neighbours, to be laughed to scorn and had in derision of them that are round about us. Thou makest us to be a byword among the heathen, and that the people shake their heads at us.'⁵

How has the bright dawn of the first generation of Islam thus faded away into the dreary darkness of a social interregnum? A question evoked in Ibn al-Tiqtaqā's mind by the contrast between the Present and the Past in 'Irāq was evoked in Ibn Khaldūn's mind by the same contrast in the Maghrib; and, though the barbarians by whose hands a paradise had been turned into a wilderness were not the same in the two halves of this devastated world, the Banu Hilāl's handiwork west of the Libyan Desert was indistinguishable from the Mongols' handiwork east of the Euphrates, and an identical tragedy presented the same intellectual problems. 'What was this society that has suffered this downfall?' was the first question with which Ibn Khaldūn, as well as Ibn al-Tiqtaqā, found himself confronted; and a question that the 'Irāqī Sayyid-historian had answered by writing *Al-Fakhrī* was answered by Ibn Khaldūn in *A History of the Berbers*.

Like an 'Irāqī Ibn al-Tiqtaqā's Persian contemporaries 'Alā-ad-Dīn al-Juwaynī and Rashīd-ad-Dīn al-Hamadānī, a Maghribī Ibn Khaldūn set the history of the Islamic Commonwealth within a wider frame; and he, too, found that even the broadest regional framework would not provide him with an intelligible field of study. Like Rashīd-ad-Dīn, Ibn Khaldūn was thus constrained, in answering one question, to ask an-

other. 'What is this *Oikoumenê* whose provinces—an Islamic World or an Iran or a Barbary—have discovered their kinship with one another through the common experience of a supreme calamity?' Like Rashīd-ad-Dīn's regional history of Iran, Ibn Khaldūn's regional history of the Berbers was incorporated by its author into a *Universal History*;¹ but this achievement, in which Rashīd-ad-Dīn had reached his intellectual 'ceiling', moved Ibn Khaldūn to climb on into a higher intellectual sphere by asking himself the further question: 'How comes it that empires suffer the decline and fall exemplified in the history of the Islamic Commonwealth?'; and he gave his answer to this question in his Prolegomena (*Muqaddamāt*).² An analysis of this answer has been attempted in a previous passage of this Study³ which need not be recapitulated here. In this place we need only recall that he set out to explain the declines and falls of empires in sociological terms, but discovered that this would-be strictly scientific explanation did not account for all the phenomena.

Though Ibn Khaldūn, like Rashīd-ad-Dīn, had won an intuition of Universal History, the Maghribī's actual range of historical vision was not so wide. It was virtually limited to the history of the rise and fall of Ibn Khaldūn's own Islamic Commonwealth, and the narrowness of this field deluded the Maghribī historian into two erroneous beliefs. He believed that an *esprit de corps* ('*asabīyah*') which was manifestly the psychological cement of all political communities was a monopoly of Nomad peoples in their pristine habitat and that, in virtue of possessing this politically indispensable psychological asset, the Nomads had also enjoyed a monopoly in the business of empire-building. Since he correctly recognized the historical truth that the *ci-devant* Nomad's *esprit de corps* becomes a wasting asset when once its possessor has drifted into becoming a parasitical shepherd of men, instead of remaining the providential shepherd of sheep that it is his proper vocation to be, Ibn Khaldūn's first essay in trying to account for the declines and falls of empires was to explain them as being the necessary consequence of the inevitable demoralization of the *ci-devant* Nomad conquerors through their social intercourse with their sedentary subjects. Knowing of no sedentary peoples except the tax-paying population of the Roman and Sasanian empires whom the Primitive Muslim Arab conquerors had taken over as the most valuable part of their spoils of war, Ibn Khaldūn fell into the further erroneous belief that, *ex officio*, all sedentary peoples must be destitute of *esprit de corps*; and, from this misleading combination of three false premises with one true premise, it followed logically that all empires must decline and fall within the number of generations that it would take for empire-builders who, *ex hypothesi*, were *ci-devant* Nomads to lose their politically creative ancestral virtue through acquiring their sedentary subjects' politically destructive ancestral vice.

This simple explanation of the declines and falls of empires was

¹ See III. iii. 324, n. 1.

² See III. iii. 322. The contents of Ibn Khaldūn's whole work are presented by de Slane in his translation of the *Muqaddamāt* (*Les Prolegomènes d'Ibn Khaldoun*, traduits en français et commentés (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. i. pp. xcv-cv).

³ In III. iii. 473-6: 'The Relativity of Ibn Khaldūn's Historical Thought'.

borne out by all the historical evidence within Ibn Khaldūn's ken, and it would serve equally well to account for the transitoriness of the work of other *ci-devant* Nomad empire-builders whose histories were beyond Ibn Khaldūn's horizon. Yet, in our list of empire-builders in our table of universal states in this Study,¹ only five will be found in fact to have had a Nomad ancestry.² We may infer that, if Ibn Khaldūn had happened to command the wider horizon that was within any twentieth-century Western historian's purview, he would have recognized that his sociological hypothesis would not serve to explain more than a fraction of the phenomena; and, even within a horizon limited to the confines of the Maghrib, there was in fact one crucial piece of evidence that was refractory to Ibn Khaldūn's sociological explanation of declines and falls.

The derelict state of the Maghrib in Ibn Khaldūn's day, which had been the Maghribī inquirer's point of intellectual departure, was known by him to have been the consequence of ravages committed by two Arab Nomad tribes, the Banu Hilāl and the Banu Sulaym, who had been let loose against a rebellious Maghrib by the 'Fātimid' rulers of Egypt and Syria in A.D. 1051;³ but, if the historian was right in holding that the rises and falls of empires were simply functions of the strength and weakness of the *esprit de corps* of Nomad empire-builders, then, *ex hypothesi*, the Banu Hilāl and Banu Sulaym ought to have brought upon the Maghrib, not the disaster which they had admittedly brought in fact, but the prosperity which had followed in the train of the Primitive Muslim Arab conquerors of the Maghrib some four hundred years before the date of the Banu Hilāl's devastating westward trek in the wake of that fertilizing previous wave of Arab conquest. These two invading hosts had both been Arab, both been Nomad, and both therefore been endowed with the sovereign social virtue of *esprit de corps*. Why, then, had the social effects of these two Arab Nomad invasions been, not identical, but antithetical? This failure of Ibn Khaldūn's sociological theory to explain North-West African historical facts led Ibn Khaldūn to the conclusion⁴ that a Nomad *esprit de corps*, which (as he saw it) was a *sine qua non* for the social enterprise of empire-building, was at the same time not enough in itself to ensure success.

Why was it that an eleventh-century Arab Nomad invasion had worked havoc in the Maghrib where a seventh-century Arab Nomad invasion had proved a blessing? The answer must be that the second wave of Arab Nomad invaders had lacked some essential qualification, other than their

¹ Printed in vol. vi, on p. 327, and in vol. vii, on p. 769.

² These five *ci-devant* Nomad empire-building peoples are the Amorite restorers of the Sumeric Empire of Sumer and Akkad, the Chaldaean founders of a Neo-Babylonian Empire, the Arab reconstructors of a Syriac universal state, the Mongol founders of a universal state for the main body of the Far Eastern Society, and the 'Osmanli founders of a universal state for the main body of Orthodox Christendom. The Timurids who founded a universal state for the Hindu World were not of Nomad origin, notwithstanding their assumption of the name 'Mughals'. They were descended from a champion of the sedentary population of Transoxania who had been his countrymen's leader in a war of liberation from a Nomad yoke (see II. ii. 144-150). The Manchu reconstructors of a Far Eastern universal state were, not Nomads, but sedentary highlanders who, before they had taken to agriculture, had made their living by hunting in the forests, not by stock-breeding on the Steppe.

³ See III. iii. 323.

⁴ See III. iii. 474-5.

common *esprit de corps*, which the first wave had possessed; and the chapter-headings in Ibn Khaldūn's Prolegomena¹ record the movement of his thought on this point. 'It is impossible', this train of thought begins, 'to establish a domain or to found a dynasty without possessing the support of a people animated by *esprit de corps*', and 'an enterprise which aims at securing the triumph of the religious principle can only succeed if it finds a strong party to support it.' *Esprit de corps* is, in fact, indispensable; but at the same time—and this is the new and crucial point—*esprit de corps* is not sufficient in itself. 'In general, the Arabs are incapable of founding an empire *unless* they have received a tincture of Religion of a certain strength from some prophet or saint'; 'the religious teaching of a prophet or a preacher of the Truth is the only basis on which a great and powerful empire can be founded'; and 'a dynasty which starts its career by placing itself on a religious basis will thereby double the effectiveness of the *esprit de corps* which is the means of its establishment.' It will be seen that the failure of a secular sociological explanation of the rises and falls of empires to account for the course of history in the Maghrib has led Ibn Khaldūn to introduce a new actor on to the stage of History and, in doing so, to give History itself a new dimension. His conclusion is that human affairs do not constitute an intelligible field of study so long as the inquirer is attempting to study them in isolation from the action of Man's Creator; and this is equivalent to saying that Man's *Oikoumenē* only becomes intelligible when it is recognized as being a fragment of God's Universe.

Saint Augustine

Ibn Khaldūn is here saying, in effect, that Man on Earth is a denizen of two worlds and a citizen of two commonwealths simultaneously. Man has a franchise in a mundane commonwealth in virtue of a human *esprit de corps*, and at the same time a franchise in a supra-mundane commonwealth thanks to divine revelations. This ultimate answer to a series of questions evoked by the tragic spectacle of the downfall of a civilization had already been given, a thousand years before Ibn Khaldūn's time, by another Maghribī man of genius who was of native Berber, not of immigrant Hadramī, origin, and whose Semitic *lingua franca* was, not Arabic, but Canaanite.² It is virtually certain that Ibn Khaldūn had never read Saint Augustine's *De Civitate Dei*, and perhaps improbable that he had ever even heard of it; and we may also guess that Augustine himself, when he propounded his transcendental thesis of Man's dual citizenship, was hardly conscious that he was applying, in a new and larger context, a concept which, from the fourth century B.C. down to the second century of the Christian Era, had been the constitutional keystone of the mundane commonwealth built up by the Romans.³

The inquiry which Augustine carried to a transcendental altitude had been initiated in his mind by an experience of mundane disaster that also moved Ibn Khaldūn, Rashīd-ad-Dīn, Juwaynī, and Ibn al-Tiqtaqā to ask their creative questions. These four Muslim historians were inspired

¹ Book I, § 2, *ad finem*, and § 3, *ad initium*.

² See III. iii. 138 n. 3.

³ See IV. iv. 307-13.

by the portentous downfall of an Islamic Commonwealth, and three out of the four had personally suffered the shock which had shaken Dār-al-Islām from end to end when Baghdad had been sacked, and the Caliph Musta'sim been put to death, by the Mongol barbarian conqueror Hūlāgū in A.D. 1258. Augustine in his day had lived to suffer the comparable shock administered to all then living citizens of the Roman Empire by Alaric's sack of Rome in A.D. 410;¹ and this harrowing common experience had precipitated a controversy between the pagan and the Christian factions into which the Hellenic body social was divided in this last phase of Hellenic history. The pagans, who had been discomfited in their long struggle with their Christian opponents without having been yet either voluntarily converted or forcibly *gleichgeschaltet*, had seen and taken their opportunity of making capital out of a common calamity for use in their pursuit of a domestic feud. They had insinuated that the cause of Rome's fall in A.D. 410 was to be seen in the antecedent suppression of the rites of the traditional pagan official religion of the Roman Commonwealth through the intolerance of the Christian Roman Emperors Gratian (*imperabat* A.D. 367-83) and Theodosius I (*imperabat* A.D. 378-95).² Was it not to be expected that Rome's tutelary deities would cease to give the Roman Commonwealth their customary protection when their former protégés had ceased to pay them the customary worship that was their due? This tendentious pagan Roman explanation of the fall of Rome in A.D. 410 was the challenge that provoked Saint Augustine—as he has recorded in a passage of his *Reconsiderations*³—to write his own alternative answer to the question: 'What is the cause of this crushing public calamity that has overtaken our world in our time?'

'When we experienced the shock of the disastrous overthrow of Rome through the irruption of the Goths under the leadership of their king Alaric, the "pagan" worshippers of gods who are as false as they are numerous attempted to fasten the blame for this overthrow upon the Christian Religion and took this opportunity to import an unprecedented degree of acerbity and bitterness into their blasphemies against the One True God. This fired me with such zeal for the house of the Lord against blasphemies which were at the same time fallacies that I began to write a treatise *On the Commonwealth of God*.'

As Augustine here states, his initial purpose was to refute the pagans on a controversial issue in the terms in which this issue had been formulated by his adversaries; and, in execution of this purpose, he duly wrote the tract that occupies the first five out of the twenty-two books to which the *De Civitate Dei* was eventually to run.

'The first five books are devoted to a refutation of the thesis that the practice of the pagans' traditional polytheism is a condition *sine qua non* for the assurance of human welfare, and that the prohibition of this cult accounts for the incidence of the sea of troubles that has overwhelmed us.'

This tract, which was the original crystallization-point of Augustine's eventual *magnum opus*, exhibits the forensic ability that was to be expected of a powerful intellect, exercised by a traditional Hellenic train-

¹ See V. v. 223, with n. 2.

² See IV. iv. 226-7 and V. vi. 89.

⁴ *Retractationes*, ibid.

ing in rhetoric, when it had at last found a theme that appealed to the sophist's heart besides commending itself to his head. The author has made some telling points which his pagan opponents might have found it hard to rebut. Would these pagan Romans who insinuate that Christianity has been responsible for Rome's fall be alive today to make this insinuation if, during the sack of the city, they had not stooped to take sanctuary in Christian places of worship? And how was it that they were able to find asylum there? It was because the barbarian conquerors, being converts to Christianity themselves, had voluntarily abstained from despoiling or enslaving any of the conquered population who had sought refuge in Christian fanes. More than that, some of them had even robbed themselves of their legitimate spoils by personally conducting to these voluntarily conceded places of safety the potential victims whom they had encountered in the streets.¹ Had any previous conquerors, barbarian or Roman, ever shown such merciful forbearance in times past?² Or (to make the same point in other terms) had any pagan Hellenic temple ever secured to refugees the effective asylum that had been provided by Christian places of worship in Rome in A.D. 410?³ Why had the Romans ever imagined that Rome would be saved by divinities who had been constrained to migrate to Rome by their failure to save Troy?⁴ And why, if Paganism was the talisman of political and military success, had the devoutly pagan Goth war-lord Radagaisus lost, in marching on Rome, both his war-band and his life, whereas the Christian Goth war-lord Alaric had achieved the sensational success of capturing the Imperial City? Is not the One True God's hand manifest in this signal contrast between the respective fortunes of a pagan barbarian assailant, who would have been merciless to pagan and Christian alike, and a Christian barbarian assailant who showed mercy to pagan as well as Christian refugees in Christian sanctuaries?⁵

This nuclear *De Civitate Dei* is a masterpiece of controversial literature; but its forensic virtuosity would have left the hearts of Posterity cold, when once the artificial literary tradition of an already moribund Hellenic Paganism had become extinct, if the author had allowed the numerous other imperative calls on his time and energy⁶ not merely to interrupt this literary enterprise but to terminate it. Happily Saint Augustine found himself unable to answer the controversial question raised by the dispute over the cause of the fall of Rome without being led into asking other questions. In the first place, his intellectual integrity forbade him to reply to the particular school of pagan Hellenic thought which had indicted the Christian Church without also dealing with a different pagan doctrine that was inconsistent with a belief in the efficacy of the pagan divinities' protection yet was equally incompatible with a Christian theology; and, in pursuit of this second battalion of pagan adversaries, Augustine was led into writing a second batch of five books to supplement his first essay.

⁴ *Op. cit.*, Book I, chap. 3.

⁵ *Op. cit.*, Book V. chap. 23, quoted in V. v. 224-5.

⁶ See *Retractationes*, *ibid.*

'The five books that follow [i.e. Books VI–X inclusive] argue against a thesis in which the practice of Polytheism is likewise defended in spite of its being conceded in this alternative pagan doctrine that troubles such as we have experienced have never failed, and never will fail, to beset Mankind, and that the variations in the severity of the incidence of these troubles are attributable to differences of place, time, and personality. The doctrine against which I argue in this part of the work is that a Polytheism expressing itself in rites of sacrifice has its utility for a life after Death, though not for our life in This World.'¹

In this second instalment of the *De Civitate Dei*, Augustine has thus exceeded the limits of the initial question that had been set for him by his pagan adversaries. After asking himself 'Is it because Rome has ceased to be pagan that Rome has come to grief?' he has gone on to ask himself: 'Can a Paganism which has failed to prove its mundane utility prove that it has any greater utility for an after life?' And, if he had come to a halt after he had given his answer to this second question, his work might have been remembered as an interesting critique of a pair of varieties of pagan Hellenic religious experience. Indeed, considering that these two varieties, between them, cover virtually the whole gamut of Hellenic Paganism, Saint Augustine, in arriving at the end of his tenth book, would have given a substantially complete Christian answer to the question: 'What was this pagan Hellenic way of life that has suffered such dire disaster in our day?' Manifestly this is a far larger and more momentous question than the controversial issue raised in the forensic debate which had originally moved the combative Numidian apologist for Christianity to take up his powerful pen; but Augustine's second question was pregnant with a third; and this ultimate question, which is the subject of the last twelve books of the *De Civitate Dei* out of the eventual total of twenty-two, is the theme that has given Augustine's great work not only its title but its immortality.

After asking himself 'What was this mundane commonwealth that has fallen?' Augustine has risen to the height of the implicit consequent question: 'What is this other commonwealth that remains standing now that the mundane commonwealth has bitten the dust?' And thus the Christian theologian-historian's 'obstinate questionings'² have opened up to him, at the end of his long quest, the vision of a glorious Commonwealth of God which is living in two spiritual dimensions simultaneously. In the flow of Time it is living by faith while it is running the gauntlet of the ungodly on its earthly pilgrimage; and in the stability of its eternal home, for which it is now waiting with patience³ 'until Righteousness turn again unto Judgement',⁴ it is already participating in God's own peace and felicity.⁵ We need not enlarge here upon Saint Augustine's conception of the relations between the Mundane and the Supra-Mundane Commonwealth; for we have touched upon it already in another context,⁶ and no summary by an alien hand can dispense a reader from going to drink at the fountain-head. In this place we have

only to observe that, in passing to the second part of the *De Civitate Dei* from the second instalment of the first part, Saint Augustine is being carried by the Human Mind's impulse to investigate the relations between the facts of History into embarking on the Human Heart's quest to find a meaning behind them.

A Twentieth-Century Western Student of History

The intellectual histories of no less than eleven out of the thirteen historians whom we have just been passing in review¹ indicate that shocking public events are apt to be fecund of intellectual inspirations for historians. On this showing, the generation into which the writer of this Study had been born in a post-Modern Western World could not plead that its own social milieu had been uncondusive to historical thought; and the writer himself could testify (if he might venture once again to draw upon the only first-hand experience at his command) that, by the time when he found himself in his sixty-fourth year, the subjects for at least nine historical works of diverse ranges had been presented to him by questions arising from catastrophic events that he had lived to witness.

An historian born in A.D. 1889 who was still alive in A.D. 1952 had indeed already heard a long peal of changes rung on the historian's elemental question 'How has this come out of that?' How, first and foremost, had it happened that he had lived to see the immediately preceding generation's apparently reasonable expectations so rudely disappointed? In liberal-minded middle-class circles in democratic Western countries in a generation that had been born round about the year A.D. 1860, it had seemed evident by the close of the nineteenth century that a triumphantly advancing Western Civilization had now carried human progress to a point at which it could count upon finding the Earthly Paradise just round the next corner. This *fin-de-siècle* liberal Western hope had been a secularized version of Christ's promise in the Gospels: 'Verily I say unto you that there be some of them that stand here which shall not taste of death till they have seen the Kingdom of God come with power.'² How was it that this hapless generation had lived to see, instead, not the second coming of the Son of Man, but the advent of Antichrist? What fell miscarriage had overtaken the world-wide and perpetual peace that had been confidently augured in A.D. 1851 at the opening of a Great Exhibition in London and had then apparently been achieved twenty years later, after the end of the Franco-Prussian War of A.D. 1870-1? How had this peace come to be shattered in A.D. 1914 and A.D. 1939 by the successive explosions of two world wars in one lifetime? How had the twentieth century of the Christian Era come to see the eighteenth century's 'laws of civilized warfare' thrown to the winds? How had Human Nature prevailed upon itself to perpetrate the atrocities which Turkish hands had committed against the Armenians, and German hands against the Belgians, the Jews, the Poles, and all their other victims? Such

¹ These eleven are Clarendon, Procopius, Josephus, Thucydides, Rhodes, Polybius, Ibn al-Tiqaqā, 'Alā-ad-Din Juwayni, Rashid-ad-Din Hamadāni, Herodotus, Saint Augustine.

² Mark ix. 1. Cp. Matt. xvi. 28 and Luke ix. 27.

wickedness, if not incompatible with Human Nature, was at least irreconcilable with a Western Civilization's moral heritage from Christianity; and, if Turkish atrocities could be explained as anachronistic outcrops of a residual savagery in the hearts of recent proselytes to a Western way of life, how was a Western historian to explain the apostasy of Germans who were native-born children of the Western household? How, through this welter of war and crime, had the political map of the *Oikoumené* come to be changed beyond all recognition? How had the Ottoman Empire, the Danubian Hapsburg Monarchy, and the British Rāj in India come to be replaced by a litter of successor-states? How had the number of the Great Powers in a Western World come to be reduced, within a period of thirty-two years, from the figure of eight at which it had stood at the outbreak of a First World War in A.D. 1914 to the figure of two at which it stood at the close of a Second World War in A.D. 1945? How was it that these two survivors, the Soviet Union and the United States, were, both of them, located outside Western Europe? How had this West European peninsula of Asia, which had dominated the entire *Oikoumené* for 231 years ending in A.D. 1914, come, by A.D. 1945, to be dwarfed by an outer ring of new countries conjured into life by West European enterprise? How had distance come, for human purposes, to be annihilated by the invention of the art of flying? And how had Mankind's conquest of the Air come to be enslaved to the service of a subsequently invented atomic weapon which threatened to annihilate the Western Civilization and perhaps Life itself on this planet?

Here were contemporary themes enough to occupy the time, energy, and genius of all those eleven great historians in our catalogue who, in other times and places, had been moved to show their mettle by the challenge of questions similarly presented by the history of their time; and the writer was aware that, if he had not had an Hellenic classical education, he might have been tempted into expending his stock of intellectual ammunition on an attack upon one or other of the historical targets that had been offered to him and his contemporaries by their own social milieu in their own day. The disappointment of his elders' secularized messianic expectations might have moved a twentieth-century Western historian to study the history of the quest for an Earthly Paradise upon which the Western Society had embarked towards the end of the seventeenth century of the Christian Era in its recoil from the Early Modern Western Wars of Religion. The shattering breach of the forty-three years' peace (*duraverat* A.D. 1871-1914), which had resulted in the dwarfing of Western Europe and the polarization of military and political power in the World round two non-European centres, might have moved him to study the history of a Modern Western Balance of Power. The atrocities committed by Turkish hands against Armenian victims in A.D. 1915-16 might have moved him to study the history of the effects of an impact of Western technique, institutions, ideas, and ideals—particularly the exotic Western ideal of nationally homogeneous parochial states—upon the geographically intermingled Islamic, Eastern Orthodox Christian, and Monophysite Christian societies. The German people's apostasy from the secularized faith of a Modern Western Civilization might have

moved him to study the peculiarities in the ethical development of the German contingent in the Western Society since the Thirty Years War and also the weaknesses in the ethical development of a Late Modern Western Society which had purchased religious toleration at the price of dis severing Christian ethics from their historical roots in the soil of Christian beliefs. The break-up of the Ottoman and Hapsburg empires and the British Rāj might have moved him to devote his working life to a dissection of the political anatomy of one or other of these three polities. The conversion of the 'temperate and undecisive contests' of Gibbon's day¹ into wars of annihilation by the conquest of the Air and the splitting of the Atom might have moved him to study the history of the human consequences of the technological triumphs of a Late Modern Western science.

Thanks to his professional good fortune in being born into a Time of Troubles that was, by definition, an historian's golden age, the present writer was, in fact, moved to interest himself in each of these historical questions that were flung at him by current events; but his professional good fortune did not end here; for he had also been as fortunate as Turgot in his education. Like Turgot, he had been born into a civilization that had not sprung straight from the primitive level but was affiliated to a predecessor of its own species; and in England in A.D. 1896-1911, as in France in the mid-eighteenth century, the Western middle class not only recognized its Hellenic cultural heritage but set so high a value upon this spiritual heirloom that it made the Greek and Latin classics the staple medium of its higher education. Born, though he was, 162 years later than the great French historian civil servant, the writer, happening also to be born in an intellectually more conservative Western country, had been born just in time to receive in England a there then still undiluted Early Modern Western education in Hellenism. By the summer of A.D. 1911, when he had been studying Latin for nearly fifteen years and Greek for more than twelve, the languages, literature, history, and *êthos* of the Hellenic Civilization had become, as they were to remain, more familiar, and far more congenial, to him than any cultural treasures that his own native post-Hellenic society had to offer him; and this traditional education had the wholesome effect of rendering its recipients immune against the malady of corporate self-worship in the insidious form of cultural chauvinism. An Hellenically-educated Westerner could not easily fall into the error of seeing in Western Christendom the best of all possible worlds, nor, *a fortiori*, into the grosser error of equating a post-Western Christian Civilization with 'Civilization' *sans phrase*;² and no Hellenically-educated Western historian could consider the historical questions that his own contemporary Western social milieu was putting to him without referring them to the oracles of a Hellas in which he had found his spiritual home.

To illustrate this intellectual consequence of an Early Modern Western classical education from the cases in point, the present writer

¹ Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, 'General Observations on the Fall of the Roman Empire in the West', in chap. xxxviii, *ad finem*.

² The misconception of 'the Unity of Civilization' has been examined in I. i. 149-71.

could testify that he was unable to observe the disappointment of his liberal-minded elders' expectations without being reminded of Plato's disillusionment with a Periclean Attic democracy. He could not live through the experience of the outbreak of war in A.D. 1914 without realizing that the outbreak of war in 431 B.C. had brought the same experience to Thucydides. As he found his own experience revealing to him, for the first time, the inwardness of Thucydidean words and phrases that had meant little or nothing to him before, he realized that a book written in another world more than 2,300 years ago might be a depository of experiences which, in the reader's world, were only just beginning to overtake the reader's own generation. There was a sense in which the two dates A.D. 1914 and 431 B.C. were philosophically contemporaneous with one another;¹ and this philosophical truth was manifestly more significant than the arithmetical fact that the two dates happened to be 2,345 years apart on a chronological chart. Moreover, when the Hellenically-educated Western historian lived on to see war break out again in A.D. 1939, he could not taste this less shocking, but more harrowing, repetition of the experience of A.D. 1914 without being reminded that Thucydides' Great Atheno-Peloponnesian War had likewise taken the form of a tragedy in two acts separated by an interval of illusory peace, and that the Great Romano-Punic War of 264-201 B.C. and Great Romano-Persian War of A.D. 572-628 had each, again, been a double war on the Thucydidean pattern.² At the crisis of the first World War in the spring of A.D. 1918, when his country's fate had trembled in the balance, the poetry that had kept running through his mind had been no English verse; it had been the lines in which Lucretius had conveyed the indelible impression that had been made on Roman minds by Rome's dire struggle with Hannibal,

ad configendum venientibus undique Poenis
omnia cum belli trepido concussa tumultu
horrida contremuere sub altis aetheris oris.³

When he felt the shock and bewilderment that every non-German Western soul was bound to feel when faced with the portent of the Germans' apostasy from a common Western Civilization, he found himself reminded of the apostasy of Tiglath Pileser III's Assyrians from a Babylonian civilization that Assyria had previously shared with the Babylonians, Elamites, and Urartians—a moral catastrophe whose social consequences had given the Hellenes their opportunity to contend with the Iranians for an hegemony over devastated Babylonian, Syriac, and Egyptian worlds. When he studied the appalling communal conflicts in a contemporary Turkey, Palestine, India, South Africa, and United States, he was reminded of such grim episodes in the history of a post-Alexandrine Hellenic World as Mithradates' massacre of Roman citizens and protected persons in Asia Minor in 88 B.C. and the extermination of Hellene and Jewish local minorities by Jewish and Hellene local majorities throughout Syria upon the outbreak of the Great Romano-Jewish

¹ The philosophical contemporaneity of all societies of the species known as civilizations has been discussed in I. i. 172-4.

² See XI. ix. 236.

³ Lucretius: *De Rerum Naturâ*, Book III, ll. 833-5.

War in A.D. 66. The foundering of the Ottoman Empire and the Danubian Hapsburg Monarchy in the First World War recalled to his mind the catastrophes of Macedon, the Seleucid Monarchy, and other *peritura regna*¹ that had collided with Rome. The reduction in the number of a contemporary Western World's Great Powers from eight to two within the thirty-two years A.D. 1914-45 recalled the reduction in the number of a post-Alexandrine Hellenic World's Great Powers from five to one within fifty-two years and a quarter (219-168 B.C.).² The dwarfing of Western Europe, in a post-Modern Age of Western history, by a circle of giant Powers that had sprung up around her on the fringes of an expanding Western World, reminded him of the dwarfing of a pre-Alexandrine Hellas, in a post-Alexandrine Age of Hellenic history, by Macedonian successor-states of the Achaemenian Empire, a Carthaginian thalassocracy in the Western Mediterranean, and a Roman Commonwealth in Italy which had found their battlefields in Ionia, the Aegean, Continental European Greece, and Sicily.³

It will be seen that in the present writer's social milieu there were two factors—neither of them personal to himself, but both of them properties of the rock from which he had been hewn—which, between them, had a decisive influence on his approach to a study of History. The first of these factors was the current history of his own Western World in his own lifetime; the second was an Hellenic education that was the precious legacy of a fifteenth-century Western renaissance of Hellenic life and letters. By perpetually interacting with one another, as they did, these two factors worked together to make the writer's view of History binocular. When the historian's elemental question 'How has this come out of that?' was put to him by some current catastrophic event, the form which the question was apt to assume in his mind was not 'How has this come out of that state of affairs in the history of an un-Hellenic Western World in which I am a stranger and a sojourner?'⁴ A current event so seldom failed to evoke a reminiscence of some comparable event in Hellenic history that, in an Hellenically-educated Western historian's mind, the stock form of the question came to be: 'How has this come out of that state of affairs in Western as well as in Hellenic history?' Two divergent forces in the historian's social milieu—current events and an Hellenic education—were thus always simultaneously exerting themselves upon his line of thought, and these divergent forces found their resolution in his mind in a habit of looking at History as a series of comparisons in two terms.

This binocular view of History might have been appreciated and approved by Far Eastern contemporaries of the writer's in whose then likewise still traditional education the classical language and literature of an antecedent civilization had played a no less predominant part. The English writer's experience would assuredly have been shared by any Chinese litteratus who had been fortunate enough to have completed his education before the abandonment, in A.D. 1905, of the public

¹ Virgil: *Georgics* II, l. 498.

⁴ Psalm xxxix. 12 (14 in *The Book of Common Prayer*). Cp. Hebrews xi. 13.

examinations in the classics which had previously been the obligatory avenue for gaining entry into the Imperial Civil Service. The Confucian litteratus, likewise, would have found himself unable to encounter any passing event without being reminded by it of some classical allusion, reminiscence, or parallel that would have, for him, a greater value and, indeed, perhaps even a greater reality than the post-classical occurrence that had set his mind working on its congenial task of chewing the cud of a familiar Sinic classical lore. The principal difference in mental outlook between this Late Ch'ing Confucian-minded scholar and his Late Victorian Hellenic-minded English contemporary might prove to be that a Chinese born into this generation could still remain content to make his historical comparisons in two terms only, whereas the Late Victorian Englishman, when once he had begun to think historically in two terms, could no longer rest till he had extended his cultural gamut to a wider range.

For a Chinese receiving his traditional classical education at the turn of the nineteenth and twentieth centuries of the Christian Era, it would still be a novel idea that any civilization other than the Sinic and its living Far Eastern successor could be deserving of any serious consideration; for, by this date, little more than half a century had elapsed since the Chinese had had their first experience of finding themselves defenceless against the assaults of 'south-sea barbarians' armed with new-fangled weapons. An invincibly Sinic-minded Chinese contemporary of the writer's might perhaps still have contrived to ignore the existence of any civilizations beyond the two which, between them, had meant everything to his forebears; but a similarly blinkered vision was impossible for any Westerner of the same generation.

It was impossible because, within the last four hundred years, a Western Society which had conquered the Ocean had thrust itself into contact with no less than eight other representatives of its own species in the Old World and the New;¹ and it had since become doubly impossible for Western minds to ignore the existence or to deny the significance of other civilizations besides their own and the Hellenic because, within the last century, these Westerners who had already conquered a previously virgin Ocean had gone on to conquer a previously buried Past. Within the fifty years following Napoleon's arrival at Alexandria, three hundred years after Vasco da Gama's arrival at Calicut, a new Western science of Archaeology had added to the number of the civilizations within the ken of Western minds by disinterring at least four buried civilizations—the Egyptian, the Babylonian, the Sumerian, and the Mayan—and the writer was to live to see this list extended by the rediscovery of the Hittite and Minoan civilizations and the Indus and Shang cultures. In a generation which had acquired this wide historical horizon, a Western historian who had been led by his traditional Hellenic education to make historical comparisons in two terms could not be content till he had converted this dual into a plural. He was bound to go on to

¹ The eight civilizations in question were the Orthodox Christian and its offshoot in Russia, the Islamic, the Hindu, the Far Eastern and its offshoot in Japan, the Central American, and the Andean.

collect, for comparative study, as many specimens as he could find of the species of Society of which the Hellenic Society and the Western Society were merely two representatives. The twenty or thirty specimens collected and utilized in the present Study were the fruits of the field-work which the writer had been moved to carry out when it had dawned upon him that, for a comparative study of History, the intellectual resources within the reach of a Western historian in his day were of an unprecedented richness.¹

When he had thus succeeded in multiplying his terms of comparison more than tenfold, he could no longer ignore a supreme question which his original comparison in two terms had already threatened to raise. The most portentous single fact in the Hellenic Civilization's history was the eventual dissolution of a society whose breakdown had been registered in 431 B.C. by the outbreak of the Great Atheno-Peloponnesian War; and, if there was any validity in the writer's habitual procedure of drawing comparisons between Hellenic history and Western, it would seem to follow that the Western Society, for its part, must at any rate be not immune from the possibility of coming to a similar end in its turn, even though there might be no *a priori* necessity that its history should take, sooner or later, this tragic Hellenic course. The consideration of so dire a possibility could, however, be kept at bay so long as the history of the Hellenic Civilization remained the only other term of comparison in the writer's mental field, since the rules of Logic did not exact the inference of a general and inexorable law of History from a single case which might, after all, perhaps have been a *lusus Naturae*. When, however, a Western student of History had collected as many as twenty-six specimens of societies of the species 'Civilizations' which had duly come to birth, without reckoning in four others which had been abortive, and when he had gone on to observe that, of these twenty-six, no less than sixteen were already dead by the time of writing,² he was bound to infer from this wider range of instances that death was indeed a possibility which confronted every civilization, not excluding the still living society into which he himself happened to have been born.

Haud igitur leti praeclusa est ianua caelo
nec soli terraeque neque altis aequoris undis,
sed patet immane et vasto respectat hiatus.³

What was this 'door of Death' through which sixteen out of twenty-six civilizations within a twentieth-century Western historian's ken had disappeared already? In setting out to answer a question that had thus been forced upon him by an illuminating multiplication of an originally binocular view of History, the writer was led into a study of the breakdowns and disintegrations of civilizations; and through studying their breakdowns and disintegrations he was led on into a complementary study of their geneses and growths.

It will be seen that no less than three influences emanating from the writer's native Modern Western social milieu had worked together to

¹ An attempt to survey this rich field of historical study has been made in I. i. 63-129.

² See IV. iv. 1-2 and XII. ix. 411-12.

³ Lucretius: *De Rerum Naturâ*, Book V, ll. 373-5, quoted in IV. iv. 4.

present him with the set of questions that had moved him to write the present work. The fifteenth-century Italian humanists who had raised the ghost of an extinct Hellenic culture in a post-Hellenic Western Christian World had compelled him to see History in two terms, *more Sinico*. The fifteenth-century Portuguese and Spanish mariners who had brought Western Christendom into touch with all the other living civilizations in the *Oikoumenê*, and the nineteenth-century French and English archaeologists who had disinterred a number of dead civilizations which had not only passed away but had also subsequently fallen into oblivion, had compelled him to break the bounds of a classical outlook by increasing the number of his terms from a bare two to more than twenty. These three goodly companies of creative Modern Western spirits had thus co-operated to educate one of the latter-day heirs of their cumulative intellectual achievements, and his consequent work had been produced under the auspices of these inspired and inspiring Modern Western pastors and masters.

2. *Inspirations from Personal Experiences*

Gibbon

If we now pass on to consider inspirations that have come to historians, not from their social milieux, but from personal experiences, we shall find a classic example in the genesis of *The History of the Decline and Fall of the Roman Empire* from Gibbon's experience at Rome on the 15th October, 1764.

Edward Gibbon's lifetime (*vivebat* A.D. 1737-94) was not barren of historic events. The English historian was thirty-eight years old at the outbreak of the American Revolution and fifty-two years old at the outbreak of the French Revolution; he lived to see his own country involved in no fewer than four wars; and, though he was still a child at the time of the War of the Austrian Succession and its Anglo-Spanish naval prelude (*gerebantur* A.D. 1739-48), he was in the full vigour of his intellectual powers when the Seven Years War (*gerebatur* A.D. 1756-63) and the American Revolutionary War (*gerebatur* A.D. 1775-83) were fought and when the French Revolutionary War broke out (*erupit* A.D. 1792). Yet—though Gibbon elicits a smile from his reader by suggesting that 'the captain of the Hampshire Grenadiers . . . has not been useless to the historian of the Roman Empire'¹—it is patent that neither the Seven Years War nor any other contemporary public catastrophe was the source of Gibbon's inspiration. *L'Essai sur l'Étude de la Littérature* written in A.D. 1758-9, the abortive fragment of a history of the rise of the Swiss Confederation, written (likewise in French) in A.D. 1767-8, and *The History of the Decline and Fall of the Roman Empire*, which he began to sketch out in the rough at least as early as A.D. 1771² and finished writing

¹ *The Autobiographies of Edward Gibbon*, edited by John Murray (London 1896, Murray), pp. 190 (Memoir B) and 401-2 (Memoir D).

² See chap. xxx, n. 86: 'The Count de Buat is satisfied that the Germans who invaded Gaul were the two-thirds that yet remained of the army of Radagaisus. See the *Histoire Ancienne des Peuples de l'Europe* (tom. vii, pp. 87-121, Paris 1772): an elaborate work, which I had not the advantage of perusing till the year 1777. As early as 1771, I find the same idea expressed in a rough draft of the present History.'

in A.D. 1787, as well as the six drafts for an autobiography, written between A.D. 1788 and A.D. 1793, were all inspired by experiences that were personal to the author.

In the *Essai* (begun at Lausanne in March 1758) the language and the subject alike were acknowledgements of a personal debt to the contemporary French current in the stream of a Late Modern Western Society's intellectual activity; and this debt had been contracted by the author as a consequence of one private action of his own and another which this had evoked from his father. Gibbon's father had responded to Gibbon's conversion to Roman Catholicism at Oxford in A.D. 1753 by packing him off to Lausanne to complete his education there in the house of a Calvinist Protestant minister during the years A.D. 1753-8. A personal interest in Swiss institutions, as well as in French ideas, which had been aroused in Gibbon's mind by this five-years-long residence, at an impressionable age, in a French-speaking subject territory (as the Vaud then was) within the miniature empire of the Canton of Berne, explains Gibbon's tentative choice of the history of the Swiss as his next subject, after the publication of the *Essai* in A.D. 1761; and he set to work on his preparations for this second self-assigned task in the summer of A.D. 1765 for personal reasons again. He himself had then just returned to England from his grand tour on the Continent (*peregrinabatur* January 1763-June 1765); and his Lausannois friend Georges Deyverdun had simultaneously arrived in England to spend four consecutive summers (those of the years A.D. 1765-8)¹ with Edward Gibbon at his father's house at Buriton.

"The two historical designs which had balanced my choice were submitted to his taste, and, in the parallel between the revolutions of Florence and Switzerland, our common partiality for a country which was *his* by birth and *mine* by adoption inclined the scale in favour of the latter. . . . The assistance of Deyverdun seemed to remove an insuperable obstacle. The French or Latin memorials, of which I was not ignorant, are inconsiderable in number and weight; but in the perfect acquaintance of my friend with the German language I found the key of a more valuable collection."²

As for *The History of the Decline and Fall of the Roman Empire*, we have Gibbon's own thrice-declared testimony that this was inspired by another personal experience of his which far surpassed all the rest in the fertility of its creative effects.

The failure of contemporary public events to bring into action the creative genius to which Gibbon's *magnum opus* bears irrefutable witness is the more remarkable considering that the historian was in truth (as might have been expected) neither insensitive nor indifferent to the current history of his day. The sureness of his historical intuition was, indeed, displayed in the diversity of his reactions to the divers contemporary public events mentioned above.

He was deeply impressed and gravely perturbed by the French

¹ See Low, D. M.: *Edward Gibbon, 1737-1794* (London 1937, Chatto & Windus), pp. 197-8.

² Gibbon, E.: *Autobiographies*, ed. cit., pp. 275-6 (Memoir C). Cp. pp. 407-8 (Memoir D.)

Revolution; for, though he did not live to see it complete its course, he at once divined that it was an epoch-making new departure in the Western Society's history which sharply challenged the complacent view of a Late Modern Western Civilization's prospects to which he had committed himself so magisterially in *The History of the Decline and Fall of the Roman Empire* in his 'General Observations on the Fall of the Roman Empire in the West' at the end of Chapter xxxviii.¹ But, when the shock thus administered to Gibbon by the French Revolution did overtake him, nearly two years had already passed since he had written the last sentence of his great work; and, though he lived for more than four and a half years after the advent of an earth-shaking mundane apocalypse that had upset his lifelong *Weltanschauung*,² he was not moved by this revolutionary change in his social milieu to embark on any fresh creative intellectual enterprise. After the completion of *The Decline and Fall*, his only noteworthy literary achievements were the six draft autobiographies;³ and, though these fragments are literary masterpieces which rank with *The Decline and Fall* itself as monuments of the writer's inimitable style, their contents are personal reminiscences which ring no new changes on the historian's elemental question 'How has this come out of that?' though they throw a flood of light on the personal circumstances which had led Gibbon to address himself to this question three times within the thirty years A.D. 1758-87.

As for the American Revolutionary War, Gibbon showed his historical discernment here again in dismissing it, together with the Seven Years War, the War of the Austrian Succession, and the foregoing hostilities between Great Britain and Spain, as one of those 'temperate and undecisive contests' that might produce continual fluctuations in the Balance of Power without deserving to be regarded as anything more than 'partial events' which could not 'essentially injure' the Western World's 'general state of happiness'.⁴ This series of wars through which Gibbon had lived between A.D. 1739 and A.D. 1783 had, in truth, been different in kind from the war which he lived to see break out in A.D. 1792; for, as we have observed in another context,⁵ the Western wars of A.D. 1739-83 were the relatively mild aftermath of the Western General War of A.D. 1672-1713, whereas the war that broke out in A.D. 1792 proved to be another general war, comparable in magnitude to the conflict that had been precipitated, 120 years earlier, by the ambitions of Louis XIV.

The failure of the Seven Years War to inspire Gibbon is nevertheless remarkable; for, though his historical insight may have inhibited him from overrating the historical importance of this 'temperate and undecisive' exercise of the European forces, his literary ambition might have tempted him to try to turn a current public event to personal

¹ See XII. ix. 741-57.

² Gibbon finished writing *The Decline and Fall* on the 27th June, 1787; the session of the French States General was opened at Versailles on the 5th May, 1789; Gibbon died on the 16th January, 1794.

⁵ In XI. ix. 252-3 and 255 (Table I).

account, since, at the outbreak of war in A.D. 1756, Gibbon was nineteen years old, and between March 1758 and February 1759, while the war was in progress, his already awakened literary ambition was leading him to write the first of his published works: *L'Essai sur l'Étude de la Littérature*.¹ From the moment when he started writing this juvenile essay till the moment, nearly ten years later, when he broke off work on his second literary project—a history of the Swiss—in the winter of A.D. 1767–8, Gibbon was painfully casting about for subjects with an obvious lack of inspiration which, to a twentieth-century Western historian's mind, was reminiscent of the deplorable attitude prevalent among latter-day candidates for post-graduate degrees in their desperate search for subjects for theses to be offered up to captains of intellectual industry whose fiat was law in the industrialized academic economy of the Western universities in a post-Modern Age.² Gibbon's choice of the histories of Switzerland and Florence as two possible alternative themes on which he might employ his pen had been the sequel to an unrewarding prospector's tour of other arid deposits of possibly metalliferous ore.

In the summer of 1761, after considering the potentialities of Charles VIII's expedition into Italy, Richard I's crusade, the war of King John and the Barons, the Black Prince, a comparison of Titus and Henry V, lives of Sir Philip Sidney or Montrose, he had at last fixed on Sir Walter Raleigh. But in the following summer he felt obliged to drop his hero. He found that he could add little to the existing life by Oldys, poor performance though that might be, while he would hesitate to eke out his work by digressions into contemporary history which had already occupied such men as Walpole, Robertson, and Hume.³

Indeed, from the time when Gibbon had completed his education until the winter of A.D. 1767–8, when, after abandoning the history of the Swiss, 'I more seriously undertook,' as he himself records, 'to methodise the form and to collect the substance of my Roman decay',⁴ he was afflicted with a barrenness of intellectual creative power which he frankly confesses.

'Between [the publication of] my Essay and [the publication of] the first volume of *The Decline and Fall*, fifteen years (1761–1776) of strength and freedom elapsed without any other publications than my criticism on Warburton⁵ and some articles in the *Mémoires Littéraires*.⁶

It is astonishing that, after this long inauspicious prelude, Gibbon should have been continuously occupied, throughout a period of some nineteen and a half years, ending on the night of the 27th June, 1787, in producing a masterpiece of historical research, construction, and writing

¹ See Low, D. M.: *Edward Gibbon, 1737–1794* (London 1937, Chatto & Windus), p. 102.

² This attempt to apply the technique of the Division of Labour to a post-Modern Western World's intellectual activities has been noticed in I. i. 2–8.

³ Low, op. cit., p. 118, mentions three passages, dating from the 14th April, 1761, to the 26th July, 1762, in Gibbon's diary, quoted in *Autobiographies*, ed. cit., pp. 193–7 (Memoir B).

⁵ Gibbon, E.: *Critical Observations on the Sixth Book of the Aeneid* (originally published in 1770, and reprinted in *The Miscellaneous Works of Edward Gibbon Esq.*, new edition, vol. iv (London 1814, John Murray), pp. 467–514).—A.J.T.

⁶ Gibbon, *Autobiographies*, ed. cit., p. 411 (Memoir D). Cp. pp. 283–4 (Memoir C).

which had no superior in its own genre in any literature known to Western scholars in A.D. 1952. It is, however, more astonishing still that, as soon as he had completed this supremely creative piece of intellectual work, Gibbon should have relapsed, for the remaining six and a half years of his life, into the intellectual barrenness from which he had suffered in his youth.

Gibbon did not even produce a final complete version of his autobiography out of his six successive fragmentary drafts; and the new literary enterprise to which he addressed himself between his return from Lausanne to England in the early summer of A.D. 1793 and his death on the 16th January, 1794, had not been his own idea, but had been undertaken at the suggestion of 'a young Scottish antiquary', John Pinkerton, who had audaciously rushed in where Gibbon's defaulting muse had forborne, this time, to tread.¹ A presentiment that this muse was now to desert him as arbitrarily as she had made her epiphany to him on the 15th October, 1764, not much less than twenty-three years back, can indeed be read between the lines of the elegiac passage in which the historian has recorded his feelings after writing the last sentence of his supremely great work.

'It was on the day, or rather the night, of the 27th June, 1787, between the hours of eleven and twelve, that I wrote the last lines of the last page in a summer-house in my garden. After laying down my pen I took several turns in a *berceau*, or covered walk of acacias, which commands a prospect of the country, the lake, and the mountains. The air was temperate, the sky was serene, the silver orb of the Moon was reflected from the waters, and all Nature was silent. I will not dissemble the first emotions of joy on the recovery of my freedom, and, perhaps, the establishment of my fame. But my pride was soon humbled, and a sober melancholy was spread over my mind by the idea that I had taken my everlasting leave of an old and agreeable companion, and that, whatsoever might be the future date of my history, the life of the historian must be short and precarious.'²

Gibbon's gift to his fellow men is indeed all contained in one immortal work which it took him some fifteen years (A.D. 1773-87) to write, some nineteen and a half years (A.D. 1768-87) to produce, including some four and a half years (A.D. 1768-72) spent on systematic study and on preliminary drafting,³ and nearly twenty-three years (15th October, 1764-27th June, 1787) to create, including three years and more during which the already dedicated historian of the decline and fall of Rome 'still contemplated at an awful distance'⁴ the subject that had been vouchsafed to him⁵ by his heavenly visitant on an historic site at a memorable hour in

¹ 'A young Scottish antiquary approached him with a scheme for publishing the English chronicles from Gildas to the accession of the House of Tudor. Gibbon reflected, approved, took fire: he promised first his interest, then his assistance, and finally his collaboration' (Young, G. M.: *Gibbon*, 2nd ed. (London 1948, Hart-Davis), p. 175). 'He agreed to write a general preface and introductions for Pinkerton's projected edition of early English historians' (Low, D. M.: *Edward Gibbon, 1737-1794* (London 1937, Chatto & Windus), p. 345).

circumstances which the recipient of this divine inspiration has recorded in words that rise to the height of the occasion.

'It was on the fifteenth of October, in the gloom of the evening, as I sat musing on the Capitol while the barefooted fryars were chanting their litanies in the Temple of Jupiter,¹ that I conceived the first thought of my history.'²

This imaginative experience, was the sole flash of inspiration with which Gibbon was ever visited. Without it, that wonderful genius might never have come to flower, and that famous name might have found no place in the record of Mankind's intellectual history. In chronological terms the psychic event which had these momentous consequences may have occupied no more than a fraction of one second out of the thirty-six years or so of the great historian's adult intellectual life; yet his watchful muse did not fail to see and seize her fleeting opportunity of gaining access to a mind which was normally rendered impervious to her divine promptings by a carapace of innate scepticism that had been case-hardened in an all too congenial eighteenth-century Western mental climate. Perceiving that her chosen vessel's usually inhibited soul had been momentarily softened by the cumulative emotional influences of a sight which recalled the greatness of a dead Past and a sound whose faintly floating strains conveyed the measure of the gulf between Past and Present, the goddess had made her dazzling instantaneous epiphany from the depths of a Subconscious Psychic Abyss in order to release the springs of a mighty mind's intellectual power by the annunciation of a theme which, at last, was fully worthy of the ready writer.³

'How has this come out of that?' It would be hard to find another instance in which the historian's stark elemental question had generated so fecund a germ of creative thought. The favoured recipient himself did not immediately apprehend more than a fragment of the mental wealth that had suddenly been poured into his lap, and even the incomparably great work that he eventually made of it was no more than a gleaming from the huge potential harvest.

'My original plan', Gibbon tells us,⁴ 'was confined to the decay of the City; my reading and reflection pointed to that aim'; and this project was duly achieved in the essay that eventually found its place as the last chapter of the completed work, in which Gibbon surveys the ruins of Rome in the fifteenth century of the Christian Era and discusses the

¹ The pagan temple that had been replaced by the Christian church of Santa Maria in Arâ Coeli, served by the 'Zoccolanti' Franciscan Friars Minor, was actually the Temple of Juno Moneta, at the northern end of the Mons Capitolinus. The Temple of Jupiter Capitolinus had occupied the south-western end of the hill.—A.J.T.

² *Autobiographies*, pp. 405-6 (Memoir D). This experience is also recorded in two other of Gibbon's drafts for an autobiography. The account in Memoir E (*ibid.*, p. 302) does not differ in any point from that in Memoir D, quoted above. The account in Memoir C (*ibid.*, p. 270) gives 'the place and moment of conception' of *The History of the Decline and Fall* as 'the fifteenth of October 1764, in the close of evening, as I sat musing in [*sic*] the Church of the Zoccolanti or Franciscan fryars, while they were singing Vespers in the Temple of Jupiter on the ruins of the Capitol'. The other two accounts give the impression—though they do not expressly state—that Gibbon was sitting in the open air, with the ruins of Ancient Rome before his eyes, while the sound of the friars' voices was reaching his ears from inside the Christian Church on the site of a former pagan temple.

³ Psalm xlv. 1 (2 in *The Book of Common Prayer*).

⁴ In *Autobiographies*, ed. cit., p. 406 (Memoir D).

causes of the physical decay and destruction of a city which had reached the apogee of its material splendour in the second century. The last words of this chapter, written in the last hour of the 27th day of June, 1787, at Lausanne, nearly twenty-three years after the Muse's epiphany at Rome, are:

'It was among the ruins of the Capitol that I first conceived the idea of a work which has amused and exercised near twenty years of my life, and which, however inadequate to my own wishes, I finally deliver to the curiosity and candour of the public.—Lausanne, June 27, 1787.'

But in the meanwhile the growth of the original germ of thought had kept pace with the passage of Time; for, by the date at which Gibbon indited these closing words, this chapter was numbered, not 'Alpha and Omega', but lxxi. In the course of its elephantine gestation, the germ planted in Gibbon's mind on the 15th October, 1764, had grown more than seventyfold beyond the modest compass of its primal nucleus.

'My original plan was circumscribed to the decay of the City rather than of the Empire; and, though my reading and reflexions began to point towards that object, some years elapsed, and several avocations intervened, before I was seriously engaged in the execution of that laborious work.'¹

The historian goes on to tell us² that he 'had yet a very inadequate notion' of the 'limits and extent' of his theme, even when he did start his serious labours on it in A.D. 1768.

'I gradually advanced from the wish to the hope, from the hope to the design, from the design to the execution, of my historical work. . . . Through the darkness of the Middle Ages I explored my way, in *The Annals and Antiquities of Italy* of Muratori, and compared them with the parallel or transverse lines of Sigonius and Maffei, of Baronius and Pagi, till I almost grasped the ruins of Rome in the fourteenth century, without suspecting that this final chapter must be attained by the labour of six quartos and twenty years.'³

By the 27th June, 1787, this labour had extracted a history of the Decline and Fall of the Roman Empire out of a theme which, on the 15th October, 1764, had been enunciated by the Muse merely as a history of the physical decay of a city that Trajan, Hadrian, and the Antonines had bequeathed to unworthy epigoni. 'How has this come out of that?' The labour of twenty years and six quarto volumes had expanded the field of Gibbon's answer to the historian's elemental question from the *pomoerium* of an imperial city to the *limites* of the universal state of which Rome had been the foundress and first capital; yet, immense though this progressive expansion of Gibbon's historical horizon was, it was prevented from expanding right up to 'the natural frontiers' of even a mundanely intelligible field of study by the narrowness of the original nucleus of the germinating idea.

The tragically dramatic contrast that had fired Gibbon's imagination

¹ Gibbon, E.: *Autobiographies*, ed. cit., pp. 270-1 (Memoir C).

² *Ibid.*, p. 284 (Memoir C).

³ *Ibid.*, p. 411 (Memoir D). Cp. p. 284 (Memoir C).

among the ruins of the Capitol on the 15th October, 1764, had been the physical contrast between these present ruins and the past magnificence of those buildings when they had stood intact; and Gibbon had been right in seeing in the second century of the Christian Era the physical city of Rome's architectural *floruit*. In setting out to trace the history of the city's subsequent physical decay, he had therefore likewise been right in taking the death of Marcus Aurelius and accession of Commodus as his chronological starting-point. He had, however, failed to perceive that the geographical enlargement of his subject from an *Urbs Roma* to an *Orbis Romanus* demanded of him a concomitant extension of his chronological limits. He did not take Bacon's point¹ that the Roman Empire's mission and significance had lain in serving as a universal state for the whole of the Hellenic Society, and that the *orbis* which had been arrogantly styled *Romanus* by citizens of the city-state which had happened to serve as History's instrument for bringing this world into political unity was in truth an Hellenic World whose decline and fall had already been in full train before the rise of Rome had begun, and whose principal pre-Roman polities—Sparta, Athens, Olynthus, Macedonia, and Syracuse—had given Rome her opportunity by failing to solve for the Hellenic Society betimes the political problem that Rome had solved for it eventually too late. The episode of mundane history that had been the implicit theme of Gibbon's flash of inspiration on the 15th October, 1764, was in truth the decline and fall, not just of a Roman Hellenic universal state, but of the Hellenic Civilization itself; and the 'beginning of great evils for Hellas',² in which the historian of the Decline and Fall ought to have found his chronological starting-point, was, not the accession of Commodus in A.D. 180, but the outbreak of the Great Atheno-Peloponnesian War in 431 B.C.³

This was not, however, either the only or the greatest spiritual treasure latent in Gibbon's fecund experience on the Capitol which the subject of the experience failed to harvest. The antiquarian approach which misled Gibbon into entering upon his story at a point more than six hundred years after its true beginning was not so grave a limitation as the sceptical temperament and the eighteenth-century Western bent of mind which inhibited him from apprehending the ultimate theme with which this marvellous revelation was pregnant. The ultimate theme was not a decline and fall of the Hellenic Civilization—occupying a somewhat longer span in the Time-dimension than the decline and fall of that society's Roman universal state after the death of Marcus Aurelius. It was not either this or any other episode of merely mundane history. It was a drama in which the action was raised to a higher spiritual dimension through an invasion of Time by Eternity. The heart of the revelation conveyed by the sound of a Christian liturgical chant impinging on the sight of the ruins of a Trajanic Rome was the truth that Man's mundane failures are seized by God as His hell-sent opportunities for offering to human souls a chance of finding spiritual salvation.⁴

¹ See the passage quoted from Bacon's essay 'Of the True Greatness of Kingdoms and Estates' in VI. vii. 110.

² Thucydides, Book II, chap. 12.

³ This point has been made already in IV. iv. 58-63.

⁴ See II. i. 271-99.

This truth that Man's failure, sin, and suffering in This World may serve Man, through God's grace, as a chariot on whose wings the Soul can soar heavenward¹ is an apocalypse in which History works together with Theology to lift a corner of the veil that shrouds from human vision the mystery of Human Nature and Destiny; for, in giving us an inkling of the good of Evil, this truth gives us a glimpse of the self-consistency and goodness of God's providence.

This is the ultimate meaning of 'the triumph of Barbarism and Religion' which Gibbon, in the closing seventy-first chapter of his work, claims to have described in the seventy chapters that precede it; and it is a meaning that had been duly divined by a Roman in whose person 'Religion and Barbarism' appeared, to Gibbon's unsympathetic eye, to be repulsively combined.² Not much less than twelve hundred years before the date of Gibbon's experience, Saint Gregory the Great, preaching a sermon to his Roman flock in the selfsame physical surroundings, had perceived and proclaimed the hollowness of this Trajanic Rome's outward grandeur;³ and on the 15th October, 1764, Gibbon's visitant muse must have been fain to convey the Christian saint's inspiration to the post-Christian historian; for this visitant was a greater spiritual power than the Clio in whose garb she had presented herself in order to put her would-be chosen vessel to the test. Gibbon had in truth been visited in that ineffable moment by the Hokmah—God's Holy Wisdom⁴—who had once been recognized unerringly for what she was by the physically blind eyes of an English poet when his unquenched voice had hailed her as 'offspring of Heaven first-born'.⁵ But Gibbon's heart had not known how to respond to the epiphany of this Celestial Light with Milton's prayer:

Shine inward, and the mind through all her powers
Irradiate, there plant eyes, all mist from thence
Purge and disperse, that I may see and tell
Of things invisible to mortal sight.

Instead of asking the historian's elemental question 'How has this come out of that?' with the spiritual humility that would have allowed his answer to expand to the full measure of its potential dimensions, the

¹ See II. ii. 210, n. 1; VII. vii. 420-9; and XII. ix. 627.

² Gibbon's treatment of Gregory the Great is a monument of the historian's virtuosity in the unamiable art of bestowing praise in terms that are more devastating than a candid censure:

'The pontificate of Gregory the Great . . . is one of the most edifying periods of the history of the Church. His virtues, and even his faults, a singular mixture of simplicity and cunning, of pride and humility, of sense and superstition, were happily suited to his station and to the temper of the times. . . .

'Experience had shown him the efficacy of these pompous rites. . . . and he readily forgave their tendency to promote the reign of priesthood and superstition. . . .

'The most abject ideas must be entertained of their [the sixth-century Italians'] taste and learning, since the epistles of Gregory, his sermons, and his dialogues are the work of a man who was second in erudition to none of his contemporaries.'

These are three fair samples of the laudatory arrows with which Gibbon has nailed his mighty victim to his sarcastic page in the forty-fifth chapter of his work.

³ Saint Gregory the Great: *Homiliae Quadraginta in Evangelia*, No. xxviii (Migne, J. P.: *Patrologia Latina*, vol. lxxvi, col. 1212), quoted in IV. iv. 60-61.

⁴ See Meyer, E.: *Ursprung und Anfänge des Christentums*, vol. ii (Stuttgart and Berlin 1921, Cotta), pp. 104-5; Dodd, C. H.: *The Bible and the Greeks* (London 1935, Hodder & Stoughton), pp. 217-18.

⁵ Milton: *Paradise Lost*, Book III, l. 1.

self-assured child of a post-Christian Western secular enlightenment cramped the fruitful question from the outset by introducing into it a specious qualification. 'How on Earth has this come out of that?' was the form in which Gibbon recast, in his own style, the question that had been planted in his mind by its heavenly visitant; and, in thus automatically ruling the supra-mundane dimension of Reality out of his reckoning, he was unconsciously precluding himself from finding the treasure hid in his field,¹ though he sifted the soil with a diligence that could hardly have been surpassed by a twentieth-century Western archaeologist.

Volney

This personal experience of which Gibbon made so much or made so little, according to the standard by which we measure his achievement, was, of course, in any case not unique. We have already taken note² of the comparable personal experience that inspired Gibbon's younger contemporary Volney (*vivebat* A.D. 1757-1820) to write *Les Ruines, ou Méditations sur les Révolutions des Empires*; and, though Volney's tale of a visitation that overtook him while he sat musing on a fallen column among the ruins of Palmyra³ may be apocryphal, there can be no doubt that this myth, if such it is, is a literary artifice for conveying a genuine experience. Volney on his travels in Egypt and Syria, like Gibbon on his visit to Rome, was inspired to write a great work on human affairs by a personal experience of a dramatic contrast between a miserable Present and a magnificent Past; and the inspiration that he had received *en voyage* in A.D. 1783-5 bore fruit in the publication of *Les Ruines* in A.D. 1791,⁴ as Gibbon's inspiration *en voyage* in A.D. 1764 had borne fruit in the publication of *The History of the Decline and Fall of the Roman Empire* between A.D. 1776 and A.D. 1788.

Peregrinus Wiccamicus

The writer of the present Study had an authentic minor personal experience of the kind on the 23rd May, 1912, as he sat musing on the summit of the citadel of Mistrà, with the sheer wall of Mount Taygetus bounding his horizon in the western quarter of the compass, towards which he was bound, and the open vale of Sparta stretching away in the opposite eastern quarter, from which he had made his way that morning.

Though he had sat there, musing and gazing (and prosaically taking the edge off his hunger by consuming slabs of Pavlidhis' chocolate) through most of a long summer's day, till the gloom of evening constrained him reluctantly at last to move on in search of supper and a bed at Trýpi, he cannot pretend that he was inspired during his reverie on the summit by any strains from the throats of the nuns serving the church

¹ Matt. xiii. 44.

² See *Les Ruines*, chaps. 1-4.

³ Volney's fortuitous chronological advantage over Gibbon in being his junior by twenty years enabled him to profit mentally by a public catastrophe from which his senior had proved unable to derive any intellectual inspiration. The outbreak of the French Revolution, which had devastated Gibbon, stimulated Volney to bring the fruits of his Levantine experiences to harvest—though he had to pay for this stimulus by spending the last ten months of the Terror as a prisoner in irons.

⁴ On pp. 7-8, above.

of the Pandánassa, for he had left this far below in his spiral ascent of the miniature purgatorial mount that the citadel crowned like a Dantean Earthly Paradise. The sensuous experience that activated his historical imagination was not a sound of liturgical chanting; it was the sight of the ruins among which he had wound his way upwards to the peak; and this spectacle had been appalling; for, in this shattered fairy city, Time had stood still since that spring of A.D. 1821 in which Mistrà had been laid desolate, and in the spring of A.D. 1912 the nuns (rare birds in a Greek Orthodox Christendom) were the solitary inhabitants of a *kástro* that, for some six hundred years ending in the final catastrophe, had been the capital of Laconia under a series of successive régimes. Founded by the Franks *circa* A.D. 1249, recovered by the Byzantines in A.D. 1262, conquered by the 'Osmanlis in A.D. 1460, wrested from Ottoman hands by the Venetians in A.D. 1687,¹ and recovered by the 'Osmanlis in A.D. 1715, Mistrà had continued, through all these political, religious, and cultural vicissitudes, to reign for those six hundred years as the queen of the broad landscape that could be surveyed from her topmost battlements; and then, one April morning, out of the blue, the avalanche of wild highlanders from the Máni had overwhelmed her; her citizens had been forced to flee for their lives and had been despoiled and massacred as they fled; her deserted mansions had been sacked; and her ruins had been left desolate from that day to this.

Gazing across the plain which stretched away from this ruined hill-town's foot to her trim and respectable lowland successor near the banks of the Eurotas where he had passed the previous night, and reading in the guidebook in his hand that 'the present Sparta . . . founded in A.D. 1834 under King Otho after the War of Independence . . . is of entirely modern origin',² he was convicted of a horrifying sense of the sin manifest in the conduct of human affairs. Why should this lovely medieval eyrie have to be put to the sack in order that a commonplace modern townlet might be laid out on a different site to serve the selfsame public purpose?³ The history of Laconia between A.D. 1821 and A.D. 1834 had been a typical sample of human history in general. *Quam parvâ sapientiâ mundus regitur!*⁴ A Gibbon might well find it difficult to decide whether Man's most damning vice was his brutality or his irrationality.

Needless to say, the writer of this Study had made no progress towards reading the cruel riddle of Mankind's crimes and follies by the time

¹ See Hammer, J. de: *Histoire de l'Empire Ottoman*, French translation, vol. xii (Paris 1838, Bellizard, Barthès, Dufour, et Lowell), p. 227.

² Baedeker, K.: *Greece*, 4th revised edition (Leipzig 1909, Baedeker). This old campaigner, which had been in the writer's hand at Mistrà on the 23rd May, 1912, was on his table in London on the 31st May, 1951, while he was writing these words.

³ Even now, when it is abandoned to the tortoises and the sheep, the hill of Mistrà looks down, as it were, with feudal pride upon the brand-new streets and hideous cathedral of the modern Sparta'.—Miller, W.: *The Latins in the Levant* (London 1908, John Murray), p. 100.

⁴ Bureaucracy had completed in cold blood the work of destruction that had been started in hot blood by war. 'The government of King Otho having transferred the residence of the official authorities to the new town of Sparta, the inhabitants of Misithra have followed, and the town of the Frank princes is sinking into a village'.—Finlay, G.: *A History of Greece from its Conquest by the Romans to the Present Time*, new ed., vol. iv (Oxford 1877, Clarendon Press), p. 198.

⁵ Axel Oxenstierna, quoted in I. i. 463, n. 2.

when he was forced down from the heights of Mistrà by the twofold pressure of hunger and nightfall. Yet, before his reluctant descent, the binocular historical vision which he had acquired from a Late Medieval Italian classical education at Winchester and Oxford had won from the Laconian landscape an intuition that was the germ of the present work.

As he brooded over the catastrophe through which a Sparta founded under the auspices of a Bavarian king of Greece had usurped the role of a Mistrà that had been founded by a French prince of the Morea, it was borne in upon him that the nineteenth-century performance of this historical tragedy was not the only one within his knowledge. After all, every Western schoolboy knew that the present town of Sparta was not the first to have occupied that site and borne that famous name; and, indeed, only yesterday the dreamer himself had been taking cognizance of one corner of an Hellenic Sparta which had recently been excavated by other members of the British Archaeological School at Athens. 'Dorian' hands had anticipated Modern Greek hands in founding 'the city on the sown-land' (*spartâ*) at some date perhaps little less than three thousand years earlier than A.D. 1834. But if the history of a latter-day Western Society into which the Modern Greeks had forced their way out of an Ottoman prison-house was an antitype of the history of an antecedent Hellenic Civilization—and this was the aspect in which the Western Society's history presented itself to an Hellenically-educated Western mind—then the Hellenic Sparta that was the historic counterpart of the present city in the plain must be presumed to have been preceded by some pre-Hellenic counterpart of the Frankish and Ottoman Mistrà on whose topmost pinnacle the latter-day Western classical scholar was at this moment perched. An Hellenic Sparta's fortunes must have been founded on some previously regnant hill-town's catastrophe.

Had Hellenic Sparta in truth had such a predecessor? And, if so, where was the hill on which this hapless victim of that Hellenic Sparta had been set? 'A city that is set on a hill cannot be hid'.¹ 'I will lift up mine eyes unto the hills, from whence cometh my help';² and, raising his eyes as these texts shot through his mind, the gazer saw staring him in the face, on the crown of the bluff that overhung the farther bank of the Eurotas just opposite the all but coincident sites of Sparta the First and Sparta the Second, a monument that signalled to him the location of the pre-Hellenic counterpart of the Frankish and Ottoman citadel over whose battlements he was looking out. That white masonry that was flashing over there like a heliograph in the sunlight was 'the Mene-laïon' to which he had hastened to make his pilgrimage upon his arrival at Sparta three days back; and this ruined shrine was reputed to stand on the site of Therapnê, the hill-city that was said to have been the capital of Laconia in a Mycenaean last phase of Minoan history. Here, at a strategic point equivalent to Mistrà's situation on the opposite side of the vale, had stood Frankish Mistrà's pre-Hellenic double whose overthrow had made the first Sparta's fortune; and the historic tragedy of Mistrà had thus in truth been played at least twice in this rock-bound amphitheatre of everlasting hills.³

¹ Matt. v. 14.

² Psalm cxxi. 1.

³ Gen. xlix. 26.

Before the gazer descended from Mistrà that night, the impact of the Laconian landscape on his classical *Weltanschauung* had impressed on his mind two lasting lessons—one concerning the historical geography of Continental European Greece and the other concerning the morphology of the history of civilizations.¹

He had learnt that, in this Mediterranean peninsula, the physical environment lent itself to two possible alternative social and political régimes which had in fact alternated with one another here at least twice over. The lie of the land and the set of an insinuating sea had decreed that in this country there should be a perpetual tug-of-war between the shepherds in the highlands which covered all but a fraction of the *terra firma* and the husbandmen, artisans, and mariners in the fruitful patches of plain and in the profitably situated ports; and the fluctuations in a perpetual struggle between these two elements in the population, who divided the territory so unevenly between them, were bound to be reflected in corresponding fluctuations in the fortunes of geographical sites and in the currency of political institutions. When the seafaring and farming population of the ports and plains was on the defensive—as it was apt to be particularly when it consisted of alien intruders who had thrust their way in from overseas—it could do no more than maintain a precarious hold over the plains, and over the passes leading from one plain to another, from fortified eyries. One such eyrie had been planted on the pinnacle of Mistrà by Frankish invaders in the thirteenth century of the Christian Era, and another on the bluff at Therapnè by Minoan invaders in the second millennium B.C., and the eventual catastrophe in which both these variations on the same historical theme had ended was manifestly the denouement that was to be expected from the inherent insecurity of this type of régime.

The exotic castle might pass, time and again, from one set of alien hands to another—as Mistrà had passed through French, Byzantine, Ottoman, Venetian, and, once again, Ottoman hands, and Therapnè through Cretan, Pelopid, and Achæan—but, sooner or later, the *tour de force* was likely to end in the same way. The perilously exposed outpost of an alien civilization would be overwhelmed by a social cataclysm in which the native wild highlanders, who had been kept at bay by the intruders without ever being either subjugated or assimilated, would descend upon the plains in a devastating spate; and this recurrent catastrophe, whenever it occurred, would be apt to result in a *peripeteia* that would inaugurate a spell of the alternative régime. For, when once the native highlanders had thus possessed—or repossessed—themselves of the plains, the ports, and the passes, their children would come to adopt the corresponding agricultural and maritime way of life without ceasing to be a match in warfare for their cousins who had stayed among the mountains to continue there to pursue the highlanders' two traditional avocations of shepherding and brigandage.² In contrast to the

¹ These two lessons implicit in the historical geography of Laconia have been noticed already in IX. viii. 491-5.

² In Macedonia, where the social *peripeteia* accompanying a transfer of sovereignty from the Ottoman Empire to the Kingdom of Greece had taken place ninety-one years later than in Laconia, the writer once had the good fortune to obtain a vivid sidelight on

alien intruders from overseas, the native highlanders who had ousted them from the plains, and who, in consequence, had taken to husbandry, manufacture, and seafaring, would have it in them to break the residual wild highlanders' spirit; and the visible symbol of the effective ascendancy that, under this indigenous régime, would be established over conservative highland shepherds by *ci-devant* highlanders who had now become lowlanders and husbandmen, would be the replacement of a fortified citadel of Therapnê or a fortified citadel of Mistrà by an open city on 'the sown-land'—a Sparta that could dispense with city-walls because the martial prowess of her disciplined citizen soldiers would have effectively struck terror into the cowed surviving highlanders' hearts.¹

This lesson in the historical geography of Greece which the writer had learnt on the citadel of Mistrà on the 23rd May, 1912, had been treasured by him ever since; yet it had not proved so valuable for his then still unconscious future purposes as the simultaneous lesson in the morphology of the history of civilizations. A notion of the philosophical contemporaneity and philosophical equivalence of chronologically non-contemporary representatives of this species of Society had, it is true, been implanted in his mind by his Hellenic classical education,² and this tentative idea was to be ripened into conviction, little more than two years later, by the light that was to be thrown for him upon the vocabulary and the psychology of Thucydides by the outbreak of a First Western World War.³ Yet these influences from the social milieu into which a classically-educated post-Modern Western historian had been born might not have availed, by themselves, to initiate him into a synoptic view of History if this synoptic view had not unfolded itself physically before his eyes from the summit of Mistrà on the 23rd May, 1912, in an experience that had been personal to the spectator.

Yosoburo Takekoshi

An experience that is personal in the sense of not being imparted by the subject's social milieu may also inspire an historian even when he experiences it at second-hand—as is attested by a twentieth-century

it from a living beneficiary. Waiting for an omnibus at Sorovich on the 4th September, 1921, he fell into conversation with a bystander who turned out to be a Slovene, born in Klagenfurt, Carinthia, who had emigrated as a boy to the United States, had come to Macedonia as a chauffeur for the American Red Cross, and was now driving a tractor in the service of three Greek brothers who were joint owners of a large estate in the neighbourhood of Sorovich, besides owning a whole block of houses just across the road from the railway station. Like the property itself, the present owners' up-to-date Western method of farming was a legacy from their father, who had died only four months since. In answer to a question about his enterprising deceased employer's antecedents, the Slovene mechanic volunteered: 'Well, he hadn't owned this property for very long. Before "the war" [meaning the Balkan Wars of A.D. 1912-13], when the Turks owned the land, he was just one of those "Christians"—what is the English word for them? . . . O, now I remember it: "brigands"—up in the mountains. But, when the Greek Army marched in, the Turks cleared out and the brigands came down from the mountains and seized the land. So that is how my employer got his property, and how I got my job.'

¹ This is perhaps the answer to a question that has been raised by a Modern Western historian. 'One wonders, on visiting Villehardouin's castle to-day, how the Ancient Spartans can have neglected a strategic position so incomparably superior to their open village down in the plain by the Eurotas.' Miller, W.: *The Latins in the Levant* (London 1908, John Murray), p. 100.

² See pp. 93-95, above.

³ See p. 94, above.

Japanese historian, Yosoburo Takekoshi, in his preface to his book *The Economic Aspects of the History of the Civilisation of Japan*.¹

'When Viscount Motono, who was Japanese Ambassador in Paris between 1901 and 1906, met Monsieur Gustave Le Bon, a distinguished evolutionist, the latter referred to the recent rise of Japan as marvellous and unparalleled in the World's history, and compared her progress to that of a comet which flashes across the sky, but pursues an irregular orbit, is dangerous to approach, and [is] extremely uncertain as to its appearance and disappearance. Japan, he further commented, like the comet, may some day abruptly pass away from sight yonder beneath the horizon. In reply, Viscount Motono pointed out that Japan had not appeared on the sky with any such abruptness as Monsieur Le Bon appeared to think; that, on the contrary, she had, through her long history, passed through various stages of progress till finally she emerged on the stage of the World's theatre fully prepared and ready to play her part. Her rise had only followed its natural course. Monsieur Le Bon thereupon urged the publication of a work dwelling upon Japan's progress; and, when subsequently Viscount Motono was home on leave, he told me of his interview with Monsieur Le Bon, and suggested that I should write a Japanese history to enlighten not only Monsieur Le Bon himself but many others in Europe who might entertain a similar idea regarding Japan.'

This suggestion of Viscount Motono's, arising out of his account of his conversation with Le Bon, duly sowed in his interlocutor's mind the seed of an intellectual enterprise which was retarded, without being choked, by the thorny political career in which the future author of the suggested work was involved for the next nine years or more. As soon as Yosoburo Takekoshi had been compulsorily discharged from political life through his failure to retain his seat in the Japanese Diet at the General Election of A.D. 1915, he took up in earnest the long delayed project and completed it in the course of the five years ending on the 25th November, 1920, when he wrote the preface in which he has recorded the book's genesis. The muse's part in this case had been played neither by a catastrophic public event nor by a poignant personal experience at first-hand, but by a report of a personal encounter between two other living minds.

D. THE FEELING FOR THE POETRY IN THE FACTS OF HISTORY

IN our foregoing inquiry into the impulse to investigate the relations between the facts of History, we have struck the springs of action of a number of historians. Some of those springs prove to have been released by personal experiences and others by events or circumstances in an historian's social milieu, while the historians whom we have constrained to abide our question have ranged in repute from the most eminent to the most obscure. This variety in the evidence which we have cited in dealing with one subject on our agenda gives point to the remarkable concordance of these divers witnesses' incidental uninvited testimony on our next subject. Our survey of responses to the challenging intellectual question 'How has this come out of that?' reveals in retrospect the significant truth that, in their attempts to answer it, historians have been drawn on to go deeper and to look farther.

When we are investigating the relations between the facts of History, we are trying to see God through History with our intellects. The sorting out of facts is essentially an intellectual activity. The Intellect, however, is only one faculty of the Soul. When we think about something, we are apt also to have feelings about it, and our impulse to express our feelings is still stronger than our impulse to express our thoughts. Feelings about History, as well as thoughts about it, have inspired historical works, and similar feelings, evoked by similar facts, have also been expressed in imaginative works in the divers genres of literature. There is, for example, a lyrical genre, an epic genre, a narrative genre, and a dramatic genre; and the feeling for the poetry in the facts of History has availed itself of all of these.

The lyrical genre—to begin with that—is one that has many facets. It may present itself in rejoicings at a dawn, in exultations over a liberation, in celebrations of an achievement, in praises of heroism, or in elegies over the sorrows of Human Life.

The joy of dawn is the emotional charge in some of the most famous scenes in Western history—the Latin Christian warriors' shout of 'Deus le volt' in response to Pope Urban II's preaching of the First Crusade, the ministry of Saint Francis of Assisi seen through Giotto's and through Saint Thomas of Celano's eyes, the landfalls of the *Pinta*¹ and the *Mayflower*, the signing of the Declaration of Independence, the taking of the Tennis Court Oath—and the poetry in some, at least, of these historic events has been uttered in lines that speak more eloquently than volumes. The poetry in the American Revolutionary War has been distilled by Emerson into one quatrain:

By the rude bridge that arched the flood,
Their flag to April's breeze unfurled,
Here once the embattled farmers stood
And fired the shot heard round the World.²

¹ Though the first member of Columbus's first expedition to sight land was a sailor on board the *Pinta*, this vessel's name had not won equal renown with the *Santa Maria*, which was the Admiral's flagship.

² Emerson: *Concord Hymn*, stanza 1.

The poetry in the French Revolution has been distilled by Wordsworth into two lines:

Bliss was it in that dawn to be alive,
But to be young was very Heaven.¹

It is no wonder that, in these rejoicings at a dawn, the historians should have had to let the poets be their spokesmen; for the joy awakened by the dawn of a new era of History is the Soul's response to an epiphany that is something more than a merely temporal event. The dawns that awaken such joy as this are irruptions into Time out of Eternity. What has happened on these historic occasions likewise happens at the birth of every child:

'A woman when she is in travail hath sorrow, because her hour is come; but, as soon as she is delivered of the child, she remembereth no more the anguish, for joy that a man is born into the World.'²

In a mother's joy the Soul hails an incarnation; and, since 'alles Vergängliche ist nur ein Gleichnis',³ the dawns of mundane eras that have this poetry in them are antitypes of cosmic dawns in which a Divine Light breaks into This World. A radiance which shines in upon us through Botticelli's picture, in the National Gallery in London, of the birth in the stable at Bethlehem is likewise manifest in the enlightenment under the Bodhi Tree, in the descent of the Dove at the baptism in Jordan, in the transfiguration on the mountain, in the vision on the road to Damascus, and in the imprinting of the stigmata in the wilderness; and, as Milton's voice strikes up in a Franciscan ode on the morning of Christ's nativity, Gibbon's voice dies away.

The thrill of liberation is the emotional charge in the historic events conveyed in the words Marathon, Salamis, Befreiungskrieg, Risorgimento, Renaissance; and these mundane historical events that have this poetry in them are antitypes of the Resurrection on Easter Morning. The bliss of achievement is the emotional charge in the recollection of Athens and Florence; in the spectacle of the Altar and Temple of Heaven, the frieze from the Parthenon, the church of the Ayía Sophía, and the Green Mosque;⁴ and in the reading of *La Divina Commedia*; and these human achievements that have this poetry in them are antitypes of the ministries of Christ and the Buddha and the missions of all the bodhisattvas, prophets, and saints, down to a John Wesley and a Mahatma Gandhi, who have come and gone already and will be followed, through the ages, by later members of their goodly fellowship.⁵ The glory of heroism is the emotional charge in the memories of the Three Hundred at Thermopylae, the Six Hundred at Balaclava, the Four Thousand at Waterloo,⁶ and the Fifteen Thousand at Gettysburg; and

¹ Wordsworth: *The Prelude*, Book XI, ll. 108-9, incorporating *The French Revolution as it appeared to Enthusiasts at its Commencement*.

² John xvi. 21.

³ Goethe: *Faust*, ll. 12104-5.

⁴ A writer who had also seen the Dome of the Rock and the Tāj Mahal would, no doubt, mention these, too, at this point. By A.D. 1952 the present writer had already thrice visited Brusa, but he had not yet set foot in either Jerusalem or Agra.

⁵ *Te Deum*, verse 8.

⁶ If this was in truth the strength of the battalions of the French Imperial Guard that took part in the final assault and the subsequent last stand at Waterloo (see Rose, J. H.: *The Life of Napoleon I* (London 1904, Bell, 2 vols.), vol. ii, pp. 506-8).

these martial heroes are subjects for the poetry of a Tennyson or a Simonides in so far as they are antitypes of the Noble Army of Martyrs.¹

'They were stoned, they were sawn asunder, were tempted, were slain with the sword; they wandered about in sheepskins and goatskins, being destitute, afflicted, tormented (of whom the World was not worthy); they wandered in deserts and in mountains, and in dens and caves of the Earth.'²

As for the *lacrimae rerum*,³ these are as innumerable as the drops of water in the sea, since sorrow is the web of Man's mortal life. This is the emotional charge in Hesiod's elegy on Homer's heroes⁴ and in Ch'ü Yüan's and Angilbert's elegies on the victims of fratricidal warfare.

The warriors are all dead: they lie on the moor-field.
They issued but shall not enter: they went but shall not return.
The plains are flat and wide: the way home is long.
Their swords lie beside them: their black bows, in their hand.
Though their limbs were torn, their hearts could not be repressed. . . .
Steadfast to the end, they could not be daunted.
Their bodies were stricken, but their souls have taken Immortality—
Captains among the ghosts, heroes among the dead.⁵

The same voice that speaks these lines written in a Sinic Time of Troubles also makes itself heard in lines written during a post-Carolingian interregnum.

Albent campi vestimentis mortuorum lineis
Velut solent in autumnno albescere avibus. . . .
Maledicta dies illa, nec in anni circulo
Numeretur, sed radatur ab omni memoriâ,
Iubar Solis illi desit, Aurora crepusculo,
Noxque illa, nox amara, noxque dura nimium,
In quâ fortes ceciderunt, proelio doctissimi,
Pater, mater, soror, frater, quos amici fleverant.⁶

The chord of feeling that is touched by the pathos of the warriors' death in battle also sounds in response to the tragedy of the failure of a life-work. The tragedy of the extinction of a forlorn hope that had glimmered like a will-o'-the-wisp over Julian the Apostate's brief career has been conveyed by Libanius in two hexameters, of which the second is a Homeric reminiscence:

Ἰουλιανὸς μετὰ Τίγριν ἀγάρροον ἐνθάδε κεῖται,
ἀμφοτέρων, βασιλεὺς τ' ἀγαθὸς κρατερός τ' αἰχμητής.⁷

The Apostate was, in spite of himself, an imitator of Christ; for such dedicated lives and tragic deaths as his are antitypes of Christ's passion,

² Hebrews, xi. 37-38.

³ Virgil: *Aeneid*, Book I, l. 462.

⁴ Hesiod: *Works and Days*, ll. 156-73, quoted in VIII. viii. 75.

⁵ Ch'ü Yüan (*vivebat* 332-295 B.C.), translated by Arthur Waley in *A Hundred and Seventy Chinese Poems* (London 1920, Constable), pp. 23-24.

⁶ Angilbert's elegy on the Battle of Fontenoy (*commisum* A.D. 841), in *The Oxford Book of Medieval Latin Verse*, chosen by Stephen Gaselee (Oxford 1928, Clarendon Press), pp. 45-46.

⁷ Attributed to Libanius in *Anthologia Palatina*, Book VII, No. 147, but quoted without attribution by Zosimus in his *Historiae*, Book III, chap. 34. The second of the two lines is taken from the *Iliad*, Book III, l. 179, in which Helen is describing Agamemnon.

and the poetry in those elegies moves our hearts because our ears are catching the tones of the liturgy for Good Friday and our inward eye is beholding the Agony in the Garden—perhaps in the visual renderings of it that are presented in the pictures by Bellini and Mantegna which, in June 1951, were hanging side by side in the National Gallery in London.

The epic genre expresses the sense of romance that is evoked by conquests and defeats, by treks and voyages, and by the musical flow of the all-embracing ocean of History.

The dazzling personal triumphs of a Cyrus, Alexander, Caesar, Chingis, Timur, Cortés, Nādir Shāh, Clive, Wellesley, or Napoleon and corporate triumphs of the Macedonian, Arab, Mongol, Castilian, or British *conquistadores* have their dark reverse side in the agonies of their victims; and the sympathies of Mankind are revealed in the poets' choice of epic themes. Among the poets there is a consensus—which is impressive because it is tacit and manifestly undesigned—in feeling that the poignant woes of the conquered offer to the imagination a more promising subject than the conquerors' prosaic successes; and the victims are thus apt to win a posthumous revenge for their historical defeats on physical battlefields by rising from the dead to be crowned with a literary immortality.¹

Even a violent death by Brutus's hand at the high tide of his career could not recapture for Pompey's conqueror the pathos with which Pompey's death had been invested by his foregoing defeat—as witness Plutarch's inability to move us by his account of Caesar's end as we are moved by the corresponding passage in *The Life of Pompeius Magnus*.² The sordid liquidation of a war-lord who has outlived his prime has been transfigured by the victim's suffering into a symbol of a sorrow that is at the heart of Human Life. On the same poetic plane, Yazdagird has had the last word against S'ad b. abī Waqqās, Roderick against Tāriq, Jalāl-ad-Dīn Mankubirnī against Chingis, and Constantine Dhrágasis against Mehmed Fātih. Even Musta'sim the unready and Atahualpa the usurper and fratricide are redeemed by the wanton cruelty with which their conquerors put them to death; and, if any laurels had sprung from Hūlāgū's sack of Baghdad or from Pizarro's rape of the Empire of the Four Quarters, these would not have adorned the murderer's brow. As for the Aztecs and the Assyrians, nothing became these blood-thirsty militarists so well as the last stands in which they gloriously displayed the courage of their abominable convictions. The no less abominable spirit and conduct of Homer's Achilles would be likewise beyond bearing if the listener were not all the time conscious that this egotist-savage knew full well that he was doomed to die in the flower of his youth. The true hero of the Iliad is, of course, not a conquering Achilles but a conquered Hector; and, though the triumphant war-lord Agamemnon's return home had the power to inspire a consummate work of art, Aeschylus's play had a superhuman theme in the awful irony of Divine Retribution. Even the pitiful crumbling of the Achaean

¹ This compensation for historical fact in 'heroic' tradition has been noticed in V. v. 607-14.

² Chaps. 77-80.

Power on the morrow of the Achaeans' ruthless sack of Troy evoked no poetry to match Euripides' *Troades* or the second book of Virgil's *Aeneid* or Abū'l-Baqā of Ronda's elegy on the *excidium* of Andalusia.

As a fond lover weeps at parting from his beloved, bitterly weeps the
Glorious Religion of Abraham
For desolate countries forsaken by Islam and peopled only by Infidelity.
Their mosques have become churches: there is nothing in them but
bells and crosses,
So that the mihrābs¹ weep, though lifeless, and the minbars² mourn,
though wooden. . . .
Oh, who will come to the help of a people once mighty but now abased,
once flourishing but now oppressed by Unbelievers?
Yesterday they were kings in their dwelling-places, and to-day they are
slaves in the land of the Infidel.
And what if thou couldst see them stricken with consternation, with
none to guide them, wearing the garments of ignominy!
Couldst thou but see them weeping when they are sold, the sight would
dismay thee and throw thee into a frenzy of grief.
Ah, betwixt many a mother and child comes such a sundering as when
souls are parted from bodies!
And many a young girl, beauteous as the new-risen Sun, blushing like
rubies and coral,
The barbarian drags to shame by force, her eyes weeping, her mind dis-
traught.
A sight like this melts the heart with anguish, if in the heart there be a
Muslim's feeling and faith.³

The sorrows of the conquered must be the theme of the epic of Andalusia, since the triumphs of military conquerors—Achaean or Castilian—are not the stuff out of which poetry is made.

Only the actions of the just
Smell sweet and blossom in their dust.⁴

The only conquerors who court no literary nemesis are the victorious missionaries of higher religions whose epic deeds have been hymned in the Acts of Buddhist, Christian, and Muslim Apostles.

The poetry in treks and voyages likewise flows in the epic vein. It wells up in the *Völkerwanderungen* of the barbarians; in the 'Crusades' of the ex-barbarian Medieval Western Christian Latins and Primitive Muslim Arabs; in the Winning of the West by Sinic Pioneers in the second century B.C. and by North American pioneers in the nineteenth century of the Christian Era; in the Winning of the East by John of Piano Carpini, William of Rubruck, Niccolò, Maffeo, and Marco Polo and the other intrepid thirteenth-century Latin travellers who made the iron journey to Qāraqorum and Xanadu across the breadth of the Great Eurasian Steppe; in the prowess of Cossack watermen who pushed their way over tundra and through forest from the Urals to the Pacific

⁴ Shirley: *Death the Leveller*, the closing lines.

within the brief Time-span of some fifty years;¹ in Colaeus's voyage to Tarshish between the Pillars of Hercules² and Columbus's passage of the Atlantic from Tarshish to the Antilles; in the fifteenth-century exploration of the Indian Ocean by Far Eastern mariners³ who all but anticipated, from east to west, Vasco da Gama's subsequent feat of circumnavigating Africa from west to east; in the conquest of the Pacific by eastward-faring canoes and (perhaps) by westward-faring balsarafts;⁴ in the conquest of the North Pole, South Pole, Air, Stratosphere, and Mount Everest by Western adventurers within the lifetime of the writer and reader of this Study; and in the pilgrimages of all pilgrims to Holy Places.

As for the grand epic whose theme is History herself, this stands in two rival versions which cannot be reconciled, though both of them can be deduced from Watts' picture of Chaos or from Sophocles' paean⁵ on human achievement:

Wonders are many, but none there be
So strange, so fell, as the Child of Man.⁶

H. G. Wells in *The Outline of History* has written an epic poem on the theme 'Man Makes Himself' which is explicit in the title of a subsequent book from the pen of an eminent Western archaeologist of the next generation.⁷ This bleak assertion is a post-Christian Western Man's defiant answer to the Psalmist's joyful assurance that 'the Lord He is God' and that 'we are His People and the sheep of His pasture' because 'it is He that hath made us and not we ourselves';⁸ and that verse enunciates the theme of History as a series of encounters between Man and his Creator in which a Paradise that has been lost through a Fall is regained through a Redemption, and in which this deliverance⁹ of God's creature is achieved at the cost of a passion that Christ has suffered 'for the means of grace and for the hope of glory'.

The opening lines of this *Divina Commedia* are to be found in another psalm:

I will give thanks unto Thee, for I am fearfully and wonderfully made;
marvellous are Thy works, and that my soul knoweth right well.

My bones are not hid from Thee, though I be made secretly and fashioned beneath the Earth.

Thine eyes did see my substance, yet being imperfect, and in Thy book were all my members written,

Which day by day were fashioned when as yet there was none of them!

How dear are Thy counsels unto me, O God; O how great is the sum of them!

If I tell them, they are more in number than the sand; when I wake up, I am present with Thee.¹⁰

¹⁰ Psalm cxxxix. 14-18 (13-18 in *The Book of Common Prayer*).

When we pass on to the story-teller's genre of literary art, we find the novelist vying with the diarist, the biographer, and the letter-writer to determine whether 'Fiction'¹ or 'Fact' is the more propitious medium for bringing out the poetry in the private affairs of ordinary people. In this competition between two rival forms of the art of distilling poetry out of a story, a Pepys, Saint Simon, Boswell, Manucci,² Cicero, and Horace Walpole are arrayed against an Herodotus,³ the anonymous authors of *The Three Kingdoms*,⁴ and a Modern Western school of historical novelists.⁵

The dramatic genre of literary art has the power of conveying the poetry in the facts of History in an ascending order of degrees. It may content itself with a bare rehearsal of the drama that is inherent *ipso facto* in any reversal of roles (*peripeteia*),⁶ or it may present the drama as an act of Poetic Justice, or it may interpret justice as an inexorable operation of the laws of Destiny or grinding of the mills of God.

Classic examples of the reversal of roles in the histories of civilizations are the successive overthrows of the Achaemenian Empire by Macedon and of Macedon by Rome,⁷ the triumph of Christianity over Paganism in the Roman Empire, the change in the fortunes of the Southern States of a North American Union through the outcome and aftermath of an American Civil War, and 'the Chain of Destruction', traced in a previous Part of this Study,⁸ in which one ephemeral military technique after another had been dramatically discomfited by a successor which had then suffered the same fate in its turn. On the plane of personal encounters, as contrasted with institutional relations, we may cite one example from the realm of 'Fact' and another from the realm of 'Fiction'.

The sheer drama of *peripeteia* is Polybius's theme in his account of the feelings experienced by the Seleucid King Antiochus III on a night in the year 214-213 B.C. in which his dissident cousin Achaeus, whom he had been besieging in the citadel of Sardis, was suddenly delivered into his hands.

'Since early in the night, the King had been in such a fever of anxious

¹ In so-called 'works of fiction', the element of fiction never amounts to more than a small percentage of the whole matter, and this authentically fictitious ingredient is capable of conveying philosophic truth that is less easy to convey in citations of so-called 'matters of fact' (see I. i. 448-50 and 452-3).

² Manucci, Niccolao: *Storia di Mogor, or Mogul India, 1652-1708*, translated by William Irvine (London 1906-8, John Murray, 4 vols.).

³ e.g., in his tales of Mycerinus (Book II, chaps. 129-33), Rhampsinitus (Book II, chap. 121), Gyges (Book I, chaps. 8-13), Croesus (Book I, chaps. 28-56 and 85-91), Cyrus (Book I, chaps. 107-30), Polycrates (Book III, chaps. 39-43 and 120-5), Dêmocêdês (Book III, chaps. 129-38), and Scylês (Book IV, chaps. 78-80).

⁴ *San Kuo Chih Yen I*, a romantic legend of the Han Empire's three turbulent local successor-states, which developed through the ages till it attained its definitive form in the time of the Ming Dynasty (English translation by Brewitt-Taylor, C. H. (Shanghai 1925, Kelly & Walsh)).

⁵ See the citations in the present writer's 'Acknowledgements and Thanks' on p. 225, below.

⁶ The problem of *peripeteia* has been discussed, apropos of the nemesis of Creativity, in IV. iv. 245-60.

⁷ See Polybius: *Oecumenical History*, Book XXIX, chap. 21, in which the historian of Macedon's overthrow by Rome comments on a passage, commenting on Macedon's triumph over Persia, which he quotes from the work of his predecessor Demetrius of Phalêrum.

⁸ In IV. iv. 431-65.

expectancy, while he was waiting to see how the plot [to kidnap Achaeus] would work out, [that he had been unable to sleep; so] he had dismissed his suite and had sat up in his tent on the alert, with no one in attendance save for two or three aides-de-camp. And now, when Cambylus and his party entered and deposited Achaeus, [captive and] bound, on the floor, the amazingness of this spectacle gave Antiochus such a shock that he was smitten with aphasia. It was a long time before he could utter a word, and, when his feelings did at last find vent, their first manifestation was a surge of sympathy which made him burst into tears.

'If we are to try to interpret this psychological reaction of Antiochus's, my own diagnosis would be that he was overwhelmed by a conviction of Man's impotence to guard against, or even reckon with, the deadly strokes of Fortune. Here lay Achaeus, nephew of Laodicê [II] the wife of Seleucus [II], husband of Laodicê the daughter of King Mithradates [III] of Pontic Cappadocia], and ruler *de facto* till yesterday of all [the dominions of the Seleucid Dynasty] north-west of Taurus. The citadel of Sardis, in which he had established himself, was deemed to be the strongest fortress in the World by the common consent of his own troops and his adversaries. And now here he was, lying bound on the floor, absolutely in the power of his enemies, before the news of this extraordinary event had had time to reach a soul beyond the immediate participants.'¹

This account of a matter of historical fact which occurred in the Hellenic World in the third century B.C. has an unmistakable fictional companion piece in the following passage near the close of a post-Modern Western novel which, as its author tells us in his preface, was finished by him in July 1908. The *mise-en-scène* here is not a tent but a bedroom, and the prone figure is not a prisoner, alive tonight, who will be put to death tomorrow, but a corpse from which the life has already departed. The figure standing silent and unnerved is, in this tableau, not a man's but a woman's, and she is not the prone figure's rival for a crown; she is his deserted wife who 'had not seen him for thirty-six years'. But the shock is no less great, and its elemental cause is the same overwhelming sense of Man's defencelessness against Fate.

'That was no conventional, expected shock that she had received. It was a genuine unforeseen shock, the most violent that she had ever had. In her mind she had not pictured Gerald as a very old man. She knew that he was old; she had said to herself that he must be very old, well over seventy. But she had not pictured him. This face on the bed was painfully, pitifully old. . . . The body, whose outlines were clear under the sheet, was very small, thin, shrunk, pitiable as the face. And on the face was a general expression of final fatigue, of tragic and acute exhaustion; such as made Sophia pleased that the fatigue and exhaustion had been assuaged in rest, while all the time she kept thinking to herself horribly: "Oh! how tired he must have been."'!

'Sophia then experienced a pure and primitive emotion, uncoloured by any moral or religious quality. She was not sorry that Gerald had wasted his life, nor that he was a shame to his years and to her. The manner of his life was of no importance. What affected her was that he had once been young, and that he had grown old, and was now dead. That was all. Youth and vigour had come to that. Youth and vigour always came to that. Everything came to that. He had ill-treated her; he had abandoned her;

¹ Polybius: *Oecumenical History*, Book VIII, chap. 20.

he had been a devious rascal; but how trivial were such accusations against him! The whole of her huge and bitter grievance against him fell to pieces and crumbled. She saw him young, and proud, and strong, as for instance when he had kissed her lying on the bed in that London hotel—she forgot the name—in 1866; and now he was old, and worn, and horrible, and dead. It was the riddle of Life that was puzzling and killing her.¹

In this riddle of Life the change from Life to Death is, of course, the supreme *peripeteia*. 'All men are born with halters round their necks; but it is only when caught in the swift, sudden turn of death that mortals realise the silent, subtle, ever-present perils of life.'² This total change that deprives Life of Life itself must be of the same absolute magnitude for every creature.

The poor beetle that we tread upon
In corporal sufferance finds a pang as great
As when a giant dies;³

and Death the Leveller brings Gerald Scales' tragedy to a parity with Achaëus's.

Sceptre and Crown
Must tumble down
And in the dust be equal made
With the poor crookèd scythe and spade.⁴

Yet the direness of the reversal of Fortune is, if not more evident, at least more ironic, in the deaths of mortals who, in this transitory life, have been invested with an ephemeral show of power and wealth.

Mortality, behold and fear
What a change of flesh is here!
Think how many royal bones
Sleep within these heaps of stones.
Here they lie, had realms and lands,
Who now want strength to stir their hands,
Where from their pulpits seal'd with dust
They preach 'In greatness is no trust.'
Here's an acre sown indeed
With the richest, royallest seed
That the Earth did e'er suck in
Since the first man died for sin.
Here the bones of birth have cried
'Though gods they were, as men they died!'
Here are sands, ignoble things,
Dropt from the ruin'd sides of kings:
Here's a world of pomp and state
Buried in dust, once dead by Fate.⁵

The drama of *peripeteia*, which has been given these classic expressions by great artists in the twin realms of 'Fact' and 'Fiction', and which is

the theme of Edmund Spenser's fluttering stanzas on Mutability,¹ reaches its acme in the realm of 'Myth', where the Truth can be uttered whole and entire because 'the ineffable is here accomplished'.² In the encounters between David and Goliath, Solon and Croesus, Jesus and Pilate, the mystery is progressively revealed to the initiate's understanding.

The Poetic Justice whose judgements this drama executes is most familiar in the realm of brute force.

'When a strong man armed keepeth his palace, his goods are in peace; but, when a stronger than he shall come upon him and overcome him, he taketh from him all his armour wherein he trusted, and divideth his spoils.'³

'All they that take the sword shall perish with the sword';⁴ and the justice that ever lies in wait for 'the slayer' who 'shall himself be slain'⁵ has overtaken the sons of Cratos and Bia⁶ in a long procession, headed by Hesiod's Race of Bronze,⁷ in which the Aztecs tread on the heels of the Assyrians, while the rear is brought up by Prussians marching to their own destruction into lands that they have invaded in cold blood.

Οὐδ' ὅστις πάρουθεν ἦν μέγας,
παμμάχῳ θράσει βρύων,
οὐδέ λέξεται πρὶν ὧν
ὅς δ' ἔπειτ' ἔφν, τρια-
κτῆρος οἴχεται τυχών.⁸

Yet the doom of liquidation is not the heaviest sentence that can be passed by Justice on an unconscionable militarist. She may stay the hand of the external 'enemy and avenger'⁹ in order to give a triumphant victor time and occasion to emulate a demented Cleomenes' fearful vengeance upon himself.

'When he had gained possession of the edged tool, Cleomenes began to mutilate himself from below the knees upwards by slashing his flesh into strips. He began below the knees, and went on from there to his thighs and from his thighs to his hips and his flanks until he reached his stomach and died in the act of cutting this to ribbons.'¹⁰

Such long-drawn-out acts of *hara-kiri* have been the self-inflicted dooms of militarists collectively as well as individually.

Ergo inter sese paribus concurrere telis
Romanas acies iterum videre Philippi.¹¹

The century of Roman domestic revolutions and civil wars (*saeviebant* 133-31 B.C.) was the nemesis of a half-century of wars of conquest in which Rome had made herself the unchallengeable mistress of the Hel-

lenic World.¹ Rome, and Rome only, was left to bring Rome to justice; and, within the hundred years opening with the year of Tiberius Gracchus's tribunate, Rome duly measured to herself again with the same measure that she had meted withal—'good measure, pressed down, and shaken together and running over'.² The dragon's-tooth seed of plantation slavery sown in areas devastated by the Hannibalic War produced an unintended crop of 'mean freemen'; and no less terrible examples of a self-inflicted nemesis were to be found in the post-Christian chapters of a Modern Western Society's history. A crop of 'mean Whites' had been the unintended harvest wherever the ubiquitous pioneers of a West European Civilization had sown the seed of Negro slavery, while the trade-union spirit and the civil service spirit had been the fruits of the enslavement of souls to machines in a Modern Western Industrial Revolution.³

The inexorability of the mills of God in grinding out the sentences passed by Justice was borne in upon the soul of Scipio Aemilianus in the last hour of Rome's once formidable rival and adversary, Carthage, according to the first-hand testimony of the Roman commander's Megalopolitan friend and companion, Polybius.

'When Scipio saw this great and ancient city meeting her end for ever in utter annihilation, he is said to have burst into tears and not to have concealed the fact that he was weeping for the enemy. For a long time he remained wrapped in his own thoughts; he realised that cities and nations and empires were destined, by God's providence, to pass away; he remembered that this had been the fate of Ilion, a city prosperous in its day; the fate of the Assyrian and Median and Persian empires which, each in turn, had once been the greatest in the World; and the fate of the Macedonian Empire, the most recent and most brilliant of them all. Then, whether deliberately or unconsciously, he recited aloud the lines:

A day of doom shall dawn, and on that day
Shall Holy Ilion's city pass away,
And Priam, that great spearman, and the host
Of Priam's people in their proud array.⁴

Polybius, whose pupil Scipio had been, asked him in so many words what he intended by the quotation, and Scipio is said to have thrown aside all reserve and to have uttered the name of his own country, on whose behalf he was filled with foreboding by his vision of the destinies of Man. This has been recorded at first hand by Polybius himself.⁵

This spiritual experience of Scipio's convicts him of having been under the dominion of a doctrine of doom which was of the essence of the Hellenic *Weltanschauung* and which worked no less potently in Hellenic souls in which it was unavowed than in those in which it was explicit. This doctrine is enunciated starkly in Herodotus's stock formula

¹ See Polybius: *Oecumenical History*, Book I, chap. 1, quoted on p. 64, above.

² Luke vi. 38. Cp. Matt. vii. 2; Mark iv. 24.

³ See XII. ix. 561-604 (especially 565-6, 572-4, 587). ⁴ *Iliad*, Book IV. ll. 164-5.

⁵ Polybius: *Oecumenical History*, Book XXXVIII, chap. 22. The original text has been lost, but the sense of it has been preserved in the paraphrase, here quoted, by a latter-day Hellenic historian, Appian of Alexandria (*vivebat circa* A.D. 90-160), who was writing in the deceptive sunlight of an Antonine 'Indian Summer'. The passage will be found in Appian's *Roman Studies*: 'The Book of Africa', chap. 132.

'Evil had to befall so-and-so, and therefore' there followed the action, whatever it might be, that brought this doom to pass.¹ A classical situation in which this doctrine seems to be true to life is the apparently inexorable approach of a civil war which everyone can foresee yet no one can avert because no one can—or will—exorcise the besetting sin which is the root of the evil. In the bosom of a post-Scipionic Roman Commonwealth the awful civil war of 90–80 B.C. duly broke out and continued to rage until it had burnt itself to ashes, though its advent had been foreseen and dreaded in advance for at least forty-three years (133–90 B.C.). In the bosom of a North American Union the no less awful civil war of A.D. 1861–5 arose and ran its dreadful course notwithstanding the efforts to avert it that had been made by statesmen on both sides for at least forty-one years running from the negotiation of 'the Missouri Compromise' in A.D. 1820. The drama of inexorability which these tragic passages of History exemplify can be conveyed in poetry better than in prose—as witness two masterpieces of post-Modern Western literature: Stephen Vincent Benét's poem *John Brown's Body* and Thomas Hardy's 'epic drama' *The Dynasts*. There is a veritably Hellenic order in the economy of the English poet's two-storied stage, on which the actions of human beings on Earth who seem to themselves to be freely exercising their wills appear at a supra-mundane level to be determined by the fiat of principalities and powers whose activities are invisible to their human puppets.

At this level the poetry in the facts of History raises the question of the meaning behind the facts with an insistence that it is impossible to ignore. If Necessity is queen of the last act of the play, can Freedom have ever reigned at any stage? If sinners are powerless to elude their punishment, was it ever in their power to avoid committing the sin for which this punishment is the nemesis? And, if the sin has been as inevitable as the punishment is inexorable, how can the doom which the pitiless mills grind out be identified with Justice? If we are to salvage our theodicy,

'we require a theory of human motives which will allow of our conceiving them, simultaneously, both as supernatural causes coming from without and also as integral parts in the working of the agent's mind.'²

When these words were written by a prescient-minded Western classical scholar in or before A.D. 1907, he declared what was the truth at the time when he added that 'Modern Psychology is, of course, not equal to the task of this reconciliation'. Within the forty-six years, however, that had elapsed between the publication of Francis Cornford's book and the time of writing of these lines, a post-Modern school of Western psychologists had rehabilitated as a scientific hypothesis the Hellenic religious belief that Cornford had diagnosed and expounded. In the 'autonomous complex' erupting from the abyss of a Subconscious Psyche to challenge the sovereignty of a Conscious Will that must

¹ See, for example, Herodotus, Book I, chap. 8; Book IV, chap. 79; Book V, chap. 33 [in the negative]; Book V, chap. 928; Book VI, chap. 64; Book VI, chap. 135; Book VII, chap. 11; Book VII, chaps. 17–18; Book VIII, chap. 35; Book IX, chap. 109.

² Cornford, F. M.: *Thucydides Mythistoricus* (London 1907, Edward Arnold), pp. 154–5.

either subdue the intruder or suffer the consequences of becoming its slave, we are manifestly presented with a 'scientific' name for the *kêr* or *daimon* that assails the hero of an Attic tragedy.¹ In both these expressions of the identical idea of spiritual 'possession', the linguistic resources at a Time-bound mind's disposal are misleadingly inadequate; for, if the full-blooded language of Hellenic mythology falls wide of the truth in portraying these dread principalities and powers as conscious and wilful personalities, the anaemic language of Western science falls equally wide in classifying them as inanimate abstractions. Yet, through either glass, we see the same truth darkly.

This problem of the relation between Law and Freedom, which is presented by the phenomenon of *Peripeteia*, must not, however, detain us at this point from completing the course of our Study. We have wrestled with it at least twice already at earlier points,² and we should gain nothing now by stepping aside to try a fall with it again. Our present, and concluding, subject is the inspirations of historians.

¹ 'Internally, temptation takes the form of a violent passion, uncontrollable if its victim is unguarded and secure. The conquerors of Troy are beset by Erôs, the spirit of rapine; but this passion is not conceived [of] as a natural state of mind determined by a previous state—the effect of a normal cause; it is a spirit (*δαίμων*) which haunts, swoops down, and takes possession of the Soul when Reason slumbers and keeps no watch. Erôs is constantly spoken of by the Greeks as a disease (*νόσος*); but that word had not the associations merely of a wasting and painful bodily corruption. Diseases were caused by invading spirits, those malignant *kêres* of whom Age and Death are the chief, and who seize as much upon the Soul as upon the Body. . . . This to the Greeks was a very familiar idea.'—Cornford, *op. cit.*, pp. 157–8.

² e.g. in IV. iv. 245–61 and in XI. ix. 167–405, *passim*.

E. THE QUEST FOR A MEANING BEHIND THE FACTS OF HISTORY

The meaning behind the facts of History towards which the poetry in the facts is leading us is a revelation of God and a hope of communion with Him; but in this quest for a Beatific Vision that is visible to a Communion of Saints we are ever in danger of being diverted from our search for God to a glorification of Man; and this sin of associating the creature with the Creator¹ precipitates the man-worshipper into a continuing fall from idolatry through disillusionment to an eventual depreciation of Man which is almost as excessive as the adulation to which it is the inevitable sequel.

From morn
To noon he fell, from noon to dewy eve.²

An idolization of Man by Man himself, which is patently ridiculous when the idol is some individual mannikin, may be more specious when the blasphemous worship is paid to some collective Leviathan. Yet the state-worship that a post-Christian Western Society commended as 'patriotism' and the church-worship that it denigrated as 'fanaticism' both turn as bitter on the palate as the hero-worship of an Alexander, Hitler, Caesar, or Napoleon. In whatever form this anthropolatry may be practised, it stultifies itself by passing over into irony. 'Plus ça change, plus c'est la même chose.'³ 'Any man of forty who is endowed with moderate intelligence has seen—in the light of the uniformity of Nature—the entire Past and Future.'⁴ And what a spectacle is presented by 'the best of all possible worlds' with which Voltaire makes play, at Leibnitz' expense, in *Candide*. 'Recordare, mi fili, quam parvâ sapientiâ mundus regitur.' An aphorism attributed to a seventeenth-century Western statesman is matched by an eighteenth-century Western historian's sardonic description of History as being 'little more than the register of the crimes, follies, and misfortunes of Mankind'.⁵ 'All is vanity' is the refrain of Ecclesiastes; and, from this disillusioning anthro-

¹ The judgement on 'association' (*shirk*) in the Qur'an has been noticed in I. i. 9, n. 3.

² Milton: *Paradise Lost*, Book I, ll. 742-3.

³ Karr, Alphonse: *Les Guêpes*, January 1849.

⁴ Aurelius, Marcus: *Meditations*, Book IX, chap. 2, quoted in V. vi. 137. Marcus's melancholy view of Human Life was brought home to the writer by two repetitive experiences—one consummated when he was fifty-one and the other when he was fifty-seven. One day in May 1940, as he was approaching the corner of the Cornmarket and George Street in Oxford, his eye caught a poster in a newspaper-vendor's hand announcing: 'Liège falls: Forts held impregnable smashed by German guns', and, for an instant, he was at a loss to know whether he was living in A.D. 1940 or in A.D. 1914, because, at that same corner in August 1914, he had been given the same shock by a poster displaying the same words. His second experience of the kind occurred on a day in April 1946, when, as the official train carrying the British Delegation to the Peace Conference of Paris halted at a point between Calais Harbour and Calais Town, it occurred to him that this was the point where the Delegation had been given lunch when they had been travelling this way on this train on a day in December, 1918. Looking out of the railway-carriage window to identify the building, he found that this time it had been raised to the ground.

⁵ Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, chap. iii, echoing Bayle, P.: *Dictionnaire*, 3rd. ed., iii. 1899b, s.v. Manichéens.

po-centric angle of vision, Life presents the mirage of a wilderness, not only for Mankind but for the gods.

'The Sun hides not Virginia's Dismal Swamp, nor Rome's accursed Campagna, nor wide Sahara, nor all the millions of miles of deserts and of griefs beneath the Moon. The Sun hides not the Ocean, which is the dark side of this Earth and which is two-thirds of this Earth. So, therefore, that mortal man who hath more of joy than sorrow in him, that mortal man cannot be true—not true, or undeveloped. . . . The Gods themselves are not for ever glad. The ineffaceable sad birth-mark in the brow of Man is but the stamp of sorrow in the signers.'¹

Happily Man can find no rest in this spiritual *cul-de-sac*, and his disillusionment with his grotesquely deified Self drives him back into the narrow way which leadeth unto Life² across a bridge built for him by the saving irony of the Gospels.

'Thou fool, this night thy soul shall be required of thee.'³

'For whosoever will save his life shall lose it, and whosoever will lose his life for My sake shall find it. For what is a man profited if he shall gain the whole World and lose his own soul? Or what shall a man give in exchange for his soul?'⁴

When 'Dominus illuminatio mea' is taken in lieu of 'Man is the measure of all things'⁵ as Man's key to the riddle of Human Life, the vanity of Man is transfigured in this divine light.

'Lord, what is Man that Thou takest knowledge of him, or the Son of Man that Thou makest account of him? Man is like to vanity; his days are as a shadow that passeth by.'⁶

This divine concern with Man's vanity, which for the Psalmist is an enigma, is for Job one of the aggravating circumstances of Man's intolerable plight.

'Let me alone, for my days are vanity. What is Man that Thou shouldest magnify him and that Thou shouldest set Thine heart upon him? And that Thou shouldest visit him every morning and try him every moment? How long wilt Thou not depart from me, nor let me alone till I swallow down my spittle?'⁷

But there is another psalm in which Job's petulant question finds its answer.

'What is Man that Thou are mindful of him? And the Son of Man, that Thou visitest him? For Thou hast made him a little lower than the angels, and hast crowned him with glory and honour. Thou madest him to have dominion over the works of Thy hands; Thou hast put all things under his feet. . . . O Lord our lord, how excellent is Thy name in all the Earth.'⁸

A spectacle in which no meaning can be found, so long as the meaning

of it is sought in the creature's vain endeavours, proves to be meaningful as soon as the meaning of it is sought in the Creator's indwelling purpose. 'Seek, and ye shall find; knock, and it shall be opened unto you'¹ is the message of salvation from the Dweller in the Innermost.

'Les grandeurs et les misères de l'homme sont tellement visibles qu'il faut nécessairement que la véritable religion nous enseigne et qu'il y a quelque grand principe de grandeur en l'homme, et qu'il y a un grand principe de misère. Il faut donc qu'elle nous rende raison de ces étonnantes contrariétés.'²

In Pascal's vision, it is part of the paradox of Human Nature that

'L'homme n'est qu'un roseau, le plus faible de la Nature, mais c'est un roseau pensant';³

and the purpose for which this 'thinking reed' has been created is proclaimed by Jalāl-ad-Dīn Rūmī in the opening lines of the *Mathnawī*.

Hearken to this reed forlorn
Breathing, even since 'twas torn
From its rushy bed, a strain
Of impassioned love and pain. . . .

'Tis the flame of Love that fired me,
'Tis the wine of Love inspired me.
Wouldst thou learn how lovers bleed,
Hearken, hearken to the reed.⁴

While 'the Heavens declare the glory of God, and the Firmament showeth His handiwork',⁵ this singing reed reveals God's purpose. As the Sun, when he 'rejoiceth as a giant to run his course',⁶ is the source from which 'the things that are seen'⁷ derive not only their visibility but their genesis and their growth and their sustenance,⁸ so God is the source from which Man derives his significance as well as his consciousness and his life, and the purpose of God that is the reason for Man's existence is that the creature should re-enter into communion with its Creator.

When Man's quest thus finds its true *qiblah*, Man's spirit rises to the full height of its powers, and at this spiritual altitude the Soul's feeling for the poetry in the facts of History is transfigured into a sense of awe in the presence of an Almighty God ('*azza wa jalla*) who is also God the Merciful and the Compassionate: Allāh ar-Rahmān ar-Rahīm. The lyrical feeling is transfigured into awe at 'the tender mercy of our God whereby the dayspring from on high hath visited us';⁹ the epic feeling into awe at God's execution of His providential designs. 'This is the Lord's doing, and it is marvellous in our eyes';¹⁰ and the psalmist's eager acclamation is involuntarily endorsed by a Laodicean historian when, in writing the last lines of *The History of the Decline and Fall of the Roman Empire*, Gibbon is moved to describe his subject as 'the greatest,

perhaps, and most awful scene in the history of Mankind'. Awe lends wings even to the pedestrian poetry of the story-teller. 'I have been young and am now old, and yet saw I never the righteous forsaken, nor his seed begging their bread.'¹ But the drama in the facts of History is the province of poetry in which Awe comes into its kingdom. 'He hath put down the mighty from their seat and hath exalted the humble and meek'² is a Christian theme that, even in a pagan rendering,³ brings the Soul within a bow-shot of God's awful presence. This presence makes itself felt behind the human figures of the prophets who deliver the burden of Nineveh and the burden of Babylon.⁴

The might of the Gentile, uns mote by the sword,
Hath melted like snow in the glance of the Lord.⁵

And the doom of the militarist is only the most dramatic application of a sentence that has been passed on all the shadowy unsubstantial glories of our blood and state.

Some men with swords may reap the field
And plant fresh laurels where they kill,
But their strong nerves at last must yield:
They tame but one another still.
Early or late
They stoop to Fate,
And must give up their murmuring breath
When they, pale captives, creep to death.⁶

When the feeling for the poetry in the facts of History is thus transmuted into awe at the epiphany of God in History, the historian's inspiration is preparing him for an experience that has been described as 'the Beatific Vision' by souls to whom it has been vouchsafed. In this experience, God is seen face to face, and no longer through a glass darkly;⁷ and this means that the vision carries the Soul beyond the limits of History or of any other avenue of approach towards God through His revelation of His nature in His works. Yet, for every seeker after God, his own God-given glimpse of the marvels of the Created Universe—narrow-verged though his human horizon is bound to be—is a lamp unto his feet and a light unto his path;⁸ and the historian's path ascends from a feeling for the poetry in History through a sense of awe at God's action in History to a participation in Man's fellowship with Man which brings him to the threshold of the saint's communion with God.

In this process of progressive initiation, the first stage in an historian's spiritual pilgrimage is the experience of a communion on the mundane

¹ Psalm xxxvii. 25.

² Luke i. 52.

³ An echo of the verse here quoted from the Gospel according to Saint Luke strikes a Christian ear in the account of the activity of Zeus that is ascribed to Aesop, in colloquy with Chilon, by Diogenes Laertius in *The Lives, Doctrines, and Sayings of the Philosophers of Repute*, Book I, chap. iii, § 2. Between Diogenes' τὰ μὲν ὑψηλὰ ταπεινῶν τὰ δὲ ταπεινὰ ὑψηλῶν and the Lucan ὑψῶσε ταπεινούς there is a verbal correspondence that points to a common literary source.

plane with persons and events from which, in his usual state of consciousness, he is sundered by a great gulf¹ of Time and Space that, in ordinary circumstances, is impassable for all his faculties except his intellect. A tenuous long-distance commerce exclusively on the intellectual plane is an historian's normal relation to the objects of his study; yet there are moments in his mental life—moments as memorable as they are rare—in which temporal and spatial barriers fall and psychic distance is annihilated; and in such moments of inspiration the historian finds himself transformed in a flash from a remote spectator into an immediate participant, as the dry bones take flesh and quicken into life.

The hand of the Lord was upon me and carried me out in the Spirit of the Lord, and set me down in the midst of the valley which was full of bones, and caused me to pass by them round about; and, behold, there were very many in the open valley; and, lo, they were very dry. And He said unto me: 'Son of Man, can these bones live?' And I answered: 'O Lord God, Thou knowest.' Again He said unto me: 'Prophesy upon these bones, and say unto them: "O ye dry bones, hear the word of the Lord. Thus saith the Lord God unto these bones: Behold, I will cause breath to enter into you, and ye shall live; and I will lay sinews upon you and will bring up flesh upon you and cover you with skin and put breath in you, and ye shall live; and ye shall know that I am the Lord."' So I prophesied as I was commanded; and as I prophesied there was a noise, and, behold, a shaking, and the bones came together, bone to his bone. And, when I beheld, lo, the sinews and the flesh came up upon them and the skin covered them above, but there was no breath in them. Then said He unto me: 'Prophesy unto the Wind, prophesy, Son of Man, and say to the Wind: "Thus saith the Lord God: Come from the four winds, O Breath, and breathe upon these slain, that they may live."' So I prophesied as He commanded me, and the breath came into them, and they lived and stood up upon their feet, an exceeding great army.²

'Debout les morts!' The spark that fires an historian's imagination to become a vehicle for this miracle of resurrection may be a quickening encounter with some passage in an historical record or a quickening sight of some historic monument or landscape; and this memorable experience, which is the historian's human reward for his professional labours, may be kindled in the most apparently unpromising tinder.

The present writer, for example, still retained, some forty years after one experience of the kind, an abiding sense of personal participation in the war of 90-80 B.C. between Rome and her Italian allies as a lasting consequence of the instantaneous effect on him of a passage in the table of contents (*periocha*) of the eighty-ninth book of Livy's history upon which he had stumbled one day when, during his reading as an undergraduate for the school of *Literae Humaniores* at Oxford, he was unexpectedly ploughing his way through the surviving précis of the lost books of Livy's work in the faint hope of gleaning some additional scraps of knowledge of the appalling history of the Hellenic World in the last two centuries B.C.

'Mutilus, one of the proscribed [leaders of the Italian Confederacy], succeeded, by muffling his countenance, in making his way undetected to

¹ Luke xvi. 26.

² Ezekiel xxxvii. 1-10.

the back of his wife Bastia's house—only to be refused admittance: she taxed him with having a price on his head. His retort was to plunge his blade into his breast and spatter his wife's door with his blood.¹

As the student read this quickening passage of an arid epitome, he was transported, in a flash, across the gulf of Time and Space from Oxford in A.D. 1911 to Teanum in 80 B.C.,² to find himself in a back yard on a dark night witnessing a personal tragedy that was more bitter than the defeat of any public cause. He saw the Sidicine fugitive, expelled from Nola by craven Samnite comrades-in-arms for fear of Roman retribution if they continued to harbour him,³ stealing up to his own home in his own city in the confident expectation that here, at least and at last, he could count on finding love, loyalty, and shelter; and then, in answer to his low call, a woman's head appears at the window, and one short colloquy informs him that his wife is as heartless as his comrades-in-arms. In an instant, the blade rasps in the scabbard, the body falls with a thud, and the splashing blood irrevocably seals the traitor-wife's infamy.⁴ Already the beat of the avenging Furies' wings can be heard in the air as the twentieth-century eye-witness is caught up again and replaced in a trice in his normal locus in Time and Space.

A stop-watch would, no doubt, have registered that the duration of this transport had been infinitesimally brief; yet, in virtue of the poignancy of the experience, the momentary posthumous spectator's imagination was able, ever after, to recapture the atmosphere of that dire reunion of husband and wife; and this one scene in the tragic drama of a civil war between a Roman Republic and an Italian Confederacy would call up, before his mind's eye, a series of dramatic incidents running back past the climax of the catastrophe to its eve. Through the eyes of a Velleius he could see the Samnite leader Pontius Telesinus lying, on the evening of the 1st November, 82 B.C., at the threshold of the Colline Gate, 'wearing in death the countenance of a victor'⁵ (the Samnite hero was indeed *felix opportunitate mortis*⁶ by comparison with his unhappy surviving Sidicine colleague and comrade Mutilus). Through the ears of Marcus Tullius Cicero, the young recruit, he could hear the parley between the Roman consul Gnaeus Pompeius Strabo and the Marsian

¹ 'Mutilus, unus ex proscriptis, clam capite adoperto ad posticas aedes Bastiae [sic] uxoris cum accessisset, admissus non est quia illum proscriptum diceret; itaque se transfodit et sanguine suo fores uxoris respersit.'—Livy: *Epitome Libri LXXXIX*.

² Gaius Papius Mutilus met his tragic end in the year before that in which Volaterrae capitulated to Sulla (see the passage quoted from Granius Licinianus's history in footnote 3, below), and Volaterrae capitulated (see *ibid.*) in the consulship of [Publius] Servilius [Vatia] and [Appius] Claudius [Pulcher], i.e. in the year 79 B.C.

³ 'Et Volaterrani se Romanis dederunt . . . et proscriptos ex oppido dimiserunt, quos equites a consulibus Claudio et Servilio missi conciderunt. Iam ante [anno superiore] et Samnites qui Nola erant idem fecerant metu obsidionis. Papiusque Mutilus inde fugiens, cum ne ab uxore quidem Bassia noctu Teani reciperetur, quod erat in proscriptionum numero, usus est pugionis auxilio.'—Granius Licinianus, Book XXXVI (*Granius Liciniani quae supersunt*, ed. by Flemisch, M. [Leipzig 1904, Teubner], p. 32).

⁴ Bassia's infamy was the more heinous, considering that, during a soul-testing century of Roman history (133–31 B.C.), when 'a man's foes' were verily 'they of his own household' (Matt. x. 36. Cp. Matt. x. 21 and 35; Mark xiii. 12; Luke xii. 52–53 and xxi. 16), 'id . . . notandum est, fuisse in proscriptos uxorum fidem summam, libertorum mediam, filiorum nullam.'—Velleius Paterculus, C.: *Historia Romana*, Book II, chap. 67.

⁵ 'Victoris magis quam morientis vultum praeferens'—Velleius Paterculus, C.: *Historia Romana*, Book II, chap. 27.

⁶ Tacitus: *Agricola*, chap. 45.

leader Publius Vettius Scato. 'How am I to address you?' the Roman spokesman asks. 'As a would-be friend who is an involuntary enemy' the insurgent spokesman answers.¹ At that moment, perhaps, it was still not too late to arrest the Furies' flight; and there had been a time before that, again, when statesmanship might even have averted a catastrophe which, for a decade, was to turn all Italy into one vast gladiatorial amphitheatre. In the picture conjured up by Plutarch's words a twentieth-century English student could recapture a scene in the Roman politician Marcus Livius Drusus's house in the capital, towards the close of the first decade of the last century B.C., when Drusus's Marsian friend Quintus Pompeius Silo was spending a few days with him as his guest. He could watch the distinguished visitor making friends with his host's nephews and then saying to them, half in joke and half in whimsically tragic earnest: 'Do plead for us with your uncle; do beg him to make our cause his own in our struggle to win the franchise.'²

This resurrection, in a twentieth-century English student's experience, of souls that had striven and suffered and died in Italy in the second decade of the last century B.C. was noteworthy inasmuch as the bones which had been brought back to life were, in this instance, no perfect skeletons, but mere casual bits and fragmentary pieces. In conjuring up out of these scanty relics an exceeding great army, the historian's awe-inspired imagination was performing, on its own plane, something like an equivalent of the miracle performed on the intellectual plane by contemporary Western palaeontologists who knew how to reconstruct a megatherium from a single vertebra and a pithecanthropus from a single tooth. If the Imagination could strike fire from such tinder as surviving tables of contents of lost books and surviving entries in pedestrian chronicles, it was not surprising that it should be able to make as much of the intact works of gifted historians; and the same experience of a magical translation to a distant point-moment in Space-Time, which had overtaken the present student of History when he was reading the tables of contents of the lost books of Livy in A.D. 1911, was to overtake him again in A.D. 1951 when he was reading Bernal Diaz's description of his first sight of the approaches to Tenochtitlan.

'During the morning we arrived at a broad causeway and continued our march towards Iztapalapa; and, when we saw so many cities and villages built in the water and other great towns on dry land, and that straight and level causeway going towards [the city of] Mexico, we were amazed and said that it was like the enchantments they tell of in the legend of Amadis, on account of the great towers and *cues* [temples] and buildings rising from the water, and all built of masonry. And some of our soldiers even asked whether the things that we saw were not a dream. . . . I stood looking at it and thought that never in the World would there be discovered other lands such as these, for at that time there was no Peru, nor any thought of it. Of all these wonders that I then beheld, to-day all is overthrown and lost, nothing left standing. . . .

¹ 'Quem cum Scato salutasset, "Quem te appellem?" inquit. At ille "Voluntate hospitum, necessitate hostem".'—Cicero: *Philippicae*, Speech XII, chap. xi, § 27.

² "Αγε,, εἰπεν, "ὅπως ὑπερ ἡμῶν δεήσασθε τοῦ θεοῦ συναγωνίσασθαι περὶ τῆς πολιτείας.,—Plutarch: *Cato Minor*, chap. 2.

'Gazing on such wonderful sights, we did not know what to say, or whether what appeared before us was real; for on one side, on the land, there were great cities, and in the lake ever so many more, and the lake itself was crowded with canoes, and in the causeway were many bridges at intervals, and in front of us stood the great city of Mexico, and we—we did not even number four hundred soldiers! And we well remembered the words and warnings given us by the people of Huexotzingo and Tlaxcala, and the many other warnings that had been given that we should beware of entering [the city of] Mexico, where they would kill us as soon as they had us inside.'¹

The sense of personal participation in the Castilian expedition to Mexico in A.D. 1519, which the present writer experienced while he was reading this passage in Bernal Diaz's record of his reminiscences, had been anticipated when, in A.D. 1949, he was reading accounts of 'the Fourth Crusade' written by a gifted French and a cultivated Byzantine participant in that sordid transaction between two mutually antipathetic Christendoms.

At one moment he found himself on board a thirteenth-century French ship catching a thrilling first sight of Constantinople through Geoffrey de Villehardouin's eyes.

'Or poez savoir que mult esgarderent Costantinople cil qui onques mais ne l'avoient veue; que il ne pooient mie cuidier que si riche vile peust estre en tot le monde, cum il virent ces halz murs et ces riches tours dont ele ere close tot entor à la reonde, et ces riches palais et ces haltes yglices, dont il i avoit tant que nuls nel poist croire, se il ne le veist à l'oïl, et le lonc et le lé de la vile qui de totes les autres ere souveraine. Et sachiez que il n'i ot si hardi cui la chars ne fremist; et ce ne fut mie mervoille; que onques si granz affaires ne fu enpris de nulle gent, puis que li monz fu estorez.'²

At another moment the twentieth-century reader found himself in Nikítas Khoniátis' shoes, striding back, with his heart in his mouth, into the jaws of Death on the forlorn hope of trying to rescue a girl who had just been kidnapped by a Frankish soldier from among a party of Byzantine refugees that was heading for the Golden Gate in a perilous attempt to make an exodus from the ravished City.

'Our chief anxiety was for the women, so we had put them in the middle of our party with a cordon of men outside and had instructed the girls to smear their faces with dirt [in order to conceal their sexual attractions from the Frankish soldiery's eyes]. . . . We were bound for the Golden Gate; but, when we had got about as far as the church of Mocius the Martyr, a barbarian . . . snatched a beautiful girl from among us. She was a judge's daughter . . . and her father, whose stamina had been broken by old age and sickness, had slipped and fallen in a puddle and was now lying there crumpled up, lamenting aloud and plastered with mud. He kept on looking at me as if he were expecting at least some show of assistance from me, and he began to call upon me by name to do anything that I could to help him to retrieve his daughter. So I turned back there and then,

¹ Bernal Diaz del Castillo: *The Discovery and Conquest of Mexico, 1517-1521*, translated by A. P. Maudslay (London 1928, Routledge), pp. 269-71.

² Geoffroi de Villehardouin: *Conquête de Constantinople*, chap. xxvi, § 128 (3rd ed. of N. de Wailly's text and translation (Paris 1882, Didot), p. 72).

without more ado, and started to follow at the kidnapper's heels, weeping and denouncing at the top of my voice the crime that had just been committed. As I went, I made supplication to any passing soldiers of the Frankish army who were not altogether ignorant of our [Modern Greek] tongue—trying to induce them to come to the rescue and taking some of them by the hand, till I had managed to work upon the feelings of some of them so far as to prevail upon them to form a posse for the pursuit of that lecherous beast. I led the way with my posse behind me; we arrived at the villain's billet; and then he pushed the girl inside and took his stand at the gates in a truculent posture. . . . When my companions told him with some vigour to give the girl back, his first reply was an insolent refusal. Two imperious passions—lust and rage—had him fast in their grip; but, when he saw that the men were losing their tempers, and heard them threatening him with impalement for misconduct aggravated by contumacy, and when he was convinced that they were really in earnest, he reluctantly yielded and gave the girl up.¹

If the imagination could be fired not only by the Champenois adventurer's winged words but even by a narrative in a Byzantine historical work whose pages had been damped by the mildew of an affected style in a pedantic classical diction, it was still less surprising that the same miracle could also be evoked by the sight of monuments and landscapes that were visual echoes of the Past. In A.D. 1952 the writer of this Study had a vivid recollection of six such experiences in which he had found himself participating in an historic past event through a momentary annihilation of the intervening time on the hypnotizing spot.

On the 10th January, 1912, as he sat musing on one of the twin summits of the citadel of Pharsalus, with his eyes ranging away to the peaks of Pelion, Ossa, and Olympus over the downs of Cynoscephalae—the crouching Dog's Heads—the middle distance of a sunlit landscape came, in the brooding gazer's imagination, to be overcast with the sinister mist that, on a morning 2,109 years back in the Past, is blindfolding the patrols of two armies as these nervously grope their way towards one another on those fog-bound slopes. When the parting of the mist reveals to the posthumous spectator's sight the right wing of the Macedonian phalanx already carrying all before it in the momentum of its charge downhill, he instantly feels the stab of anxiety that, at this moment, pierces King Philip's heart as he glances back over his left shoulder to look for the left wing of the phalanx that should have been following his own right wing up. 'O form front, Nicânôr! Form front! And cover my left flank. Close the gap, Elephant, close the gap, for God's sake!' But the fate of Macedon's last army is already sealed. Don't you see what that hawk-eyed Roman field-officer is doing over there on the triumphant Roman right? He is not missing his chance of striking a decisive blow by waiting for orders from Titus. Look, he has already withdrawn two battalions from the victorious Roman attack on Nicânôr's unready wing and has wheeled them, left-about, at the double to take Philip's exposed wing in the rear. And now it is no battle; it is a massacre—for these uncouth Italian troops have never been

¹ Nikitas Khoniâtis: *Narrative of Events after the Capture of the City* [by the Franks], chap. 3, on pp. 779-82 of Immanuel Bekker's edition (Bonn 1835, Weber).

drilled in the humane rules governing the 'temperate and undecisive contests' in which the regular forces of a civilized Hellenic World are more or less innocuously exercised. Look, the outmanœuvred phalangites are raising their pikes—they are making the signal that they surrender—but those murderous Roman swords callously complete their cruel work.

As the harrowed participant from another world averts his eyes from an unbearable spectacle, they catch a glimpse of a despairing commander riding off, *ventre à terre*, with no more than a handful of life-guards still attending him. Is this fleeing horseman Titus Quinctius Flaminius's defeated adversary Philip Demetriou? Or is he Gaius Julius Caesar's defeated adversary Gnaeus Pompeius Magnus? Before the dreamer has time to refocus his diffracted historical vision, it all vanishes abruptly into thin air, and the landscape flickers back into a pastoral present in which the sounds floating up from the slopes of Cynoscephalae to the heights of the acropolis of Pharsalus are, not the din of sword-blades nor the shrieks of wounded men, but the tinkling of goat-bells and the bleating of sheep peacefully grazing, to the strain of their shepherds' pipes, over the site of a doubly historic battlefield. Can the dreamer really have sunk, for that instant, those twenty-one centuries deep below the current surface of Time's waters on which he now finds himself riding, once again, in his normal waking life? He might doubt it if the poignancy of the momentary experience had not left a sequence of Greek elegiac verses running persistently through his head.

Αἶλινον αἶλινον εἰπέ, κατήριπε δῶμα Φιλίππου·
αἶλινον, ἐξ ἐδάφους ὤλετο γῇ Μακεδῶν.
ἡ δὲ φάλαγξ ἔστρωται ἀνὰ στίχας, ὥς ὅτ' ἀμητῆρ
ἑστόρεσεν δρεπάνῳ Θεσσαλικὰς στάχνας—
ὥς ὄγμος κατὰ κόσμον ἐλήλαται αἰχμητῶν,
οὐδ' αὐτὸς κείνων τάξιν ἔλυσ' Αἴδης.
ἴσχει χεῖρ ἀμενηνὸς ἐῆς ἔτι θραῦμα σαρίσσης,
ἀσπίδα δ' ἀργυρέην λυθρὸς ἔβαψε μέλας.
τῶνδ' Ἀσίην πρόγονοι μὲν ἐπικρατέως ἐρατεινὴν
εἶλον, ὑπερφιάλοις κῆρες Ἀχαιμενίδαις·
νῦν δ' αὐτοῖς ἀτηρὸς ἀπὸ ζόφου ἦλθε τριακτῆρ,
αἰετὸς αἰπολοῖς, Ὀσκὸς ἀμαιμάκετος.
ἡ δ' Ἑλλὰς τρις ὀλωλ', αὐτόχθονος οὐκετι χειρὶ
κοιράνου ὀψομένη σκῆπτρον ἀνασσόμενον.¹

¹ The following translation of this Greek has been made for the writer by his friend Mr. John Lodge:

Ah! woe is me for Philip's house made void,
And woe for Macedonia's land destroy'd!
In swathes the phalanx fell, like ears of corn
By sickle of Thessalian reaper shorn:
So sank the warrior host, in strict array,
And Death himself shook not their ranks astray.
The nerveless hand its shatter'd pike retains,
And crusted gore the silver buckler stains.
Their fathers, born for Persians' overthrow,
Wrested fair Asia from that haughty foe;
But these, with western pow'r ill-match'd in fight,
Perish'd, as goats beneath an eagle's might.
Thrice fall'n is Hellas, never to behold
Her realm again by native prince controll'd.

At the east end of the Island of Crete on the 19th March, 1912, as he rounded the shoulder of the last mountain on his path from Khandrà to Palaíkastros, the same twentieth-century Western student of History suddenly sighted the ruins of a baroque villa¹—built, by the look of it, for one of the last of the Venetian governors of Candia—which, had it been erected on English and not on Cretan soil, would probably then still have been inhabited by the descendants of its original occupant, but which in Crete in A.D. 1912 was already a relic of 'Ancient History' on a par with the ruins of the Minoan imperial palace at Cnossos which the twentieth-century English wayfarer had been visiting a week since. As he stood staring at this Jacobean country house, where the Modern Western Civilization in which he himself lived and moved and had his being had suffered the pangs of death on Cretan soil a quarter of a millennium ago, the spectator had an experience which was the counterpart, on the psychic plane, of an aeroplane's sudden deep drop when it falls into an air-pocket. On that spot on which Time had stood still since the eviction of the Venetians by the 'Osmanlis in the War of Candia (*gerebatur* A.D. 1645–69),² the spectator was suddenly carried down in a 'Time-pocket' from a day in the year A.D. 1912 to a day in the fifth decade of the seventeenth century on which History, in that house, had come abruptly to an end in an evacuation without any sequel except solitude and decay.

'The spider has wove his web in the imperial palace, and the owl hath sung her watch-song on the towers of Afrasiab.'³

On the east coast of Laconia on the 23rd April of the same year 1912 the same wayfarer had a similar experience when he scaled the citadel of Monemvasía—'the Little Gibraltar' that had won this name from the isthmus which was its sole link with the mainland and had lent the same name to the 'malmsey' wine which had once been exported to Western Christendom from its quays. As he scaled those miniature Heights of Abraham and scrambled through a breach in the ramparts that crowned the summit, he fell again into the deep trough of Time as he beheld the antique bronze cannon lying tossed about at all angles among the jagged outcrops of limestone and the thorny macchia and the quietly browsing goats. There lay the guns as they had been left on a day on which Time had stood still at Monemvasia. They had lain there till their wooden carriages had rotted away, and no one had ever troubled to remount them or to carry them off. In that instant the spectator was transported to the evening of the day—whatever date that day

¹ This experience has been mentioned in this Study already, in different contexts, in XII. ix. 431, n. 2, and IV. iv. 282.

² See IV. iv. 278.

³ 'From Saint Sophia he [Mehmed the Conqueror] proceeded to the august but desolate mansion of an hundred successors of the Great Constantine, but which, in a few hours, had been stripped of the pomp of royalty. A melancholy reflexion on the vicissitudes of human greatness forced itself on his mind, and he repeated an elegant distich of Persian poetry.'—Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, chap. lxviii.

In a footnote, Gibbon observes that 'this distich, which Cantemir gives in the original, derives new beauties from the application. It was thus that Scipio repeated, in the sack of Carthage, the famous prophecy of Homer. The same generous feeling carried the mind of the conqueror to the Past or the Future.'

may have borne in Archbishop Ussher's chronological chart¹—on which this historic fortress had been stranded on the flowing Time-stream's motionless marge.

This experience of the present writer's at Monemvasia on the 23rd April, 1912, was duplicated on the 24th November, 1920, at the opposite end of the Continent, on a larger rocky peninsula, jutting out like a dagger into the Gulf of Chihli, which at that date was held on a lease from China by Japan.

'The strategic and commercial ports of the Leased Territory are not very distant from one another in Space. They stand on two notches, near the dagger's point, that form their harbours; and from notch to notch it is only about two hours' drive in a car. In "ideal" or "philosophic" time, however, they are far apart, and the distance between them is always widening. [While] Dairen is reaching out its hands towards a prosperous bourgeois future, Port Arthur stands fixed in one tragic moment of the Past. . . .

'As I stood on the heights along which the defences of the fortress had run, and let my eyes range over the landscape, I felt as I had felt when, on my way out to the Far East, my route had led me through Verdun a few months before. That landscape had never seen Mankind engaged on their normal works of peace. It had seen war, and war alone; and, now that the tide of war had ebbed away, the landscape had somehow ceased to be part of the actual living world. It was a landscape with no present, no future, and no function except to bear silent testimony to the tragedies of which it had been the scene in its great days, now for ever past.

'At Port Arthur there was one height in particular which commanded a magnificent view in both directions: inwards over the city and the harbour with its slit of an entrance guarded by bluffs on either hand; outwards over the open country across which the Japanese attack had been delivered. The Japanese had carried that height at fearful cost, and the Russians had lost it to their undoing, for, when once the Japanese artillery had opened fire from there, it had shot . . . the Russian fleet in the harbour and the whole Russian garrison to pieces, and the Russian commandant had had no choice but to capitulate.

'On the morrow of that capitulation, Time at Port Arthur had stood still. The place was still living—or lying dead—in that morrow when I

¹ At the time the spectator had taken it for granted that the spectacle which he was beholding in A.D. 1912 was the tableau of Monemvasia as the fortress had been left on the morrow of its recovery from the Venetians by the 'Osmanlis in A.D. 1715 (see IV. iv. 279); but investigation showed that Monemvasia had changed hands through a peacefully negotiated capitulation, and not through being taken by storm, both on the 7th-10th September, 1715, when the Venetians had surrendered it to the 'Osmanlis, and on the 5th August, 1821, when the 'Osmanlis had surrendered it to the Moreot Greek insurgents. The transactions that resulted in the surrender of Monemvasia on the 7th-10th September, 1715, are recorded by Brue, B.: *Journal de la Campagne que le Grand Vésir Ali Pacha a faite en 1715 pour la Conquête de la Morée* (Paris 1870, Thorin), pp. 53-7. The surrender of the fortress on the 5th August, 1821, is noticed in Finlay, G.: *A History of Greece from its Conquest by the Romans to the Present Time, B.C. 146-A.D. 1864*, vol. vi (Oxford 1877, Clarendon Press), p. 213. This testimony is explicit; yet, on the 23rd April, 1912, the citadel of Monemvasia wore the appearance of having been taken by assault at the moment when Time had come to a halt there. The writer could only conjecture that, either in A.D. 1715 or in A.D. 1821, the victors, after making their peaceful entry, had breached the wall and dislodged the guns from the embrasures in order to put the fortress permanently out of commission as an insurance against the risk of a re-occupation by enemy naval forces. An expert on Modern Western military technology would, no doubt, be able to tell at a glance whether these guns were of late seventeenth-century or of late eighteenth-century make.

visited it the other day. Nothing had happened at Port Arthur in between to break the spell and make the hands of the clock move forward again; and I remembered having had precisely that sensation long ago in another famous fortress far away.¹

This experience of communion with a tragic past event, which was imparted to one spectator at Monemvasía in A.D. 1912 and at Port Arthur in A.D. 1929, can hardly be escaped by any visitor to the battle-fields of Chattanooga and Gettysburg, where Time's spontaneous halt has been seconded by Man's artifice. At Gettysburg on the 21st April, 1947, when the same spectator was reconnoitring that tragic landscape, the guns that had been in action there on the 1st-4th July, 1863, were once more standing in battery in their authentic stations; for in this field the wooden gun-carriages which at Monemvasía had rotted away had been providently replaced by replicas in rustless metal. Gazing from the summits of the two Round Tops across no-man's-land to the Confederate lines, and then gazing across the same deadly intervening space in the opposite direction—from the point where Lee had stood to the clump of trees in the Federal lines which had been indicated to Pickett as his objective—the spectator felt once again a sensation which he had known in Liaotung and in the Morea. He was in momentary personal communion with his fellow human beings who had struggled and suffered and died on that field long ago; and, on the evening of the same day, he heard the story of a far more poignant experience than his own on the same enchanted spot. That evening Mrs. Hanson,² the wife of the President of Gettysburg College, who, like her husband, was of Southern birth, told him that, when, after her husband's appointment, she had found herself in Gettysburg for the first time and had been taken to see the battlefield, she had burst into tears at the sight. The emotion that had found this vent had welled up from deep springs; for this lady had had an uncle who had been one of the survivors of Pickett's charge. No description of the battle had ever come to her ears from this first-hand source, since her kinsman could never bring himself to speak of what he had witnessed in that terrible passage of arms; but his pregnant silence had initiated his niece in her childhood into a personal communion with the tragedy of the 3rd July, 1863; and, when, at last, years after, as a grown woman, she first set eyes on the scene of her uncle's and his fallen comrades' unspeakable ordeal, it was no wonder that her feelings should have overcome her.

The most vivid of the present writer's experiences of the local annihilation of Time in a place where Time had stood still had overtaken him at Ephesus on the 11th February, 1921.

'I approached Ancient Ephesus from the slopes of a limestone hill spangled with crimson anemones, gashed with the quarries from which the stones of the city were hewn, and crowned with the remnants of towers and curtain walls. I had chosen my direction so as to descend upon the theatre from above, and the view, suddenly disclosed, of the vast cavity, with the seats still in place and the stage buildings standing, was

¹ Toynbee, A. J.: 'Life and Life-in-Death', in *A Journey to China* (London 1931, Constable), pp. 200-6.

² Mrs. Elizabeth Trimble Painter Hanson.

as impressive as I had expected it to be. Beyond it the great central thoroughfare of the city, a streak of marble pavement showing up against the green of the plain, led down to the ancient harbour, now a reed-bed, yellow and brown. Parallel to the thoroughfare on our left stood the mountain of Coressus, with Lysimachus's fortifications on the sky-line. Beyond, on a separate and lower hill of limestone, stood "the Prison of Saint Paul", a tower in a salient of the city's defences. Beyond that again lay the sea, deep blue against the horizon, and to our right stretched the plain of alluvium which has choked the harbour and driven the sea away. The River Cayster, which built the plain and co-operated with the folly of Man to the city's undoing, wound like a snake in spiteful loops and curves through the feverish levels which it has laid down.¹

At the instant at which this historic panorama impinged on the spectator's eyes, the empty theatre peopled itself with a tumultuous throng as the breath came into the dead and they lived and stood up upon their feet. 'Some . . . cried one thing and some another; for the assembly was confused, and the more part knew not wherefore they were come together.'² Those two dishevelled figures must be Gaius and Aristarchus; that ineffectual-looking creature must be Alexander. What is this rhythmic roar into which the babel of tongues is resolving itself? Will Gaius and Aristarchus escape with their lives? Thank Heaven for the intrepid town clerk's promptness and presence of mind. But at the moment when the cries of 'Great is Diana' are dying down and the clerk is beginning to reason tactfully with the crowd, the life flickers out of the scene as the spectator is carried up again instantaneously to the current surface of the Time-stream from an abyss, nineteen centuries deep, into which the impact of the sight of the theatre at Ephesus had plunged him.

On each of the six occasions just recorded, the writer had been rapt into a momentary communion with the actors in a particular historic event through the effect upon his imagination of a sudden arresting view of the scene in which this long-past action had taken place. But there was another occasion on which he had been vouchsafed a larger and a stranger experience. In London in the southern section of the Buckingham Palace Road, walking southward along the pavement skirting the west wall of Victoria Station, the writer, once, one afternoon not long after the end of the First World War—he had failed to record the exact date—had found himself in communion, not just with this or that episode in History, but with all that had been, and was, and was to come. In that instant he was directly aware of the passage of History gently flowing through him in a mighty current, and of his own life welling like a wave in the flow of this vast tide. The experience lasted long enough for him to take visual note of the Edwardian red brick surface and white stone facings of the station wall gliding past him on his left, and to wonder—half amazed and half amused—why this incongruously prosaic scene should have been the physical setting of a mental illumination. An instant later, the communion had ceased, and the

² Acts xix. 32.

dreamer was back again in the every-day cockney world which was his native social milieu and of which the Edwardian station wall was a characteristic period piece.

A sense of personal communion with all men and women at all times and places, which outranges the gamut of an historian's prose, is articulate in a poem which was already familiar and dear to the writer of this Study at the time when that ineffable experience travelled through him.

Men laughed in Ancient Egypt, long ago,
And laughed beside the Lake of Galilee,
And my glad heart rejoices more to know,
When it leaps up in exultation too,
That, though the laughter and the laugh be new,
The joy is old as is the ancient sea.

Men wept in noble Athens, so they say,
And in great Babylon of many towers,
For the same sorrows that we feel to-day;
So, stranded high upon Time's latest peak,
I can with Babylonian and with Greek
Claim kinship through this common grief of ours.

The same fair moon I look upon to-night,
This shining golden moon above the sea,
Imparts a richer and more sweet delight
For all the eyes it did rejoice of old,
For all the hearts, long centuries grown cold,
That shared this joy which now it gives to me.

Whate'er I feel I cannot feel alone.
When I am happiest or most forlorn,
Uncounted friends whom I have never known
Rejoicing stand or grieving at my side,
These nameless, faceless friends of mine who died
A thousand years or more e'er I was born.¹

'Wherefore, seeing we also are compassed about with so great a cloud of witnesses, let us lay aside every weight, and the sin which doth so easily beset us, and let us run with patience the race that is set before us.'² The runner has not yet reached his goal; for the experience, which only poetry can convey, of the unity of the spirit in the bond of peace³ is the revelation of a fellowship which is not the work of men⁴ but is an act of God; and God's presence and participation transfigure a precarious Brotherhood of Man into a Communion of Saints in which God's creatures are united with one another through their union with their Creator.⁵

Quae fessis requies, quae merces fortibus,
Cum erit omnia Deus in omnibus!⁶

'Vere Jerusalem est illa civitas';¹ for, in this full and perfect communion, man is reconciled with man, and Mankind with Non-Human Nature.

O happy living things! No tongue
Their beauty might declare:
A spring of love gushed from my heart,
And I blessed them unaware.²

In this rapture with which the love of God transfigures a human heart, Saint Francis preaches the Gospel to the birds and finds in the Sun and Moon his brother and his sister.

Luna, dies et nox et noctis signa severa
noctivagaeque faces caeli flammaeque volantes,
nubila sol imbres nix venti fulmina grando³—

this spectacle of the majesty of the stellar cosmos, which captivates a poet's imagination, racks a philosopher's mind with anxiety for fear lest the awe which this sight will inspire in unsophisticated human hearts may re-subdue these to the tyranny of mischievous divinities whom a Philosophy Militant has interned in the intermundia after banishing them from a world which they have malevolently infested.⁴

Nam cum suspicimus magni caelestia mundi
templa, super stellisque micantibus aethera fixum,
et venit in mentem solis lunaeque viarum,
tunc,⁵

while the philosopher is shaking his head, the saint breaks out into jubilation.

Altissimu onnipotente bon Signore,
Tue so le laude, la gloria e l'honore e onne benedictione.
Ad Te solu, Altissimu, se confanno,
Et nullu homo ene dignu Te mentovare.
Laudatu si', Mi Signore, cum tucte le Tue creature,
Spetialmente messor lu Frate Sole,
Lo quale lu jorno allumeni per nui;
Et ellu è bellu e radiante cum grande splendore:
De Te, Altissimu, porta significatione.
Laudatu si', Mi Signore, per Sora Luna e le Stelle;
In celu l'ai formate clarite e pretiose e belle.
Laudatu si', Mi Signore, per Frate Ventu,
E per aere e nubilo e sereno e onne tempu,
Per le quale a le tue creature dà sustentamentu.⁶

The Heavens declare the glory of God, and the Firmament showeth his handiwork.

One day telleth another, and one night certifieth another.

There is neither speech nor language, but their voices are heard among them.

Their sound is gone out into all lands, and their words into the ends of the World.

⁶ Saint Francis of Assisi: *Laudes Creaturarum*, ll. 1-14.

In them hath He set a tabernacle for the Sun, which cometh forth as a bridegroom out of his chamber, and rejoiceth as a giant to run his course. . . .

The Law of the Lord is an undefiled law, converting the Soul; the testimony of the Lord is sure, and giveth wisdom unto the simple.¹

O All ye Works of the Lord, bless ye the Lord; praise Him, and magnify Him for ever. . . .

O ye Heavens, bless ye the Lord; praise Him, and magnify Him for ever. . . .

O ye Sun and Moon, bless ye the Lord; praise Him, and magnify Him for ever.

O ye Stars of Heaven, bless ye the Lord; praise Him, and magnify Him for ever.

O ye Showers and Dew, bless ye the Lord; praise Him, and magnify Him for ever.

O ye Winds of God, bless ye the Lord; praise Him, and magnify Him for ever. . . .

O ye Nights and Days, bless ye the Lord; praise Him, and magnify Him for ever. . . .

O all ye Whales and all that move in the waters, bless ye the Lord; praise Him, and magnify Him for ever.

O all ye Fowls of the Air, bless ye the Lord; praise Him, and magnify Him for ever.

O all ye Beasts and Cattle, bless ye the Lord; praise Him, and magnify Him for ever.

O ye Children of Men, bless ye the Lord; praise Him, and magnify Him for ever. . . .

O ye spirits and souls of the Righteous, bless ye the Lord; praise Him, and magnify Him for ever.

O ye holy and humble men of heart, bless ye the Lord; praise Him, and magnify Him for ever.²

Nostrum est interim mentem erigere
Et totis patriam votis appetere.³

We praise Thee, O God; we acknowledge Thee to be the Lord.

All the Earth doth worship Thee, the Father Everlasting.

To Thee all angels cry aloud, the Heavens and all the Powers therein. . . .

Heaven and Earth are full of the majesty of Thy glory.

The glorious company of the Apostles praise thee.

The goodly fellowship of the Prophets praise thee.

The noble army of Martyrs praise thee.

The Holy Church throughout all the World doth acknowledge Thee.⁴

As these diverse yet concordant voices awoke in the heart of a twentieth-century Western historian who had been born and brought up in London, their human rendering of the heavenly language of a Communion of Saints called up before his inward eye a human presentation of the Beatific Vision in a picture in the National Gallery in Trafalgar Square which had printed itself on his imagination before the current century of the Christian Era had begun to run. On the altarpiece

painted by Fra Angelico for the Church of San Domenico at Fiesole the Angels, Patriarchs, Prophets, Saints, and Martyrs stand in their companies,¹ *prasiai prasiai*,² worshipping Christ in His glory in their midst.

Das Unzulängliche,
Hier wird's Ereignis;³

and the Communion of Saints thus made visible is an unspoken call to prayer.

Christe, audi nos.

Christ Tammuz, Christ Adonis, Christ Osiris, Christ Balder, hear us, by whatsoever name we bless Thee for suffering death for our salvation.

Christe Jesu, exaudi nos.

Buddha Gautama, show us the path that will lead us out of our afflictions.

Sancta Dei Genetrix, intercede pro nobis.

Mother Mary, Mother Isis, Mother Cybele, Mother Ishtar, Mother Kwanyin, have compassion on us, by whatsoever name we bless thee for bringing Our Saviour into the World.

Sancte Michael, intercede pro nobis.

Mithras, fight at our side in our battle of Light against Darkness.

Omnes Sancti Angeli et Archangeli, intercedite pro nobis.

All ye devoted bodhisattvas, who for us your fellow living beings and for our release have forborne, aeon after aeon, to enter into your rest, tarry with us, we beseech you, yet a little while longer.

Sancte Joannes Baptista, intercede pro nobis.

Noble Lucretius, who, in spite of thyself, art also a forerunner of the Saviour, instil thy poetry into our hearts and thy sincerity into our understandings.

Omnes Sancti Patriarchae et Prophetæ, intercedite pro nobis.

Valiant Zarathustra, breathe thy spirit into the Church Militant here on Earth.

Sancte Petre, intercede pro nobis.

Tender-hearted Muhammad, who art also one of the weaker vessels of God's grace, pray that His grace may inspire us, like thee, to rise above our infirmity in our zeal for His service.

Sancte Paule, intercede pro nobis.

Blessed Francis Xavier and Blessed John Wesley, continue Paul's work of preaching the Gospel in all the World.

Sancte Joannes, intercede pro nobis.

Blessed Mo-ti, disciple of Christ before Christ's epiphany in a far country, transmit thou too the message of Love that an Unknown God hath revealed to thee.

Omnes Sancti Apostoli et Evangelistæ, intercedite pro nobis.

Strong Zeno, help us to find God by playing the man. Pious Confucius, help us to do our duty towards God by doing it towards our neighbours.

¹ Mark vi. 39.

² Mark vi. 40.

³ Goethe, *Faust*, ll. 12106-7.

Sancte Stephane, intercede pro nobis.

Blessed Socrates, also a martyr, show us, like Stephen, how to suffer death in perfect charity towards those that despitely use us.

Omnes Sancti Martyres, intercedite pro nobis.

All ye who have been persecuted for righteousness' sake without leaving a memorial, teach us too to suffer without expectation of even a posthumous earthly reward.

Sancte Gregori, intercede pro nobis.

Blessed Açoka, who, like Gregory, didst serve God by feeding His sheep, teach us also to bear one another's burdens.

Sancte Augustine, intercede pro nobis.

Jalāl-ad-Dīn Mawlānā, singing reed, make heavenly music for us as the breath of God's spirit pours through thee.

Sancte Pater Benedicte, intercede pro nobis.

Epicurus, who wast likewise the revered founder of a spiritual family, impart to us thy gracious gifts of sweetness and light.

Sancte Antoni, intercede pro nobis.

Marcus, recluse in the palace and hermit in the camp, teach us too to make the flight of the Alone to the Alone amid the bustle of this busy World.

Omnes Sancti Monachi et Eremitae, intercedite pro nobis.

All ye who have also served God, though ye were uncloistered and unwithdrawn, teach us too how to be in the World yet not be of it.

Sancta Maria Magdalena, intercede pro nobis.

Blessed Francis, who for Christ's sake didst renounce the pride of life, help us to follow Christ by following thee.

Omnes Sancti et Sanctae Dei, intercedite pro nobis;

For *ilayhi marji'ukum jamī'an*: to Him return ye every one.¹

XIII. B (iii), ANNEX

A BUSINESS SCHOOL OF INTELLECTUAL ACTION

If, as has been argued in the chapter to which this annex attaches, action is the Alpha and Omega¹ of scholarship, no less than of 'practical' affairs, this accounts for the remarkable fact that a high proportion of an effective minority of scholars in divers fields, including the field of History, has been recruited, not from among the professional Scribes and Pharisees in an orthodoxly academic walk of life, but from publicans and sinners who have taken their intellectual action as amateurs after having served a laborious apprenticeship in such 'practical' trades as war, law, politics, and, notably, commerce. If the essence of scholarship is action, the first and last requirement for success in scholarship is to be *aktionsfähig*; and, accordingly, a 'practical' profession in which a neglect to take action spells instant disaster is a surer training in the essentials of scholarship, as well as in those of 'practical' business, than an academic profession in which the nemesis of inactivity is not immediately brought home to a hesitant soul by a disastrous event.

In a previous context² we have already taken note of the careers of a pleiad of historians and a band of poets, sages, and saints who returned to a life of action on the spiritual plane after having withdrawn from it on the 'practical' plane on which they had served their apprenticeship. Clarendon and Ibn Khaldūn were lawyer-statesmen in retreat. Polybius was a politician who had been deported and interned, Dante one who had been sentenced to exile, and Ollivier one who had fallen into disgrace. Machiavelli was a rusticated, Confucius an unemployed, and Saint Gregory the Great a retired, civil servant. Josephus was a prisoner-of-war and Saint Ignatius Loyola an invalided soldier, while Thucydides and Xenophon were soldiers in exile. Muhammad and Solon were retired business men. Our previous observations on these men of action who had qualified for entering on their spiritual activities by first going through a 'practical' apprenticeship need not be recapitulated here; but it is pertinent to our present inquiry to remind ourselves that the personal careers of seven out of the eight eventual historians on our previous list all follow one uniform pattern. Their withdrawal, temporary or permanent, from 'practical' life had, in every case save Ibn Khaldūn's, been involuntary. Every one of them had taken to History as a *pis aller* to occupy an enforced and unwelcome vacation from some form of 'practical' activity;³ and, when, thanks to their 'practical' training in action,

¹ Rev. i. 8 and 11.

² In III. iii. 263-332.

³ This statement needs some qualification in its application to Thucydides, since he tells us himself in the first sentence of his work (in Book I, chap 1) that he 'started work on it immediately after the outbreak of war, in the expectation that this war would not only be a great one but would be the most important that had ever yet been fought'. The historian's *raison d'être* was, no doubt, a public duty which he took as a matter of course. It is true that he did not welcome the twenty years' period of full-time leisure for concentrating on his historical work to which he was

they made a conspicuously greater success on the intellectual plane of action than they had formerly made in 'practical' life, we may guess that most of them were surprised to find that an activity which had been thrust upon them by a personal misfortune had won them fame besides bringing them consolation. We may now go on to take note of another set of eventual historians recruited from the world of 'practical' affairs—the business world in four cases and the world of law and politics in the fifth—whose careers, in three instances out of the five, conform to the same pattern externally, but prove, when we probe beneath the outward events to the inner psychic realm of ideals, aims, motives, and feelings, to have been, not congruent with, but actually antithetical to, the careers of the seven historians-in-spite-of-themselves whom we have already taken into account.

Outwardly there is a striking correspondence in pattern between the careers of Thucydides, Xenophon, Polybius, Josephus, Machiavelli, Clarendon, and Ollivier and the careers of George Grote (*vivebat* A.D. 1794–1871), Heinrich Schliemann (*vivebat* A.D. 1822–90), and James Ford Rhodes (*vivebat* 1848–1927). These three careers, like those seven, can all be analysed into a strophe, in which a 'practical' profession makes the first call—and this an exacting one—upon the hero's time and energy, and an antistrophe, in which he devotes himself to scholarship; and in these cases again, as in those, the break between the two symmetrically balanced chapters of personal history is likewise marked by a caesura. It is significant, however, that, in the broken careers of a Rhodes, a Grote, and a Schliemann, the caesura is one of the hero's own making.

Though Schliemann's career can challenge comparison, on the score of eventfulness, with that of any other hero known to History, neither the Victorian London banker Grote nor the post-Bellum Cleveland coal and iron merchant Rhodes was ever in danger of having his life-caesura cleft for him by so sensational an intervention of History in action as Josephus's experience of being taken prisoner, Polybius's of being deported, Thucydides', Xenophon's, and Clarendon's of being exiled, or even Machiavelli's and Ollivier's milder mishaps of being rusticated and of falling into political disgrace. Like Schliemann, Grote and Rhodes had to contrive for themselves an indispensable *vitai pausa*¹ that was never provided for them, ready-made, by the alarums and excursions of contemporary public life. Schliemann, as we have already noticed,² insulated his strophic accumulation of a fortune from his anti-strophic excavation of Troy and Mycenae by spending two years, after he had wound up his business at St. Petersburg in A.D. 1864, on travelling round the globe and writing, *en voyage* across the Pacific, a book that had for its subject neither self-help nor Homer, but China and Japan.³ Grote's equivalent step, after he had refrained in A.D. 1841 from

condemned through being exiled from Athens as his penalty for having failed in 424 B.C. (see Book IV, chaps. 104–7) to prevent the capture of Amphipolis-on-Strymon by a Lacedaemonian expeditionary force under Brasidas' command.

¹ Lucretius: *De Rerum Natura*, Book III, l. 860.

² On p. 16, n. 1, above.

³ See Ludwig, E.: *Schliemann of Troy* (London 1931, Putnam), pp. 117 and 118–19.

standing again for Parliament¹ and had made up his mind to concentrate on the writing of *A History of Greece* in the country, was to arrange—though he did not find this easy—to absent himself from his bank in the City of London between October 1841 and April 1842 and to spend the interval on visiting Italy for the first time in his life²—a temporary release from a ‘chain’³ of public and private ‘practical’ duties which was made absolute when he retired from business in the summer of A.D. 1843.⁴ Rhodes, after retiring from business at Cleveland, Ohio, in A.D. 1886, spent a year in Europe before settling down to write, first at Cambridge, Massachusetts, and afterwards, on the other side of the same Charles River, in Boston, *A History of the United States from the Compromise of 1850 to the Final Restoration of Home Rule at the South in 1877*.

‘If this seemed a singular way of starting literary work, it was certainly shrewd; it effaced the office from his mind; it made a complete break between the two widely different halves of his life and enabled him to launch upon the second section with a fresh, free mind. Incidentally too, while abroad, he translated a French novel, writing it out carefully with the design of shaping his style and familiarising himself with the art of composition. Then upon his return he entered at once upon the real work of his life.’⁵

Thus the careers of our three *ci-devant* business men resembled those of our seven *ci-devant* soldiers and statesmen in being symmetrically divided into strophes and antistrophes by caesuras; but, in noticing that the three business men’s caesuras had to be induced artificially because they were not imposed by events beyond the hero’s control, we have already put our finger on the inner antithesis between two patterns of life that are congruent only outwardly. For Schliemann and for Grote, as for Rhodes, ‘the real work of his life’ was the creative intellectual work that he achieved mainly or entirely during the post-caesuran chapter, and the ‘practical’ affairs to which he had been indentured during the pre-caesuran chapter had been a ‘chain’ that had held him back from devoting himself to the work on which his heart was set, whereas each of our seven soldiers and statesmen had found ‘the real work of his life’ in the pre-caesuran chapter of it and would never have abandoned ‘practical’ affairs for historiography if his creative destiny had not been imposed upon him by the ruthless stroke with which his ‘practical’ activities had been cut short by the shears of the cosmic weaver at the humming loom of Time.⁶ Each of our seven soldiers and statesmen became an historian in spite of himself during the second half of his career, while

¹ See Grote, H.: *The Personal Life of George Grote* (London 1873, John Murray), pp. 140–1, for the text of Grote’s letter announcing his decision not to stand again, to J. Travers, and Travers’ letter to W. E. Gladstone, in which it is stated that ‘Grote’s retirement is his own act, and he is inexorable upon the point’. How happy Ollivier, Clarendon, Machiavelli, and Thucydides would have counted themselves if any of their supporters could have given the same account of the circumstances in which they had taken their departure from public life.

⁶ Goethe: *Faust*, II. 501–9, quoted in II. i. 204 and in V. vi. 324.

each of our three business men remained a business man in spite of himself during the first half of his career.

On the criterion of the hero's own intentions, desires, and feelings, the antithesis is extreme; and the cosmic weaver's performance in eventually making a great scholar out of every one of these raw souls is all the more impressive. The conclusions to be drawn from this performance are clear. For a scholar who desires nothing better than to be one, just as much as for a scholar who has been made into one by *force majeure*, 'practical' affairs must be a magnificent apprenticeship for creative intellectual work; and the reason why they have this virtue must be because they give the future historian an effective preliminary training in a life of action which is the scholar's true life as well as the business man's, the statesman's, and the soldier's.

This sovereign virtue of being men of action was shared by our three *ci-devant* business men, not only with our seven *ci-devant* soldiers and statesmen, but also with two lawyer-statesmen-historians, Ibn Khaldūn (*vivebat* A.D. 1332-1406) and Lord Bryce (*vivebat* A.D. 1838-1922), and with a banker-scholar, Walter Leaf (*vivebat* A.D. 1852-1927), who, in contrast to all the others, managed to drive 'practical' activities and creative intellectual work in double harness throughout their working lives.¹ 'Schliemann was always more of a fighter than a thinker, a man of action rather than of contemplation; and so, even in later life, his letters and speeches were more arresting than his books. . . . He was entirely a man of action and not of letters.'² 'The very next morning' after his first arrival in Ithaca in July 1868, 'his inborn impulse towards action came to the fore; about 5 a.m. he climbed the peak' of Mount Aëtos 'with four workmen. . . .'³ 'Bryce, with his boundless energy and his ubiquity, had the general characteristics of a man of action rather than of a scholar. Even his books were planned and sketched in the open air and on the move more than in the study'⁴—and indeed we have noticed already⁵ that Bryce's perennial curiosity to add to his ever growing fund of information was harnessed to a self-set yet faithfully followed agenda in which the writing of books, and not the reading of them, was the scholar-statesman's business. As for Walter Leaf, his recognition of the truth that intellectual, as well as commercial, work is action is on record in his own words. 'Until the thought is definitely

¹ In Leaf's life this contemporaneous pursuit of a pair of diverse activities was a conscious and deliberate policy, as he has recorded in the opening paragraph of an unfinished autobiography printed at the beginning of his wife Charlotte M. Leaf's book *Walter Leaf* (London 1932, John Murray), p. 1:

'I have always been conscious of a double strain in my own mental make-up: a double strain which it has been my conscious aim to foster and to realise in a fair and even balance throughout my whole life. . . . The markedly contrasted characters of my two grandfathers . . . typified . . . the combination, in one of their descendants, of two sides of active life: the administrative and the studious or reflective. It has always been my desire to prove myself true to the tradition of my father's family—Yorkshire men of action, successful men of business—and at the same time not to lose hold of the literary and scholastic vein which seems to have been handed down to me by the inheritance of my maternal grandfather, who was, a hundred years ago, one of the best Greek scholars of his day.'

formulated, it is nothing', he once wrote in a posthumously printed paper;¹ and, after he had accepted in A.D. 1878 an invitation from the publishing house of Macmillan to finish the work on an edition of Homer that had been left incomplete owing to the death by misadventure of a friend of his who had begun it, 'he lost no time in starting'² and wrote in his diary:³ 'It is a comfort to me to think that I am at length employed . . . on something that somebody wants done, and not merely on the dilettante acquisition of knowledge.'

It is noteworthy that, in this vital point of emerging from an apprenticeship in business as effective men of action, the two Homerists Leaf and Schliemann should have been kindred souls, because the native temperament of the indigo merchant who took Life by storm presents a piquant contrast to that of the silks and ribbons merchant who, while admitting *sotto voce* that, 'if a task is forced upon me, and I am convinced of its rightness, I can carry it out with a good deal of executive capacity',⁴ declares, with a characteristic modesty, that 'I have never had a real ambition except to try to carry out to the best of my power the duty which was present to me at the moment.'⁵

The flair for action which inspired these 'practical men' in their intellectual activities, as well as in their businesses, reveals itself in the methods of self-education that they worked out. Schliemann, for example, who would have been a prodigy as a linguist alone, even if he had neither excavated Troy nor made a financial fortune, succeeded in mastering at least twelve foreign languages—though, so he declares, 'my memory was bad, since from my childhood it had not been exercised upon any object'—by always making some active use of the language that he was studying.

'Necessity taught me a method which greatly facilitates the study of a language. This method consists in reading a great deal aloud without making a translation, taking a lesson every day, constantly writing essays upon subjects of interest, correcting these under the supervision of a teacher, learning them by heart, and repeating in the next lesson what was corrected on the previous day. . . . I never went on my errands, even in the rain, without having my book in my hand and learning something by heart.'⁶

Thus Schliemann was preaching what he himself had practised when he advised a friend not to retire from business unless he had a hobby.

'You will make an enormous mistake if you think that good reading will give you adequate occupation. You will get sick of it. But, now I remember, you are a violinist, bravo! bravissimo! That will make it all right. Only you must devote yourself passionately to music, play at concerts, compose, practise day and night.'⁷

On this principle Schliemann, when he dared at last to allow himself to learn Greek, taught himself by learning passages of the classics by heart and then composing in the language himself.

⁶ Quoted in Ludwig, op. cit., p. 283.

⁷ See *ibid.*, p. 150.

'I learnt Ancient Greek [he tells us] as I would have learnt a living language. I can write in it with the greatest fluency on any subject I am acquainted with.'¹

Schliemann's biographer Ludwig subsequently tested Schliemann's claim by obtaining, from a specialist in Oriental languages, an expert opinion² on the extant books of exercises in manuscript by which Schliemann had taught himself, not only Greek, but, shortly after, Persian, Arabic, and Turkish. The specialist found, to his astonishment and admiration, that Schliemann's self-taught method of learning a new language enabled him, after six weeks' study, 'to express his thoughts both orally and in writing'. In the first letter³ that he wrote in Greek, Schliemann writes of it as 'the language of my waking thoughts and of my dreams'; and his biographer afterwards found in these Greek exercise-books—which 'represent the veritable monologue of a merchant who longed to escape into the realm of the ideal'—'documents of greater psychological value than any that are to be found in the whole accumulation of thousands of papers which Schliemann collected and preserved'.⁴

In short, Schliemann's prescription for learning a language was to do something with it, and it is significant that his method should have been adopted independently by Grote and by Rhodes. Rhodes, as we have noticed,⁵ deliberately prepared himself, when the time came, for his long-since intended enterprise of literary composition in his mother tongue by translating a French book into English. As for Grote,

'it was . . . a surprise to me [Mrs. Grote records in her account of their first day at Verona in A.D. 1841] when I heard Grote suddenly break forth in a new language, which he apparently employed with facility, questioning our attendant on all the points which attracted his curiosity . . . Within a day or two of our arrival in Rome . . . Grote engaged a master in order to familiarise himself with the Italian tongue—to which end he translated, as best he could, English comedies into Italian, *viva voce*, for an hour daily.'⁶

Though Grote's respect for what Schliemann called 'the tedious rules of grammar'⁷ was characteristically greater⁸ than Schliemann's, he was at one with his younger contemporary in habitually going into action in his studies as well as in his business, and, for him as for Schliemann, the method that he employed in learning a language was merely an application of a constant habit that seems never to have deserted him save once, in the critical winter of A.D. 1833-4.⁹ 'The amount of notes, scraps, extracts, and dissertations which he wrote . . . attests the eager appetite for knowledge which devoured him';¹⁰ and his wife's observation is borne out by her future husband's own record in her extracts¹¹

from his diary between the 22nd September, 1818, and the 28th March, 1819.

The story of George Grote is not the least remarkable of our ten instances in which an outstanding piece of creative intellectual work has been the outcome of a 'practical' training; for, in the temperament of this banker-historian, there was perhaps enough of 'the leaven of the Pharisees'¹ to have inhibited him from intellectual achievement if his father had not been so selfish as to plant him, before he was sixteen years old,² at a desk in the family bank in Threadneedle Street instead of allowing him to complete his academic education by going up to the University. Indeed, Grote's native tendency towards intellectual dissipation was evidently so strong that it may be doubted whether even his enforced apprenticeship in banking would have secured him his intellectual salvation if his wife had not joined forces with his business to induce him to persevere in a self-discipline which is the prerequisite for effective action in any field.

After his father had forced him into the family banking-business, Grote divided the small margin of time still left to him for cultural activities, in which he had not ceased to put his treasure, between learning to play the violoncello, learning German, and studying Economics, History, and Metaphysics;³ not content with this, he threw himself into the movement for establishing the University of London and became, in A.D. 1827, one of the original members of the Council;⁴ and, though he did give up the 'cello in A.D. 1830,⁵ the liberty that he took with the personal freedom that was bequeathed to him before the end of the same year by the death of his selfish and tyrannical father⁶ was to allow himself to be sucked into parliamentary politics on the wave of the contemporary movement in Great Britain for parliamentary reform, and not to retire from business in order to concentrate upon the writing of a history of Greece which he had adopted, perhaps as early as A.D. 1822, as the theme for a future *magnum opus*.⁷ From the time of his plunge in A.D.

⁷ Mrs. Grote claims that the decision to write a history of Greece was taken by her husband, at her suggestion, late in A.D. 1823.

⁸ Towards the autumn of the year 1823, Mrs. Grote, hearing the subject of Grecian history frequently discussed at their house in Threadneedle Street, and being well aware how attractive the study was in her husband's eyes, thought it would be a fitting undertaking for him to write a new History of Greece himself. Accordingly she propounded this view to George Grote: "You are always studying the ancient authors whenever you have a moment's leisure; now here would be a fine subject for you to treat. Suppose you try your hand!" The idea seemed acceptable to the young student, and, after reflecting for some time, he came to the resolution of entering upon the work. His studies became chiefly directed towards it from that time forward. The quantity of materials which he accumulated in the form of "notes" and extracts during his preparation for the History (which have been preserved by the care of his wife), give evidence of his industry, and of the deep interest he felt in his self-appointed task' (Grote, H., op. cit., pp. 49-50).

This account of the genesis of Grote's great work is contradicted, however, by another piece of evidence that also comes from Mrs. Grote's pen. In a letter to G. Warde Norman, written by her in October 1823, she mentions that 'the Grecian History prospers, and G. is more absorbed in it than ever. He has nearly concluded the account of the Greek colonies'—i.e. chapters 22 seqq. of the Second Part of the History as eventually

1830 into politics down to the time of his eventual retirement first from politics in A.D. 1841 and then from business in A.D. 1843, the wife who was also the Egeria of the historian *in posse* was in constant anxiety for fear lest her husband might throw away an intellectual destiny that had long been manifest to her eyes by an intemperate dissipation of his energies.

"The "History of Greece", she wrote in her note-book on the 1st February, 1831, a few weeks before Grote's acceptance of an invitation from the Lord Mayor of London to stand for one of the seats in Parliament allocated to the City, 'must be given to the public before he can embark in any active scheme of a political kind. . . . His reputation must be created by the "opus magnum" (as John Mill calls the "History").'¹

And her failure to prevail upon her husband to give his literary work priority over politics was followed by a realization of her fears. After Grote's election to Parliament in December 1832, 'the History was laid on the shelf',² and on the eve of the parliamentary session of A.D. 1834 Mrs. Grote wrote in her notebook:

'G. did not apply himself, as I earnestly besought him, to the furtherance of his History during the winter, but permitted himself to graze about the field of letters—a propensity with which he is not in general reproachable, having usually had distinct objects in view in his studious hours. This winter he has indulged in all manner of promiscuous reading, and has written fewer memoranda in connection with books than I ever recollect him to have done in the same period. I very much apprehend that he will continue this desultory habit of reading, and feel it painful to resume the old labours to which he once applied himself with fond attention and sustained energy. I see, too, a growing demand in his mind for the acquisition of Physical Science, Geology and Chemistry in particular.'³

In thus taking alarm at the eruption, in the potential historian's mind, of an unregulated appetite for an aimless omniscience, this indomitable woman of action by proxy was not at fault; for her husband's symptoms were veritably those of a soul that is on its way to intellectual perdition. The cause of this intellectual calamity was, of course, not far to seek. The strain that Grote had imposed on himself by playing an active part in the parliamentary session of A.D. 1833 while continuing to be the responsible managing partner in the family banking business had exhausted, in these 'practical' activities, even the exceptional capacity for action with which this banker-politician-historian had been endowed by nature; and, after this excessively severe ordeal, his intellect's overtaxed bow instinctively protected itself by refusing to be rebent for overtime employment on intellectually creative work. But the diagnosis of the malady did not make it any the less alarming. 'This unremitting labour towards public objects made me', his wife recalls,⁴ 'complain not infrequently of the sacrifice; but Grote was inflexible' till his gradual disillusionment with practical politics became at last sufficiently acute to move him to write, as he wrote in February 1838: 'I now look wistfully

printed (see Momigliano, A.: *George Grote and the Study of Greek History* (London 1952, Lewis), p. 7, with n. 12 on p. 21).

² Ibid., p. 75.

³ Ibid., p. 87.

¹ Grote H., op. cit., p. 67.

⁴ Ibid., p. 101.

back to my unfinished Greek history. I hope the time will soon arrive when I can resume it."¹

The notable feature of the sequel was not that Grote eventually recoiled from the politics of which he had, by then, had his fill to the historiography at which, by A.D. 1843, he had been shying for at least twenty years; the feature that made the ending of Grote's story a happy one after all was that, during the last twenty-nine years of his life (A.D. 1842-71), he proved himself to be a Solomon by duly building his temple after having, for the preceding twenty years, been doing his worst to incapacitate himself for playing the intellectual man of action's part by lingering over David's preliminary task of assembling Solomon's building materials.² Grote and his wife had no sooner returned to England from their caesuran five months' visit to Italy in A.D. 1841-2 than Grote 'now methodically laid out the scheme of his first two volumes, as the real basis of his long-contemplated "History of Greece"'.³ During the first half of the year 1843, when he was still responsible for the affairs of the bank, 'few days passed in which he did not devote at least eight hours to the composition of the "History"'.⁴ The winter of A.D. 1845 found him 'getting the first two volumes through the press, whilst continuing the writing of the third and fourth'.⁵ 'Grote never deviated from his system of daily labour; he retired, after breakfasting at 9.0 a.m., to his library, whence he rarely emerged until the afternoon hours'.⁶ The last proofs of the twelfth and concluding volume were returned to the printer on the 23rd December, 1855.⁷

The honours for the historian's eventual attainment of a goal that he had set for himself more than thirty-two years back have to be divided between the hero, his wife, and his banking business in proportions which could have been assessed only, perhaps, by Mrs. Grote; and she has not divulged this information; but the spectator of a Victorian drama whose denouement was the eventual triumph of intellectual purposiveness over intellectual dissipation in the hero's soul can see that the happy ending was the fruit of discipline—whatever the source from which this discipline may have been derived. When, in A.D. 1864, Grote went on, without a pause, to start work upon his book on Aristotle as soon as he had sent his book on Plato to the press,⁸ a friend said to Mrs. Grote, on hearing from her of this,

'Grote's intellectual course always seems to me to resemble the progress of a planet through the firmament: never halting, never deviating from its onward path, steadfast to its appointed purpose; it quite impresses one with wonder!'⁹

Discipline is, indeed, the key-note of the lives of all these successful men of intellectual action, and it shows itself to the greatest effect in their disciplined use of their time. They displayed a capacity for persisting, over periods amounting to as much as half or three-quarters of a normal working lifetime, in the pursuit of long-term intellectual

⁹ See p. 20, above.

objectives; and, meanwhile, they wrung from a working life that was mainly occupied with 'practical' duties a modicum of leisure for employment in gradually approaching a distant intellectual goal by teaching themselves how to lay out and economize their time to best advantage in the daily round.

Even Grote, who was perhaps the weakest vessel among these iron wills, was able, after all, to summon up the staying-power to abide by his decision to write a history of Greece for at least twenty years before he began to put it into execution and for twelve years more before the work was complete. James Ford Rhodes held to his purpose for twenty-six years before setting to work in A.D. 1887 on the writing of his *History of the United States from the Compromise of 1850*, and for no less than sixty-one years till the publication, in A.D. 1922, of a final volume carrying the story down to A.D. 1909, if it is true

'that even in school days he had conceived the purpose of writing American history, and, as the Civil War was then waging, he saw tempting material in rapid and exciting creation around him, whereby the scheme inevitably took ever more and more powerful hold upon his imagination.'¹

In Schliemann's life a Time-interval of thirty-nine years separated the date of his resolve, in A.D. 1829, to excavate Troy from the date of his first assault upon the mound at Hisārlyq in A.D. 1868. Bryce lived to accomplish the writing of the most ambitious of all his works, *Modern Democracies*, though the unforeseen interruption of the work on his literary agenda by the calls of public duty during the First World War had prevented him from putting pen to paper on this long-since planned and persistently cherished literary project till he was eighty years old. And these heroically self-disciplined characters showed the same steadfast patience in biding their time for taking their principal intermediate steps towards the achievement of their eventual objectives as in pushing forward their saps and traverses, decade by decade, towards these ultimate goals.

Schliemann, for example, could have put his marvellous linguistic gift to work in mastering the Ancient Greek language at any time after that memorable day in A.D. 1837² on which he had listened, spell-bound, to the recitation of Homeric verses which were then still unintelligible to him; and Greek was, in fact, 'the first language he learnt for other than practical purposes',³ though it was the tenth out of the twelve that he taught himself from first to last.⁴ Yet, just because his craving to drink

¹ Morse Jr., J. T.: 'Memoir of James Ford Rhodes', in the *Proceedings of the Massachusetts Historical Society*, October 1926-June 1927, vol. lx (Boston 1927), p. 178. The memoir continues: 'Now Mr. Rhodes was, by his nature, a very wise man. Already, while still so near to the outset of life, he showed that sound good sense and wideness of vision which come to most of us, when fortunately they come at all, so many years later. He had no notion of being too eager, of making a start before he was sure of being able to hold on. So he held his ardour well in hand until all desirable preparations were fully completed and he could devote all his mind and all his hours to his writing.'

² See p. 15, above.

³ Ludwig, E.: *Schliemann of Troy* (London 1931, Putnam), p. 104. At the bank for buying gold-dust which Schliemann set up at Sacramento, California, in A.D. 1851, he conducted, according to his own account, in eight languages a business at which he was working every day from 6.0 a.m. to 10.0 p.m. (Ludwig, op. cit., p. 90).

⁴ See p. 15, above.

of this cup was so strong, Schliemann deliberately refrained, for nearly nineteen years, from raising it to his lips.

'My wish to learn Greek had always been great, but before the Crimean War I did not venture upon its study, for I was afraid that this language would exercise too great a fascination over me and estrange me from my commercial business, and during the war I was so overwhelmed with work that I could not even read the newspapers, far less a book. When, however, in January 1856, the first tidings of peace reached St. Petersburg, I was no longer able to restrain my desire to learn Greek, and at once set vigorously to work.'¹

Even, however, after he had thus, at long last, opened the flood-gates, his iron will still availed to regulate the aperture.

'My recreation [he wrote to his sister] is languages, to which I am bound by a consuming passion. During the week I am continuously occupied in my counting-house, but on Sundays I sit from early morning until late at night over Sophocles, whom I am translating into Modern Greek.'²

The same hero of the life of intellectual action showed a comparable self-restraint in postponing his indulgence in a visit to the land of Troy. The business man who commanded the financial means of transporting himself from St. Petersburg to California as early as A.D. 1850 manifestly had it in his power financially to visit the Troad, from that year onwards at latest, at any time that he might choose. Yet he deliberately postponed his first visit till A.D. 1868, when his self-equipment with the financial and intellectual sinews of archaeological war was at last complete, though in the meantime he had travelled round the globe in A.D. 1864-5³ and had previously come as close to Troy as Smyrna and the Cyclades in A.D. 1859.⁴ Walter Leaf, likewise, had it financially in his power to do his field-work in the Troad for at least as many years as Schliemann had had the same coveted archaeological objective within his financial reach before he had allowed himself to make his first pilgrimage to his poetic imagination's Mecca. Yet Leaf did not carry out his survey of the Troad till A.D. 1911, twenty years after his election in A.D. 1891 to be a director of the London and Westminster Bank had made him a man of means, and eight years after a first tantalizing glimpse of Troy on a three-weeks' holiday cruise in A.D. 1903 had left a mental wake of 'memories of Troy seething behind him'.⁵ The obstacle that compelled this scholar-banker to draw these long drafts upon his patience was an inability to find, not the requisite financial means, but the requisite length of continuous spare time for temporary release from those day-to-day financial responsibilities in the City of London which were the scholar's penance for drawing the banker's remuneration,⁶ and

³ See Schliemann, *Ilios*, p. 18; Ludwig, *Schliemann*, pp. 118-19.

⁴ See Schliemann, *Ilios*, p. 16; Ludwig, *Schliemann*, pp. 115-16.

⁵ Leaf, C. M.: *Walter Leaf* (London 1932, John Murray), pp. 201 and 203. Leaf had a second brief glimpse of Troy in A.D. 1910 (see *ibid.*, p. 325).

⁶ This necessity, under which Leaf had found himself, of waiting for eight years in order to obtain the necessary leisure for making his survey of the Troad was mentioned by him casually in the course of a conversation with the present writer in A.D. 1913; and an exercise of patience, which the seasoned man of commercial and intellectual action

Leaf the scholar may perhaps have had moments of envying a Cambridge or Oxford don for his leisure as wistfully as a don with children to educate might at times have envied Leaf the banker for his income.

George Grote, in his day, had already met, in his own double life, with the same difficulty in obtaining leave of absence from the banker-spider's parlour for the scholar-fly. In A.D. 1827 Grote had, in fact, been compelled by the exigencies of his duties in Threadneedle Street to cancel a plan (for which another opportunity never afterwards presented itself) of visiting at Bonn the German historian B. G. Niebuhr;¹ and he continued to be thus tightly chained to business for the next fourteen years. 'Up to this time', writes Mrs. Grote, in chronicling their five-months' tour in Italy in A.D. 1841-2, 'the inexorable conditions of our position forbade the idea of distant travel';² and, even at this stage in his career, by when he had been at work in the family bank for thirty-one years and had been 'the real working partner' for twenty-five,³ Grote had to make an advance-payment to his partners—a payment, not of money, but of time—for the luxury of a five-months-long vacation.

'In order to execute this (to us) vast programme, Grote had to earn the leisure required by giving a close attendance, during the months of July, August, and September [1841], at the banking house; his partners, William Prescott and Charles Grote, taking their respective holidays in the interval. This arrangement necessitated the passing much time in London, both George and his wife sleeping in town four or five nights of every week during the whole summer.'⁴

Even then, 'Grote was bound to be in England again early in April [1842] for the bank dividends'.⁵

The self-discipline that thus declared itself in a patient, as well as steadfast, pursuit of distant intellectual objectives would not, of course, have borne fruit if it had not also been exercised simultaneously in a day-to-day regimen that made it possible for the scholar business man to advance along his self-appointed intellectual path at the tortoise's slow but sure gait.⁶

Leaf, for example, ascertained by experiment in September 1875, at a moment when, on the threshold of his career in business, he was preparing himself for the second time to take the examination for a fellow-

manifestly took as a matter of course, made a deep impression on the mind of a young Oxford don on whose subjective Time-scale, in his twenty-fifth year, a span of eight years seemed a veritable aeon.

¹ Grote, H., op. cit., pp. 51-52.
² Grote, H., op. cit., p. 143. 'The annihilation of distance' through the progress of Western technology in an Industrial Age of Western history, into which Grote as well as Leaf had been born, did not proceed quite fast enough to shorten their periods of waiting to make their pilgrimages by shortening the length of the time required for 'the round-trip'. In A.D. 1841-2 there was not yet any through connexion by railway between Calais and Rome, and in A.D. 1911 not yet any through connexion by air between London and Constantinople.—A.J.T.

³ George Grote had been 'the real working partner' since A.D. 1816 (Grote, H., op. cit., p. 46) and had gone into the bank before his sixteenth birthday, i.e. in A.D. 1810.

⁴ Grote, H., op. cit., p. 143.

⁵ Ibid., p. 151.

⁶ 'Nothing surely is so potent as a law that may not be disobeyed. It has the force of the water-drop that hollows the stone. A small daily task, if it be really daily, will beat the labours of a spasmodic Hercules. It is the tortoise which always catches the hare. . . . Constancy in labour will conquer all difficulties.'—Trollope, Anthony: *Autobiography*, chaps. 7 and 20.

ship at Trinity College, Cambridge,¹ that he could do hard intellectual work for six hours a day but not for more.

'This I have always taken as a rule in after life. Needless to say that this does not apply to the ordinary round of more or less mechanical routine which, with most people, passes for work; I am speaking only of real attention, of real thinking, which is the most exhausting of all the occupations of life. . . . But there is a great relief if the attention is not solely concentrated on one subject, and if it is possible to divide it between two. By limiting my deliberate attention during the hours of business in the day and filling up my time with the amount of routine which is always coming in, I have always found it possible to turn in the evening with a fresh mind to study or writing for as much as two or three hours with profit; and it is this alternation of employments which has enabled me to carry on two interests side by side through all my life. . . . I used to retire to my study after dinner and read or write, often up till midnight, and I am inclined to think—though I never timed myself—that for considerable spells I managed to get through my maximum of six hours a day, divided between the office and the study, in addition to an uncertain amount of mere routine in the office which hardly counted.'²

Grote, at any rate in his twenties, found the time for his daily intellectual work mostly not after dinner but before breakfast, to judge by the extracts, printed by Mrs. Grote,³ from a 'diary kept by George Grote, Junior, in order to keep Miss Lewin [the future Mrs. Grote] informed of his way of life during the early period of their engagement'. The consumption of an amazing quantity of formidably solid

¹ In October 1875 Leaf duly won, at this second attempt, an award which was the highest intellectual distinction open to a graduate of the University of Cambridge. With characteristic good feeling, he resigned his fellowship after a few months because he had a conscientious objection to drawing remuneration for a sinecure (see Leaf, C. M., op. cit., pp. 125 and 126).

² Walter Leaf, in the fragment of autobiography printed in C. M. Leaf, *Walter Leaf*, pp. 123-4. Cp. Mrs. Leaf's own observations *ibid.*, on pp. 148 and 225. The advantages of an alternating regimen of intellectual work had likewise been discovered by John Stuart Mill, who served in the office of the Examiner of India Correspondence in the India House for thirty-five years (1823-58)—for the last two years as chief of the office—and then retired only because he was not in sympathy with Parliament's action in liquidating the East India Company and transferring its political and administrative functions to the Crown.

'I was in a few years qualified to be, and practically was,' Mill writes in the third chapter of his *Autobiography*, 'the chief conductor of the correspondence with India in one of the leading departments, that of the Native States. This continued to be my official duty until I was appointed Examiner, only two years before the time when the abolition of the East India Company as a political body determined my retirement. I do not know any one of the occupations by which a subsistence can now be gained, more suitable than such as this to anyone who, not being in independent circumstances, desires to devote a part of the twenty-four hours to private intellectual pursuits. . . . For my own part I have, through life, found office duties an actual rest from the other mental occupations which I have carried on simultaneously with them. They were sufficiently intellectual not to be a distasteful drudgery, without being such as to cause any strain upon the mental powers of a person used to abstract thought, or to the labour of careful literary composition.'

Anthony Trollope's concurrence on this point with John Stuart Mill is impressive, considering the diversity in temperament between these two good civil servants who both managed also to be distinguished men of letters in their very different lines.

'If it be necessary for you to live by your work, do not begin by trusting to literature. Take the stool in the office. . . . and then, in such leisure hours as may belong to you, . . . persevere in your literary attempts. . . . Such double toil, you will say, is severe. Yes; but, if you want this thing, you must submit to severe toil. . . . More than nine-tenths of my literary work has been done in the last twenty years, and during twelve of those years I followed another profession.'—Trollope: *Autobiography*, chaps. 11 and 20.

³ In op. cit., pp. 28-37.

intellectual pabulum is recorded between the first entry—'Tuesday, 22nd September, 1818. Rose at 7. Read Say for a couple of hours'—and the last:

'Sunday, 28th March, 1819. Rose at $\frac{1}{2}$ past 5. Studied Kant until $\frac{1}{2}$ past 8, when I set off to breakfast with Mr. Ricardo. Met Mr. Mill [senior] there, and enjoyed some most interesting and instructive discourse with them, indoors and out (walking in Kensington Gardens), until $\frac{1}{2}$ past 3, when I mounted my horse and set off to Beckenham. Was extremely exhausted with fatigue and hunger when I arrived there, and ate and drank plentifully, which quenched my intellectual vigour for the night. Bed at $\frac{1}{2}$ past ten.'¹

'The habits of work were not relaxed after Grote's settling in Threadneedle Street as a married man. . . . A bell was . . . fixed in our bedroom, and duly rung at 6.0 a.m. by the private watchman,² in order to secure Grote's getting up at that hour';³ and, indeed, 'Rose at 6' are the opening words in six out of eight entries in Grote's journal chronicling his intellectual work before breakfast from the 3rd to the 10th December, 1822, inclusive.⁴

The nineteenth-century English banker-historian's daily regimen had been anticipated by a Persian contemporary of Dante's, Rashīd-ad-Dīn al-Hamadānī, who contrived, by making good use of a minimum of spare time, to write the *ǧāmi'-al-Tawārīkh* ('A Comprehensive Collec-

¹ This day-long intellectual orgy of Grote's in Kant's, Ricardo's, and Mill's company on a Sunday was, of course, no more typical of the intellectual hero's normal time-table on a week-day than were Schliemann's Sunday revels in Sophocles' company. The following entry is a characteristic sample of Grote's regimen on a working day.

'Saturday, 13th March [1819]. Rose at $\frac{1}{2}$ past 7, after a sleepless night. Read some of Hume's essay on the Academical Philosophy. Breakfasted, and rode to London, where I found a letter from my dearest H., which gave me great delight, as also one from Miss Hale. Went to Guildhall twice this day to prove some debts. Between 4 and 5 read some more Kant. Dined at $\frac{1}{2}$ past 5; played on the bass; drank tea at $\frac{1}{2}$ past 7; then passed the evening in studying Kant, and writing down some remarks which occurred to me. Journalised the last three days, and went to bed at 11' (*ibid.*, p. 35).

² This regimen of the banker-historian Grote's was emulated by the civil servant novelist Anthony Trollope. 'It was my practice to be at my table every morning at 5.30 a.m., and it was also my practice to allow myself no mercy. An old groom, whose business it was to call me, and to whom I paid £5 a year extra for the duty, allowed himself no mercy. During all those years at Waltham Cross he was never once late with the coffee which it was his duty to bring me. I do not know that I ought not to feel that I owe more to him than to anyone else for the success I have had. By beginning at that hour I could complete my literary work before I dressed for breakfast.'—Trollope: *Autobiography*, chap. 15.

³ Grote, H., *op. cit.*, p. 48.

⁴ See *ibid.*, pp. 48–49. Edward Gibbon, during his voluntary spells of residence in his father's country house at Buriton, had likewise found himself goaded into making time for intellectual work by early rising, under pressure, not of a family business, but 'social' demands on his time.

'At home I occupied a pleasant and spacious apartment; the library on the same floor was soon considered as my peculiar domain, and I might say with truth that I was never less alone than when I was by myself. My sole complaint, which I piously suppressed, arose from the kind restraint imposed on the freedom of my time. By the habit of early rising I always secured a sacred portion of the day, and many scattered moments were stolen and employed by my studious industry. But the family hours of breakfast, of dinner, of tea, and of supper were regular and long: after breakfast Mrs. Gibbon expected my company in her dressing-room; after tea my father claimed my conversation and the perusal of the newspapers; and in the midst of an interesting work I was often called down to receive the visit of some idle neighbours. Their dinners and visits required, in due season, a similar return; and I dreaded the period of the full moon, which was usually reserved for our more distant excursions.'—*The Autobiographies of Edward Gibbon* (London 1896, Murray), Memoir B, pp. 162–3. Cp. Memoir C, p. 286.

tion of Histories') while he was Prime Minister in an Il-Khānī Mongol Government—'if we may accept as good evidence his own testimony, cited by Dawlatshah,¹ that the interval between dawn and sunrise was the only time when he was able, after having said his prayers and performed some religious exercises, to occupy himself with the writing of his history, since every other moment was consecrated to affairs of state'.² Rashīd-ad-Dīn has also put it on record that he accomplished a great deal of historical writing by turning to it in spare moments of his official working day.³ 'He was so avaricious with his time that, even during journeys, when he was actually in the saddle, he did not cease to meditate on topics that were of sufficient importance to make it necessary for him to give them a mature consideration.'⁴

Leaf, in spite of his practice of sitting up late, was also, like Rashīd-ad-Dīn and Grote, an early riser—as witness the entry: '2nd April, 1894. . . Up at 6, as usual, to look out of window.'⁵ But this English banker-scholar of a younger generation than Grote's was tempted into rising early by the lure, not of Kant or Say, but of the sunrise and the birds.⁶

These business men who became eminent scholars were at the same time outstandingly successful in their businesses. Schliemann demonstrated his giftedness in this field by making his fortune in spite of having started without a penny; but Grote, Rhodes, and Leaf, who were not pricked by the spur of penury, all likewise made their mark in the business world. 'I have reason to know', Mrs. Grote records,⁷ 'that the reputation of George Grote as a competent and wise banker became at this period [circa A.D. 1828-9] generally acknowledged, and that the result was an extension of the business of the house in Threadneedle Street.' Rhodes 'found himself possessed of a comfortable fortune, and absolutely free to do what he would',⁸ by A.D. 1886, by when he had spent seventeen years in the family business; and during this commercial strophe of his life he made a strong enough impression on his

³ See Quatremère, *ibid.*, p. lxii.

⁴ Quatremère, *ibid.*, pp. lviii-lix. Compare C. Plinius Secundus the Younger's account, in his *Epistulae*, Book III, Ep. v, of his uncle and namesake Pliny the Elder's habits of work. 'He used to begin to work by lamp light on the Volcanalia [23rd Aug.] . . . getting up while it was still pitch dark. In the winter he used to get up at 1.0 a.m. or, at the latest, at 2.0 a.m., and often at midnight. . . . Before daybreak he used to wait on the Emperor Vespasian (another night-worker) and then go straight on to his office. After getting home, he would devote what was left of his time to study. . . . On the road he would put all business out of his mind and would attend to his studies exclusively; at his elbow he would have a secretary armed with book and writing-pad, and in winter also with mittens to protect his hands, to make sure that even the inclemency of the season should be powerless to rob his master of any of his time for study. For the same reason my uncle used, in Rome, to go about in a sedan chair. I remember his once taking me to task for going on foot, "You might", he said, "have saved those hours". He counted all time lost that was not given to study. . . . So avaricious was he with his time.'

⁵ Leaf, C. M., *op. cit.*, p. 181.

⁶ Like Grote, Leaf was fond of music, and mountaineering was another of his recreations. Grote, for his part, was a keen cricketer (see Grote, H., *op. cit.*, p. 14).

⁷ In *op. cit.*, p. 59.

business associates, by his prowess on ground shared by him with them, for one of them, long after the scholarly antistrophe to Rhodes' business career had made the *ci-devant* coal merchant famous in a world that was not theirs, to have 'remarked regretfully, when his name was mentioned: "I knew Mr. Rhodes very well in the old days. He was highly thought of. What a pity he dropped out, for he would have made his reputation."' ¹ Walter Leaf, who in A.D. 1875 had taken on his shoulders the burden of an ailing family business immediately after finishing his education at Cambridge, did both make and keep his reputation in the City of London by the success with which he acquitted himself of his thankless initial task on Old Change. The perpetual growth of the esteem in which he was held in the business world was registered in his successive appointments to the chairmanship of the London Chamber of Commerce in A.D. 1887, to a directorship of the London and Westminster Bank in A.D. 1891, to the deputy chairmanship of the same bank in A.D. 1909, and finally, in A.D. 1918, to the chairmanship of this rapidly growing business concern. ² So long as Leaf lived, no City man could ever have imagined that this eminent banker had 'dropped out' of the business world, though there may have been some City men who were no more alive than Rhodes' former business associate was to the versatile man of action's fame in a non-commercial sphere of activity. Conversely, Leaf may have had contemporaries in the world of classical scholarship who were unaware that he was anything more than one of themselves; for 'Walter Leaf was undoubtedly one of the outstanding figures among the classical scholars of his generation. . . . He became the recognized authority on his special subject, and his output, both in quality and [in] quantity, would have been remarkable even for a professional scholar with no other occupations; for a man busy all his life in other spheres it was little short of miraculous.' ³

What was the secret of a miracle that was performed, not only by Walter Leaf, but likewise by George Grote, Heinrich Schliemann, James Ford Rhodes, and James Bryce? It was the old secret of a stuttering Demosthenes' miraculous self-transfiguration into a golden-mouthed public speaker. It was the response of a soul charged with a creative intellectual mission to the challenge of a 'practical' profession that must disappoint its apprentice of his hopes of attaining his intellectual objective if he did not take heroic measures to meet this threat of frustration. This was the life-story even of Bryce and Rhodes, who had embraced a 'practical' career deliberately without having been pushed into this by any external pressure. *A fortiori* it was the life-story of Schliemann, Grote, and Leaf, who were all victims, in various ways and degrees, of faults or failings of their fathers.

The Pastor Ernst Schliemann's sins against his son were more flagrant than the banker George Grote Senior's or the merchant Charles John

¹ Grant, Robert, in the *Proceedings of the Massachusetts Historical Society*, October 1926-June 1927 (Boston 1927), p. 125.

² The London and County Bank had been amalgamated with the Westminster Bank in A.D. 1909, and Parr's Bank was amalgamated with the London County and Westminster Bank in A.D. 1918 (Sir Montagu Turner in C. M. Leaf, op. cit., pp. 301-2).

³ Bailey, Cyril in C. M. Leaf, op. cit., p. 317.

Leaf's. The pastor's profligacy cost his famous son Heinrich the loss of his childhood's sweetheart Minna Meineke by shocking the Schliemanns' neighbours into ostracizing the whole family after the premature death of Heinrich Schliemann's cruelly wronged mother; and it also cost Heinrich Schliemann the best part of the education which would have been a pastor's son's normal start in life. Yet this long debit column against Pastor Ernst Schliemann's name is partly offset by credits which neither George Grote Senior nor Charles John Leaf could claim. George Grote Senior 'had no sympathy with learning',¹ while the intellectual inspiration that Walter Leaf received from his father² was faint compared with that which Heinrich Schliemann received from his—not to speak of the automatic physical heritage of vitality which Pastor Ernst Schliemann expended on setting Nature at defiance by prolonging a dissolute life to the age of ninety,³ leaving it to his son Heinrich Schliemann to employ a transmitted fund of energy in making his fortune, mastering twelve foreign languages, and excavating Troy and Mycenae.⁴

Of three business men who took intellectually promising sons into partnership—George Grote Senior, Charles John Leaf, and Daniel Pomeroy Rhodes—the last-named alone comes out of the transaction with credit. There is no suggestion that James Ford Rhodes' entry into the family business was anything but the young man's own spontaneous choice, and no suggestion, either, that, thereafter, the father exercised any cramping tyranny over his son's private life. (It is significant, for example, that, in A.D. 1872, only three years after his entry into the family business in A.D. 1869, James Ford Rhodes made the happy marriage for which Grote and Leaf were both constrained to wait.) On the other hand there is a piece of presumptive evidence suggesting that James Ford Rhodes' father may have done something to inspire his son with the resolve—which the future historian is said to have formed in his boyhood⁵—one day to write a history of his country's contemporary tragedy; for Daniel Pomeroy Rhodes had been one of the leading Douglasite delegates from the North-West at the fateful convention which the Democratic Party had held at Charleston, S.C., on the 23rd April–1st May, 1860.⁶ As for the other two partner-fathers, George Grote Senior was a selfish tyrant and Charles John Leaf a pathetic invalid.

The historian-banker's father put George Grote Junior into the family business before his sixteenth birthday in order to make sure of being able to pass his own time in indulging his personal tastes by leading the conventional life of a country gentleman.⁷ He obstructed for nearly five years (A.D. 1815–20) his son's wish to marry.⁸ He then made his consent

conditional on the young couple's living in a house adjoining the bank in Threadneedle Street (a condition which, in Mrs. George Grote Junior's belief, was responsible for the premature delivery and swift death of her child and for an attack of puerperal fever that was all but fatal to its mother).¹ And, though the younger Grote had become 'the real working partner' in A.D. 1816,² his father, till his death in A.D. 1830, 'appropriated the greater portion of the profits which fell to the Grote family, allowing his eldest son no more than just sufficient to keep him from incurring debts.'³ This paternal tyranny was odious, yet George Grote's tribulations under it were perhaps hardly more severe than the trials brought upon Walter Leaf by a breakdown of his father's health which exposed a dutiful son to the more exacting tyranny of his own scrupulous conscience and tender heart.

In the same year A.D. 1874 in which Walter Leaf's father's health gave way, Walter's uncle Frederick died of cancer, and, since his uncle William had already died in A.D. 1871, the family business unexpectedly found itself bereft of all three partners of the older generation.⁴ In these tragic circumstances, which in themselves were enough to put crushing moral pressure upon a sensitive member of the rising generation, Walter Leaf's father appealed to him to come to the family's rescue; and the son 'deliberately accepted the offer of a place in the business with all the consequences', though he 'regarded it from the first as a disagreeable duty'.⁵ The consequences were indeed severe for him; for, in contrast to George Grote Junior, who had taken over a family business at a time when the openings for it had been favourable, and who had then been left free by his father to use his opportunities and abilities in making a success of it, as he did, at his own discretion, so long as he provided his father with sufficient profits from it, Walter Leaf was taking over a family business which was already in decline and which, as was to be proved by the event, ought to have been sold at that stage, and he had to spend the first eighteen years of his business life (A.D. 1875-93) in bearing, as 'counting house partner', the brunt of a losing battle before his father—who did not forbear to interfere with his son's management after he had become incapable of exercising the responsibility himself⁶—could be induced to waive his sentimental objections to amalgamating with another firm.⁷ It was not until he was invited in A.D. 1891, sixteen years after his first entry into the City, to join the Board of the London and Westminster Bank, that Walter Leaf found his way at last into a business career that was congenial to him. Meanwhile, his sense of duty towards his parents led him not only to spend eighteen years of his working life (A.D. 1875-93) on the thankless task of keeping the family business afloat, but also to refrain for nineteen years (A.D. 1875-94) from marrying.⁸

The painfulness of these frustrating sacrifices on the planes of per-

sonal and professional life drove both George Grote Junior and Walter Leaf to seek consolation in intellectual activities. 'Looking forward to a commercial course of life, certain to prove uninteresting in itself', Grote 'resolved to provide for himself the higher resources of intellectual occupation'.¹ 'I made no pretence of liking the drudgery', Walter Leaf wrote, in retrospect, of his entry into the family business in A.D. 1875, 'but it had to be faced; and from the very first day I determined that it should not make me forget the higher intellectual interests'.² 'My dead friends in *Calif and Russia*', George Grote Junior wrote to G. W. Norman in May 1819, 'still continue faithful and interesting, and, if it were not for them, life would be a very waste indeed'.³ 'Only Homer keeps me going' and 'I have taken to work as some men would have taken to drink—to drive away my thoughts'—are two of the entries in Walter Leaf's diary in A.D. 1879.⁴ 'These are they which came out of great tribulation';⁵ for, in the event, Grote and Leaf were, not warped, but stimulated, by their ordeal.

'Soon the pruning of those years was to blossom out all the more vigorously for its ruthless suppression. Does not the gardener prune the rose tree? This same process, which in Walter's life meant a rigid cutting-back, strengthened every fibre of his being for what followed when once his wings were free to soar.'⁶

As for Schliemann,

'while . . . he had railed against the fate of a youth spoilt by his father's irregular life, he did not realise the strength of the impetus which a long artificially obstructed stream can gather before it at last breaks forth.'⁷

Nor are the intellectual benefits of personal and professional tribulations solely negative. An ordeal that stimulates the intellect by challenging it also gives it a positive schooling in open-mindedness, judiciousness, perceptiveness, and an art of communicating ideas to other minds which is an indispensable intellectual accomplishment for a human social animal and is at the same time the most arduous stage in the process of literary composition. Sir Arthur Evans⁸ notices in Schliemann that 'his old intense faculty of self-repression came out again in his later campaigns at Troy, where, in spite of much inward repugnance, he at last submitted to "scientific methods"'; and Cyril Bailey⁹ similarly notices in Leaf 'the eagerness with which, while retaining his general outlook, he would welcome every kind of new light, and the courage with which he could abandon any theory which he felt to be no longer tenable'. John Torrey Morse Junior, in his appreciation of James Ford Rhodes and his work,¹⁰ notices that Rhodes never succumbs, as Macaulay does, to a temptation to embroider at inordinate length

his descriptions of picturesque incidents, and he suggests an explanation of Rhodes' workmanlike sense of proportion.

'Is it possible that his cool self-restraint was indirectly due to the long years of his business training? . . . Business teaches what may be called a clean-cut way of thinking; impulse is absolutely discarded; an accurate knowledge of exact facts is essential; due weight must be allotted among colliding suggestions. In short, the study given to the matter in hand must be both exhaustive and dispassionate.¹ Such had been Mr. Rhodes' mental training for many years; and it had shaped the way in which he contemplated his subject matter. . . . I strongly incline to believe . . . that Mr. Rhodes' score of years in mere practical business were of substantial advantage to him when he came to write the annals of a great multitude of very hard and conflicting facts.'

Besides thus exercising the judgement, business practice can also sharpen the intuition. In noticing that Schliemann divined at first glance which was the true site of Troy, Emil Ludwig² cites Herder's remark to Goethe: 'With you the eye is everything'; and he goes on to comment:

'This rapid, keen, surveying, collating eye was characteristic of Schliemann; and it cannot be denied that a decade spent in looking over stocks, samples, steamships, and warehouses trains the eyes better than the study of the opinions of a hundred experts when, before digesting them, the archaeologist has never been himself to the place concerned.'

As for the training that business practice gives in the social art of conveying ideas, John Stuart Mill³ observes, of his experience at the India house, that

'it was valuable to me by making me, in this portion of my activity, merely one wheel in a machine, the whole of which had to work together. As a speculative writer, I should have had no one to consult but myself, and should have encountered in my speculations none of the obstacles which would have started up whenever they came to be applied to practice. But, as a secretary conducting political correspondence, I could not issue an order or express an opinion without satisfying various persons, very unlike myself, that the thing was fit to be done. I was thus in a good position for finding out by practice the mode of putting a thought which gives it easiest admittance into minds not prepared for it by habit; while I became practically conversant with the difficulties of moving bodies of men, the necessities of compromise, the art of sacrificing the non-essential to preserve the essential. I learnt how to obtain the best I could, when I could not obtain everything.'⁴

This practical philosophy, into which Mill the logician was thus inducted by Mill the India House clerk, is more likely to inspire effective intellectual action than the impossibilism of the grammarian who, in

¹ In this respect, a practical career has the same effect in the province of public administration as in that of private business. 'The occupation accustomed me to see and hear the difficulties of every course, and the means of obviating them, stated and discussed deliberately with a view to execution' (Mill, J. S.: *Autobiography*, chap. 3 *ad finem*).—A. J. T.

² In op. cit., p. 140.

⁴ Mill, J. S.: *Autobiography*, chap. 3 *ad finem*.

Robert Browning's poem, is carried to his grave *ré infectâ* as the penalty for his hybris in playing for 'all or nothing'.¹

The value of a self-education in practical affairs had been borne in upon the present writer by an experience of his own that had made a deep and lasting impression on his mind. On the 18th-20th November, 1911, *en route* from Brindisi to Athens on his first visit to Greece, he had fallen into conversation with a young American of his own age who was one of his fellow-passengers on board the s.s. *Mykâli*. By that time the writer had been studying Latin for fifteen years, Greek for twelve and a half, and Hellenic history for two and a half intensively, and, on the last day of the voyage, as the boat steamed up the Gulf of Corinth and then through the canal into the Saronic Gulf, he was enjoying the thrill of identifying one feature in the landscape after another: the twin mountains Chalcis and Taphiassus, planted side by side like a pair of gigantic baetyls *vis-à-vis* Patras; Panachaicus wreathed in clouds; Parnassus followed by Helicon and confronted by Cyllênê; Acrocorinthus standing erect at the head of the Gulf; and, as a climax to this perpetually shifting panorama, the sudden view, round the shoulder of Salamis, of the Acropolis of Athens with Hymettus rising up behind it. Yet this constantly recurring thrill of setting eyes, for the first time in his life, on famous and beautiful objects that had long loomed large on his mental horizon could not distract the Englishman from giving an increasing share of his attention to his conversation with his American contemporary who was leaning over the rail at his side; for, while the young Englishman had been making himself into a classical scholar, the young American had been doing half a dozen other things which were so different from the Englishman's personal experiences up to date that they could not fail to arouse his interest. In the brief course of his working life so far, the young American had already worked on a farm, in a bank, in a bakery, in a lawyer's office, and in a grocer's store; and he had confuted the proverb about the rolling stone by accumulating incidentally enough spare money to carry him round the World (he had already travelled three times to and fro through the Mont Cenis Tunnel). Today and tomorrow he would be in Greece; the day after tomorrow he would be moving on to Egypt. In comparison with his English travelling companion, he was a babe in his knowledge of Greece and an old hand in his knowledge of Life. When, as the ship came to anchor at the Peiræus, the two 'Anglo-Saxons' discovered that their otherwise piquantly different educations had been identical in the negative point of sending them both out into the wide world unable to speak with the tongues of either men or angels,² it was the American who, in this emergency, made businesslike bargains for the pair of them with a boatman to row them ashore and with a cabman to drive them up to Athens. Two days after that, he sailed, in accordance with his schedule, for Alexandria; and, though the writer never heard from him thereafter, he never doubted that he duly arrived at a destination which, forty years on, the writer himself had not yet succeeded in reaching.

This brief encounter taught the Englishman a lesson in the cardinal

¹ See p. 38, above.

² 1 Cor. xiii. 1.

virtues of the practical life which made him appreciate one of the surviving fragments of the work of the statesman-historian Polybius.

'Plato says¹ that human affairs will never come right until "either the philosophers receive royal authority or the kings take to philosophy"; and, taking my cue from him, I should say, for my part, that the study of History will never come right until either one or other of two things happens. One of these alternatives is that the men of action (οἱ πραγματικοὶ τῶν ἀνδρῶν) should take up the writing of historical works—and take this up not just as a side-line (παρέργως), as they do now, but with so genuine a conviction that this is quite as important and quite as well worth doing [as any "practical" business] that they will be inspired with a life-long devotion to this pursuit and will refuse to allow themselves to be distracted from it. The other alternative is that would-be professional historians should take the view that history cannot be written effectively unless the writer has acquired an outlook that can be given only by actual experience of practical life. Until this happens, there will be "no hope of a cessation" of the ignorance of the present breed of historical writers.'²

¹ See Plato: *Respublica*, 473 D, quoted in III. iii. 93 and V. vi. 242.—A.J.T.

² Polybius: *Oecumenical History*, chap. xxviii, §§ 2–5. In Book XII, chap. xxv, section *h* and section *i*, . . . already made the same point *ad hominem* apropos of his predecessor Timaeus of Tauromenium:

'Timaeus confesses that he stayed for fifty years on end at Athens as a visitor who, all that time, admittedly had no experience whatsoever of military service and made no first-hand acquaintance with the topography [of the scenes of the historical events that he was recording]. So it is no wonder that, when, in his narrative, he runs up against these topics, he should display gross ignorance and should get quite a number of things wrong. Moreover, when he does occasionally approach the truth, he is like one of those painters who use lay figures for their models. They sometimes succeed in reproducing the outline of the original, but they fail to catch the verisimilitude and vitality of real live creatures—fail, in fact, to do what is precisely the professional job of an artist. Timaeus, like all other bookish historians, comes to grief in the same way. They fail to catch the verisimilitude of historical events, because nothing but personal experience (*αὐτομαθίας*) can enable the historian to achieve that. An historian who has not actually taken part himself in historical events will never succeed in effectually stimulating his readers. The historians of the classical school attached so much importance to achieving verisimilitude that, when they had to deal with politics, they would note that, as a matter of course, the writer has been a politician and has had practical experience of public affairs; when they had to deal with war, that he has seen active service and has been under fire; when they had to deal with life, that he has been a married man and has brought up a family; and similarly for all sides of life. But obviously this qualification for writing history will be found only in those historians who have mastered it by actually taking part themselves in historical events. . . . The moral is that a preoccupation with documentary materials is only one-third part of an historian's task—and this the third in order of importance.'

A NOTE ON CHRONOLOGY

(I) THE PROBLEM

IN the present work the first approach to the histories of the civilizations has been to make a comparative study of them as so many representatives of one species of Human Society, and this comparative treatment postulates that all representatives of the species are in some sense 'philosophically contemporary' with one another,¹ however far apart their locations may be on a chronological chart. In Parts II-V inclusive, which occupy the whole of volumes i-vi except for an introductory Part I, the chronological relation between one civilization and another has therefore not been a question of crucial importance; for a more or less correct knowledge of the internal chronology of each civilization is all that is required for attempting a comparative study of the geneses, growths, breakdowns, and disintegrations of the civilizations known to have existed up to date.

In the present concluding batch of volumes, however, the writer has been confronted with the task of trying to bring the respective internal chronologies of all the known civilizations into relation with one another by entering them all on a single Time-chart in so far as the historical evidence accessible in A.D. 1952 has allowed of this; for these volumes vii-x, containing Parts VI-XIII, are concerned in Parts VI-VIII with the relation of 'apparentation' and 'affiliation' between an antecedent and a posterior civilization, and in Parts IX-X with encounters between contemporaries in the Space-dimension and between non-contemporaries in the Time-dimension. Moreover, the inquiry into universal churches in Part VII has raised the question of the relation of these religious institutions to the civilizations that have preceded them and have followed them, and this has led to an analysis of the species of Society that we have called 'civilizations' into sub-varieties, representing different generations, which are distinguished from one another by differences in their historical relations to the higher religions.² It is evident that for these purposes we need to know how the several internal chronologies of our twenty-one civilizations (or whatever the number may be) stand to one another; and, as soon as we try to work out a single consolidated Time-chart, we find that the means at our disposal differ sharply in the degree of their adequacy or inadequacy in two different sets of cases.

For a student of the histories of civilizations who was working in the Western World in the twentieth century of the Christian Era, it was comparatively easy to correlate the Western Civilization's chronology with the chronologies of its living contemporaries (the Near Eastern Orthodox Christian, Russian Orthodox Christian, Iranic Muslim, Arabic Muslim, Hindu, Chinese Far Eastern, and Japanese Far Eastern societies) and also with the chronologies of antecedent civilizations (the

¹ See I. i. 172-4.

² See VII. vii. 421-3.

Hellenic, Syriac, Indic, and Sinic) to which one or more of the living civilizations were affiliated. But the evidence in the twentieth-century Western historian's possession did not enable him to reconstruct with any degree of certainty the chronology of the earliest chapters in the histories even of those four civilizations belonging to a generation immediately preceding that of his own society and its living contemporaries; and the uncertainty was greater still in the cases of other civilizations—some belonging to the same immediately preceding generation and others to an earlier generation again—of whose history no continuous tradition has been preserved by any of the civilizations that were still alive in the twentieth century of the Christian Era.

These once forgotten civilizations had been buried mentally in oblivion, besides being buried physically underground, for some thousands of years before they had been disinterred by the Modern Western archaeologist's spade. Manifestly the difficulty of correlating their chronology with that of the living civilizations and the immediate predecessors of these was vastly greater than the difficulty of consolidating the chronology of these still living and these never yet forgotten civilizations; and it was almost as difficult to translate into years of the Christian Era the chronology of the pre-Columbian civilizations of the Americas which had been contemporaries of the Western Civilization of the Old World but had been overwhelmed and submerged by its impact after having been unknown to it before it fell upon them with this instantaneously destructive effect.

The translation into years of the Christian Era of the chronologies of the pre-Columbian civilizations of the New World and the disinterred civilizations of the Old World was a task which a student of History was bound to attempt, because he could not afford to ignore the invaluable new light that Archaeology had thrown on History within the Western field of vision by bringing these formerly unknown civilizations to the Modern Western historian's knowledge. Yet, in attempting to co-ordinate Archaeology's finds with his traditional store of historical information by locating the disinterred civilizations' chronologies on his own Western Time-chart, the Western historian was manifestly committing himself to a hazardous undertaking; and the hazard was more evident when the present writer started work again on this Study, after a seven-years-long interruption caused by the Second World War, than it had been during the years A.D. 1927-39, within which he had planned the whole book, written the first five Parts of it, and published these in the first six volumes.

During the years A.D. 1927-39 the present writer was well aware that the relation of the Mayan and the affiliated Yucatec Civilization's chronology to that of the Western Civilization was the subject of a still unsettled controversy among the experts,¹ but at that time he mistakenly believed that the chronologies of the disinterred civilizations of North-East Africa and South-West Asia—the Egyptian, Minoan, and Sumeric civilizations and the Indus Culture in the first generation, and the Sumeric Civilization's Babylonian and Hittite successors in the

¹ See I. i. 124-5.

second generation—had been definitively correlated, more or less accurately, both with one another and with the chronology of the Western Civilization, in a Time-chart that had been worked out by Eduard Meyer. He felt no hesitation during those years in adopting the conclusions of this great authority, and indeed in A.D. 1952 these conclusions still appeared in retrospect to have been warrantable in the light of all the evidence forthcoming at the time.

Between A.D. 1939 and A.D. 1946, however, Meyer's conclusions had been thrown into the melting-pot as a result of the digestion, analysis, and discussion of fresh evidence that had been discovered in the nineteen-thirties. The writer returned to a study of History in A.D. 1946 to find that in Sumeric, Babylonian, and Hittite history the old chronological landmarks had been swept away and that no new landmarks had yet secured any general acceptance. The experts all agreed that the new evidence convicted Eduard Meyer's chronology of being too high; but here their consensus ended. There were now in the arena at least four rival new chronologies for South-West Asian history; and, while the most conservative of these reduced Meyer's dating of the First Dynasty of Babylon by only about one hundred years—from 2049-1750 B.C. to 1950-1651 B.C.—the most radical of the four reduced it, by nearly 250 years, to 1806-1507 B.C.

Meanwhile, in compensation, the former disagreement over Mayan and Yucatec chronology appeared to have been resolved by a victory of the lower over the higher of the two main former rival correlations of the internal chronology of the Mayan and Yucatec civilizations with years of the Christian Era.

(II) THE CASE FOR THE GOODMAN-MARTINEZ-THOMPSON CORRELATION OF THE YUCATEC AND MAYAN CHRONOLOGY WITH YEARS OF THE CHRISTIAN ERA

In the first five Parts and six volumes of this Study the present writer set out C. P. Bowdich's and H. J. Spinden's higher correlation and S. G. Morley's and J. E. S. Thompson's lower correlation side by side, without venturing to offer his readers any lead of his own towards making a choice.¹ Considering the blackness of his own ignorance of the subject, this suspension of judgement was the only attitude that he could have adopted without being guilty of intellectual impudence, though this agnosticism had the serious disadvantage of leaving the chronology in the air, since there was a discrepancy of some 260-70 years between the two systems.² Even an amateur, however, could see that Spinden's chronology for the Mayan, Yucatec, and Mexic civilizations had one ominous weakness in common with Meyer's chronology for the Sumeric, Babylonian, and Hittite civilizations. It required

¹ See, for example, I. i. 124-5.

² See the British Museum *Guide to the Maudslay Collection of Maya Sculptures* (London 1923, British Museum), p. 48, and Gann, T., and Thompson, J. E. S.: *The History of the Maya* (London 1931, Scribner), preface.

the assumption that, in the reconstructed record, there was a chronological gap in which History was a blank not occupied by any disinterred archaeological remains. This hypothetical interregnum in the archaeological record, which was about 150–200 years long in Eduard Meyer's chronology of South-West Asian history,¹ was about 350 years long in Spinden's chronology of Central American history;² yet in both cases the archaeological evidence, taken on its own merits, pointed, not to an interregnum, but to continuity;³ and for this reason, among others, 'opinion has turned against it [the Spinden correlation] . . . in recent years'.⁴ J. E. S. Thompson advocates as 'the most acceptable' correlation, without claiming that the evidence in its favour is irrefutable, the Goodman-Martinez-Thompson correlation⁵—a refinement on Morley's correlation which was adopted by Morley himself.⁶

On the authority of Morley, Thompson, and other Mayan scholars associated with the Carnegie Institution of Washington, the conversion of Mayan years into Gregorian years of the Christian Era according to the Goodman-Martinez-Thompson correlation has been adopted in Parts VI–XIII of the present Study. Yet in A.D. 1952 the experience of the revolution in South-West Asian chronology between A.D. 1939 and A.D. 1946 gave warning that the further progress of archaeological discovery might lay Morley's and Thompson's apparently definitive chronological system in ruins, as it had already laid Eduard Meyer's. One inescapable weakness of any attempt to correlate the Mayan Time-count with years of the Christian Era in the existing state of Western knowledge of the Mayan calendrical system was that, before the Maya collided with the Spaniards, they had substituted a relatively imperfect 'Short Count', in which 'accuracy within a period of only 256 years could be achieved',⁷ for a previously current 'Long Count' which 'was exact to the day over a period of 374,440 years'.⁸ 'Thus the problem of correlating the Mayan "Long Count" with Christian chronology consists of two different operations: first of correlating the Gregorian calendar with the Maya "Short Count", and second of correlating the Maya "Short Count" with the Maya "Long Count"'.⁹ Disagreement over the method of performing this second operation had been one cause of the difference between the rival Western computations of Mayan

chronology in Western terms; and, while the Goodman-Martinez-Thompson correlation might be confirmed by further discoveries in the calendrical province of Mayan studies, it might also be overthrown in its turn. Subject to this warning, it nevertheless seemed to be the best correlation to adopt in the circumstances of the time at which Parts VI–XIII of the present Study were being written and published.

(III) THE CURRENT CONTROVERSY OVER THE DATING OF THE FIRST DYNASTY OF BABYLON IN TERMS OF YEARS B.C.

The Overthrow of Eduard Meyer's Reconstruction of the Chronology of South-West Asian History.

In A.D. 1952 the correlation of Mayan with Western chronology in terms of the Goodman-Martinez-Thompson formula appeared at least to be better assured—pending some subversive fresh archaeological discovery in the Middle American field—than any of the four or more rival systems that, in the arena of South-West Asian chronological studies, were at this date in competition with one another for replacing a system, worked out by Eduard Meyer, which the progress of archaeological discovery had already discredited.

It was true that the internal chronology of the First Dynasty of Babylon had not been impugned. This dynasty was still believed to have been on the throne during eleven consecutive reigns whose severally recorded individual lengths added up to an aggregate period of 300 years ending in the overthrow of the eleventh king Samsu-ditana in a raid made on Babylon by the Hittite war-lord Muršiliš I. But there were now four or more rival substitutes for Eduard Meyer's correlation—adopted in Parts I–V of the present Study¹—of these 300 years with the years 2049–1750 B.C.; and, even if one of these competing correlations, or some other again, differing from each and all of them, were eventually to be proved correct, it was now pointed out that 'the earlier dynasties' could 'not be dated exactly from the king-list because the period by which the reigns of Ishbi-Irra [the first king of the Dynasty of Isin] and Ibi-Sin [Ibbi-Sin, the last king of the Third Dynasty of Ur] overlapped' could 'not be fixed, and' because 'the same doubt' applied 'to the reigns of Ur-Nammu [previously transliterated as Ur-Engur, the first king of the Third Dynasty of Ur] and Utu-khegal [of Erech, Ur-Nammu's fore-runner]'.² In A.D. 1952 there was, indeed, no consensus among scholars regarding the correlation of any date in South-West Asian history earlier than about 1450 B.C.³ Nevertheless, the still inconclusive controversy over the dating of the First Dynasty of Babylon was evidently the potential key to a possibility of eventually reacquiring something like the approximate certainty that Eduard Meyer had believed himself to have attained; for the highest and lowest of the current rival datings

¹ e.g., in I. i. 106, 110, and 111, and in V. vi. 296–8.

² Smith, Sidney: *Alalakh and Chronology* (London 1940, Luzac), pp. 30–31.

³ See Smith, *op. cit.*, p. 1.

of this dynasty were not much less than 150 years apart; and, by comparison with a discrepancy of this order, the chronological uncertainties arising from the overlapping of Ishbi-Irra's reign with Ibbi-Sin's, and of Ur-Nammu's with Utu-khegal's, were narrowly circumscribed.¹ Thus, if the current controversy over the dating of the First Dynasty of Babylon could be settled, this would also settle, within narrow limits, the dates of previous chapters of South-West Asian history at least as far back as the days of Lugal-zaggisi of Erech and his victim Uru-kagina of Lagash, who had reigned some five or six hundred years before the First Dynasty of Babylon had been founded.²

In A.D. 1952 the rival datings of the First Dynasty of Babylon stood as follows in terms of years B.C.³:

Modern Western Advocates	Period of the First Babylonian Dynasty	Reign of Hammurabi
(a) Sidersky; Thureau-Dangin; ⁴ Goetze	1950-1651	1848-1806
(b) Ungnad; Sidney Smith ⁵	1894-1595	1792-1750
(c) Albright; ⁶ Cornelius; Van der Waerden	1831/30-circa 1531/30 ⁷	1728-1686 ⁸
(d) Poebel; Böhl; ⁹ Dossin; Schubert	1806-1507	1704-1662

¹ 'There is new evidence to show that the margin of error for the overlap Ibbi-Sin/Ishbi-Irra does not amount to more than a year or two. See A. Falkenstein in *Z.A.*, xv (1949), pp. 59 ff., especially p. 76. Ishbi-Irra conquered Isin in about the twelfth year of Ibbi-Sin.'—Note by Mr. M. B. Rowton. ² See I. i. 109.

³ This table has been taken from a paper read by Professor A. Goetze before the American Oriental Society at its meeting in Cincinnati at Easter time, 1950, which the author has kindly allowed the present writer to cite. See also Professor Goetze's paper on 'The Problem of Chronology and Early Hittite History' in *The Bulletin of the American Schools of Oriental Research*, No. 122, April 1951, pp. 18-25, especially pp. 19-20.

⁴ See Thureau-Dangin, F.: 'Iasmah-Adad', in *Revue d'Archéologie*, vol. xxxiv (1937), pp. 135-9.

⁵ See Smith, S.: *Alalakh and Chronology* (London 1940, Luzac); 'Middle Minoan I-II and Babylonian Chronology', in the *American Journal of Archaeology*, vol. xlix, No. 1 (Concord, N. H. 1945, Rumford Press), pp. 1-24.

⁶ See Albright, W. F.: 'A Third Revision of the Early Chronology of Western Asia', in *B.A.S.O.R.*, No. 88, December 1942, pp. 28-32, superseding a previous paper on the subject by the same scholar *ibid.*: 'New Light on the History of Western Asia in the Second Millennium B.C.', in No. 77, February 1940, pp. 20-32, and No. 78, April 1940, pp. 23-33. In this earlier paper Albright had adopted dating (b), but the subsequent publication of Poebel's papers on the Assyrian King-List, discovered in A.D. 1932-3 at Khorsabad, led Albright to lower his dating for the First Dynasty of Babylon by 64 years—this precise figure for the amount of the reduction being determined by the astronomical exigencies of the tenth king Ammi-saduga's Venus observations (see 'New Light', pp. 30-31). The position reached by Albright in his third revision (i.e. Dating (c)) is maintained by him in a review of Sidney Smith's *Alalakh and Chronology* in *A.J.A.*, vol. xlvii, 1943, pp. 491-2, and in a paper on 'An Indirect Synchronism between Egypt and Mesopotamia circa 1730 B.C.' in *B.A.S.O.R.*, No. 99, October 1945, pp. 9-18. On p. 10 of this paper Albright records that, in lowering his own original reduction of Eduard Meyer's chronology by another 64 years, he was 'combining the evidence of the Venus observations with the data of the Khorsabad List', and he goes on to express the opinion that 'this latest reduced chronology fits the archaeological and historical picture so exactly that it cannot be appreciably wrong, so far as I can see.'

⁷ In *B.A.S.O.R.*, No. 88, December 1942, p. 31, Albright had dated the First Babylonian Dynasty 1831/30-1550 (*sic*, not 1530) B.C., but this is, no doubt, merely a misprint, since in *A.J.A.*, vol. xlvii (1943), p. 492, he restores to this dynasty its well-established total span of approximately 300 years by placing its terminal date *circa* 1530 B.C.

⁸ According to Albright in *B.A.S.O.R.* No. 88, December 1942, pp. 30-31. In *A.J.A.*, vol. xlvii, 1943, p. 492, he makes Hammurabi reign for an additional ten years down to 1676 B.C. This is, no doubt, merely a misprint.

⁹ See Böhl, F. M. Th.: 'King Hammurabi of Babylon in the Setting of his Time

When the experts were in such signal disagreement with one another, it would manifestly have been impertinent in a layman to presume to put forward any opinion of his own; but the layman could at least examine, for himself, the new pieces of archaeological evidence on which all four rival datings alike were based; and he could also take note of certain at least relatively well-ascertained points in Assyrian and Egyptiac chronology and in Hittite history with which any revised version of South-West Asian chronology would have to reckon.

There were three new discoveries that were accountable, between them, for the overthrow of Eduard Meyer's reconstruction of the chronology of South-West Asian history.

The Stratigraphical Evidence from Sites in North Syria.

The first discovery was that, on sites in North Syria, especially at Ugarit (Rās ash-Shamrah) on the coast and at Alalakh ('Atshānah) on the River Orontes, which, in the second millennium B.C., were subject to cultural radiation from both the Sumeric and the Egyptiac World, objects of Sumeric provenance or style attributable to the time of the First Dynasty of Babylon were found to lie in later strata than objects of Egyptiac provenance or style attributable to the reigns of the Egyptiac Emperors of the Twelfth Dynasty down to Amenemhat III inclusive.

'A Ras Shamra les cylindres babyloniens gravés d'inscriptions du temps de la première dynastie et dont certains ont pu être attribués au temps d'Hammourabi se trouvent dans les strates où dans les tombes de l'Ugarit Moyen 2, et non dans celles de l'Ugarit Moyen 1 (2100-1900), sauf remaniements. Ils y sont donc attribuables avec certitude à la période entre 1900 et 1750 en chiffres ronds. Dans plusieurs cas nous avons pu établir que les strates qui contiennent les cylindres en question sont postérieures aux monuments égyptiens commençant à Ugarit avec ceux de Sésostris I et se terminant avec ceux d'Aménemhat III; cela restreint encore davantage la date de certains des cylindres babyloniens provenant d'Ugarit et permet de les placer entre 1800 et 1700 environ.

'Ainsi, les monuments et les observations stratigraphiques et chronologiques de Ras Shamra s'accordent fort bien avec les dates proposées par Mr. Sidney Smith . . ., d'après lesquelles la première dynastie babylonienne ne venait au pouvoir que vers 1900 en chiffres ronds et s'écroulait vers 1600.¹ D'après la même chronologie, le règne d'Hammourabi s'étend de 1792 à 1750, c'est à dire qu'il est contemporain de la fin de la période correspondant à la prépondérance politique dont l'Égypte du Moyen Empire avait joui en Syrie et en Palestine.'²

This stratigraphical evidence from North Syria was of some importance

(about 1700 B.C.), in *Mededeelingen der Koninklijke Nederlandsche Akademie van Wetenschappen, Afd. Letterkunde*, Nieuwe Reeks, Deel 9, No. 10 (Amsterdam 1946, Noord-Hollandsche Uitgevers), pp. 341-70, especially p. 352.

¹ 'Les dates exactes proposées par Mr. S. Smith sont 1894 pour le commencement, 1505 pour la fin de la dynastie.'

² Schaeffer, C. F. A.: *Stratigraphie Comparée et Chronologie de l'Asie Occidentale (iii^e et ii^e millénaires)* (London 1948, Oxford University Press), pp. 29-30. Cp. Sidney Smith, *Alalakh and Chronology* (London 1940, Luzac), p. 15, where Smith quotes Schaeffer's more tentative statement of the same point in *Ugaritica*, i. 18, n. 2. Cp. Albright, 'New Light', in *B.A.S.O.R.*, No. 77, p. 29, and Neugebauer, O.: 'The Chronology of the Hammurabi Age', in the *Journal of the American Oriental Society*, vol. Ixi (New Haven 1941, Yale University Press), p. 58.

in the history of the current 'Battle of the Dates', inasmuch as it had been one of the earliest of the new pieces of information that had cast doubt on the tenability of Eduard Meyer's previously acceptable chronology. Such evidence, however, suffered from the inherent weakness of being inevitably imprecise; and it was significant that the argument in favour of Dating (b), which had been founded upon it by Schaeffer and Smith, was contested both by M. B. Rowton, who was an advocate of Dating (c), and by Professor Albrecht Goetze, who was an advocate of Dating (a). Mr. Rowton comments:

'Little can be made of the seals found at Ras ash-Shamrah or elsewhere in the Aegean area.¹ It might be added that an exact dating of seals of the "Old Babylonian" period has yet to be established. That term is often applied rather loosely to all Mesopotamian seals between the end of Ur III and the Kassite period, a total of over 400 years. A seal that belongs to the beginning of that period can, of course, be clearly distinguished from one that belongs to the end of it. But the grading of those seals (the majority) which do not belong to either of these extremes has not yet been done (probably for lack of reliable chronological evidence). Consequently, as matters stand, it is hardly possible to say whether a seal of this period is to be dated, say, 50 years before or 50 years after the middle of Hammurabi's reign.'²

Professor Goetze, for his part, was of the opinion that, 'where an independent check is possible, the evidence, as far as published, does not bear out Schaeffer's claims';³ and he expressed⁴ the same doubts as those entertained by Mr. Rowton in regard to Dr. Schaeffer's datings and attributions of cylinder seals disinterred from North Syrian sites. Professor Goetze also challenged Dr. Sidney Smith's arguments,⁵ on archaeological grounds, for dating the strata Alalakh VI and VII *circa* 1800-1600 and hence for adopting Dating (b) for the First Dynasty of Babylon. It seemed evident that the stratigraphical evidence from North Syria, though it might suffice for impugning Eduard Meyer's chronology, did not suffice for providing a criterion for judging between the relative merits of the rival new datings.⁶

The Evidence of the Mari Archives

A second revolutionary discovery was the disinterment, in A.D. 1935-8, of the archives of Zimri-Lim, King of Mari (Ma'er) on the Middle Euphrates. Twenty thousand documents—15,000 of them economic, but the other 5,000 political—were retrieved.⁷ The political documents

⁶ The utility of the archaeological evidence bearing on the period of South-West Asian history under consideration in the present Note on Chronology is appraised as follows by Dr. Sidney Smith in a letter of the 13th October, 1951, to the writer of this Study: 'Archaeological evidence is chronologically important only in establishing sequences. . . . Nothing about lengths of time is proved [by archaeological evidence] in Palestine. In Syria sometimes archaeological material is associated in different levels with dated documents—a very different state of affairs.'

⁷ See Dossin, G., in *Syria*, vols. xix (1938), pp. 105-26, and xx (1939), pp. 97-113, and W. von Soden's résumé in *Die Welt des Orients*, Heft 3 (1948), pp. 187-204.

in this trove straddle a period of at least sixty-two years all told, including the last nine years of the reign of Zimri-Lim's father Yakhdun-Lim, twenty-one years of Assyrian domination, exercised by the King of Assyria Šamši-Adad I, and the thirty-two years of Zimri-Lim's own reign, ending in the year of the destruction of Mari by Hammurabi of Babylon,¹ which is known, from Hammurabi's records, to have occurred in the thirty-fifth year of Hammurabi's reign.² The historical and chronological implications of these Mari Archives, and of contemporary documents from other places in the South-West Asian World of the day, can be appreciated better if we postpone our consideration of them till after we have dealt with the third of our three revolutionary discoveries.

The Evidence of the Khorsabad List of Kings of Assyria

This third discovery was the disinterment at Khorsabad, in A.D. 1932-3, of a list of the Kings of Assyria which purports to record the complete consecutive series down to Asshur-Nirari V (*regnabat* 754-745 B.C.), beginning with the first king of all. This Khorsabad List also gives figures for the lengths of reigns from the reign of the thirty-third king, Ērišu I, except for eight effaced entries and eight reigns—the forty-second to the forty-seventh inclusive, and the eighty-fourth and eighty-fifth—where a figure is replaced by the formula *t[duppišu šarrūta ēpuš* ('He exercised kingship during his *t[duppu*').³

Twenty years after its discovery, this list still remained unpublished; and, at the time of writing, information about it was still to be found only in an article that had been published by Professor A. Poebel in the *Journal of Near Eastern Studies* in three instalments.⁴ Poebel's article presented the contents of the Khorsabad King-List in the form of an interpretation of them, and this method of presentation had evoked from other scholars the criticism to which it manifestly laid itself open.⁵ Yet enough was now known about the Khorsabad King-List to make it plain at least that this was a tantalizing document.

Since the reign of the latest king enumerated in it, No. 107, Asshur-Nirari V, was already known with certainty to correspond to the years 754-745 B.C., and since one of the kings for the lengths of whose reigns figures are given in the list—No. 39, Šamši-Adad I—was now known,

¹ These were the figures given by G. Dossin in *Studia Mariana* (edited by Parrot, A.: Leiden 1950, Brill), pp. 51-61, especially p. 59, as was pointed out to the present writer by Professor Goetze. Dossin's figures superseded those given by Böhl, *op. cit.*, p. 348, namely 58 years all told, including the last 8 years of Yakhdun-Lim's reign, 20 years of Assyrian domination, and a reign of 30 years for Zimri-Lim. It was possible that the total span of years would be further increased by the progress of research.

² See Böhl, *op. cit.*, pp. 348 and 354. Hammurabi's conquest of Mari in his thirty-second year, which, according to Böhl, *op. cit.*, p. 354, n. 18, was not the final settlement of accounts, is equated with the definitive conquest by Van der Meer, P.: *The Ancient Chronology of Western Asia and Egypt* (Leiden 1947, Brill), p. 21.

³ See Smith, S.: 'Middle Minoan I-II and the Chronology of the American Journal of Archaeology', vol. xlix, No. 1, p. 19, and the Date of the Journal of Near Eastern Studies, vol. xi, University of Chicago Press), pp. 184-204.

⁴ In *J.N.E.S.*, vol. i, No. 3, July 1942, pp. 247-306 and 460-91, and vol. ii, January-October 1943, pp. 56-90.

⁵ See, for example, Sidney Smith's strictures in 'Middle Minoan I-II and Babylonian Chronology', p. 18.

from the evidence in the Mari Archives, to have ruled Mari for twenty-one years between the end of Yakhdun-Lim's reign there and the beginning of the reign of Yakhdun-Lim's son Zimri-Lim, whom the evidence of the Mari Archives certified to have been a contemporary of Hammurabi's, the Khorsabad List of Assyrian Kings ought to have made it possible approximately to date Hammurabi's reign, and, with it, the whole period occupied by the First Dynasty of Babylon, in terms of years B.C. In order, however, to provide this eagerly desired information with entire certainty and exactness, the Khorsabad List would have had, from reign No. 39 onwards, to be un mutilated and undisputedly precise in its indications, and unfortunately neither of these two conditions was fulfilled. In the first place the figures for kings Nos. 61, 65, and 66 had been effaced; and, though the figure for No. 61 could be restored from a fragment of another copy of the list, the lengths of the reigns of Nos. 65 and 66 remained unknown quantities.¹ In the second place the meaning of the formula 'his period', which did duty for a figure in eight cases (Nos. 42-47 and 84-85), was in dispute. In the third place it was contended by at least one authority, Dr. Sidney Smith, that there was no warrant for taking it for granted that the years recorded in this list were, all the way back to the figure given for Šamši-Adad I's reign, Babylonian solar years calculated according to the system labelled 'Julian' in a latter-day Western World in allusion to its official adoption by the Roman Government under the dictatorship of Julius Caesar as from the beginning of the Babylonian year that eventually came to be known retrospectively as 45 B.C.

A study of Poebel's article made it evident, even to a layman, that the author had succumbed to a temptation to try to force the Khorsabad List to solve the riddle of South-West Asian chronology with complete precision and certainty in spite of all these three impediments. Poebel tacitly assumes that all the years recorded in the list are Julian years; he postulates² that the compiler of the list uses the formula 'his period' in the technical sense of meaning part of the fraction of the preceding-king's last regnal year that was still unexpired at the time of that preceding king's death or deposition; and—as a result of ingenious attempts to check the data given in the Khorsabad List by comparing them with isolated, and apparently mutually conflicting, chronological statements made by Shalmaneser I (*regnabat* 1272-1243, supposing that the solar year had already been adopted in Assyria by his time) and by Esarhaddon (*regnabat* 680-669 B.C.)—he comes to the conclusion that the lost figures for reigns Nos. 65 and 66 would also prove, if they had been preserved or recovered, to have occupied, between them, only a fragment of one single year which is already accounted for in the list. On this showing, he concludes that all the unknown quantities in the Khorsabad List, as we have it, amount, in the aggregate, to no more than zero, and that it is legitimate to use the figures of regnal years contained in the list as if they represented an unbroken series of Julian solar years.

Manifestly, in adopting this procedure, Poebel is courting a risk of

¹ See Smith, S.; 'Middle Minoan I-II and Babylonian Chronology', in *A. J. A.*, vol. xlix, no. 1, p. 18.

² In *J. N. E. S.*, vol. i, p. 296, n. 130.

unduly lowering the dating of Šamši-Adad I's reign in Assyria and Mari, and therefore, by implication, also the dating of Zimri-Lim's reign in Mari and of Hammurabi's at Babylon. Indeed, if Poebel's assumptions in regard to all the three points on which the Khorsabad List was impugned by other scholars had all proved equally vulnerable to attack, the result would have been, not only to discredit Poebel's reconstruction of Assyrian chronology on the basis of the Khorsabad List, but also to demonstrate that any reconstruction on this basis would be impracticable. As it happened, however, the point in Poebel's presentation of his case that proved to be the least convincing to his critics was the point that introduced the smallest margin of arithmetical uncertainty into a calculation based on the figures that the Khorsabad List furnished. If it had been demonstrated that the phrase *t/duppīšu* meant, when used in this king-list, 'an indeterminate period' or 'an unspecified period', then the chronology of Assyrian history from reigns Nos. 84 and 83 upwards would have remained still subject to a considerable possibility of error, while from reigns Nos. 47-42 upwards it would have remained altogether incalculable. And a further element of uncertainty would have been added if it had also been demonstrated that the solar year had not been adopted for official purposes in Assyria until the reign of Tiglath-Pileser I (*regnabat* 1114-1076 B.C.), and that, before that, the 'years' recorded in the Assyrian annals had been lunar years which might or might not have been brought into step with the solar years from time to time by rough-and-ready intercalations. On these two latter points, however, Poebel's assumptions, while they were impugned by Dr. Sidney Smith, were approved by a preponderance of expert opinion, and the only point of the three in which Poebel had an impressive majority against him was his assumption that the pair of reigns for which the figures in the Khorsabad List had been lost through an accidental defacement would have been found to have a zero value if the figures had been preserved.

Dr. Sidney Smith's scepticism in regard to the use of solar years in Assyrian official chronology before the reign of Tiglath-Pileser I did not find favour with other contemporary scholars;¹ and it was also pointed out that, if Assyrian official years before that date were in truth lunar years, the automatic effect would be, not to raise, but to lower, the dating in solar years by about three years in each century, and that a hypothetical excessive correction of this hypothetical automatic reduction by occasional intercalations was the only expedient by which the lunar-year hypothesis could be made to serve as an argument in favour of a higher dating. Moreover, there was one piece of positive evidence which indicated both that *tuppīšu* had the numerical value of zero and

¹ According to Van der Meer, P.: *The Ancient Chronology of Western Asia and Egypt* (Leiden 1947, Brill), pp. 1-2, the Assyrians and the Babylonians both alike used lunar years, and both alike adjusted these to the Julian solar year—thus, both alike, using Julian solar years in practice. The Assyrians had had an automatic method of adjustment —'the month whose beginning was the nearest to the Spring Equinox was the first month of the year'—whereas the Babylonians made the necessary intercalations by decree. The only innovation that Tiglath-Pileser I of Assyria made, according to Van der Meer, was to replace the previous Assyrian method of adjustment by the Babylonian method.

that the Assyrian official years had in truth been solar years for at least a quarter of a millennium before Tiglath-Pileser I's day. The Assyrian King Asshur-Uballit I (No. 73 in the Khorsabad List) was known, on the evidence of the Tall-al-'Amarnah Archives, to have been a contemporary of the Egyptian Emperor Ikhnaton, whose reign was known, from the Egyptian evidence, to have fallen within the second quarter of the fourteenth century B.C. (in the years 1380-1362, according to J. A. Wilson's dating)¹; and, on the basis of the figures in the Khorsabad List, Asshur-Uballit's reign would be dated 1362-1327 B.C.² if the lengths of the reigns of kings Nos. 84 and 85 (two *tuppu* reigns) were assumed to be zero and if the years in which the Khorsabad List was reckoning were assumed to be solar years. There thus seemed to be positive evidence in favour of making both these assumptions of Poebel's at least as far upwards as this point in the Khorsabad List, and no evidence against making Poebel's assumption that the years of the list were solar years right back to the reign of Šamši-Adad I.

Dr. Sidney Smith attacked Poebel's assumption that the formula *t/duppišu šarrūta ēpuš* was equivalent to zero for chronological purposes by impugning the philological contentions on which Poebel's assumption had been based by Poebel himself.³ Smith had succeeded, in Rowton's opinion,⁴ in demolishing Poebel's philological basis for the equation of *tuppišu* with zero; but Rowton, for his part, proposed an alternative philological interpretation of the phrase which, like Poebel's interpretation, would equate it with zero in its usage in the Khorsabad List. The question was whether the formula used in the Khorsabad List meant, as Sidney Smith contended,⁵ 'an indeterminate period', or whether it meant, as Rowton contended, an 'end-bit' required for bringing a measure of capacity up to its full volume or bringing a measure of time up to its full length. The answer turned on the interpretation of the meaning of the Akkadian word *tuppu* in other contexts; and on this matter no one who was not an Assyriologist, and an accomplished one, could presume to pass judgement. The issue was a crucial one for the chronological question that is the subject of the present note; for, if Smith's interpretation was right, the formula would mean that the compiler of the Khorsabad List either had not known or had not chosen to tell the length of the reign to which he was applying the formula; and, considering that the formula is applied to no less than eight reigns before we arrive (in a chronologically ascending order) at the reign of Šamši-Adad I, this would mean that Šamši-Adad I's reign was practically undatable on the basis of the Khorsabad List. On the other hand, if Rowton's interpretation was right, the formula, as used

¹ See Wilson, J. A.: *The Burden of Egypt* (Chicago 1951, University of Chicago Press), p. vii.

² Mr. M. B. Rowton, in *Irāq*, vol. viii (1946), p. 96, had calculated that Asshur-Uballit's accession year was, not 1362, but 1356 B.C.; but there were also alternative datings of Ikhnaton's reign which brought the terminal date of this down to 1352 B.C. The contemporaneity of Ikhnaton and Asshur-Uballit was attested beyond dispute by the retrieval of correspondence between them in the Tall-al-'Amarnah Archives.

³ See Smith, Sidney: 'Middle Minoan I-II and Babylonian Chronology', in *A. J. A.*, vol. xlix, No. 1, pp. 1-24.

⁴ See Rowton, M. B.: '*Tuppu* and the Date of Hammurabi', in *J. N. E. S.*, vol. x (1951), p. 201.

⁵ *Ibid.*, p. 19.

in the Khorsabad List, would mean that the reign to which it applied fell within a fraction of time between the completion of a period already assigned in the list to a previous king and the antecedent actual date of that previous king's death.¹ And, on this interpretation, a reign characterized in the list by this formula would, after all, be chronologically equivalent to zero, as Poebel had assumed.

A layman who was incompetent to assess the philological pros and cons could at least appreciate Rowton's non-technical point that the formula was unlikely to be a circumlocution for a confession of ignorance or for a refusal to supply information, considering that, in recording the names of the first thirty-two of the kings in his series, the compiler of the Khorsabad List has frankly left a blank opposite each name, without giving either a figure for the length of the reign or a formula to cloak his ignorance of it. If he has thus frankly admitted his ignorance in these thirty-two cases, is it probable that he will have attempted to cloak it in eight other cases? The inference seems to be that the formula means, in Modern Western terms, not 'an unknown quantity', which presumably would have been indicated by a blank as before, but 'zero'.²

If we were to opt for Rowton's, as against Smith's, interpretation of the formula *ṭ/duppišu šarrūti ēpuš*, as well as for the view that the compiler of the Khorsabad List was reckoning throughout in solar years, it would follow that the Khorsabad List could be used as evidence for an approximate reconstruction of Assyrian chronology as far back as King Šamši-Adad I's reign; for, on these assumptions, the only unknown quantity would be the aggregate length of the two reigns Nos. 65 and 66, for which the durations originally recorded in the list had been lost to Modern Western scholarship owing to the accident that the piece of the clay tablet on which this information had originally been inscribed had been broken away before the tablet had been disinterred. Poebel's proposal to equate these two missing figures likewise with zero was unconvincing for two distinct reasons. In the first place, it seemed, *a priori*, improbable that precisely these two entries that had been lost through a physical accident should have happened originally to have been either 'blanks' or 'zeros' and not to have been figures for numbers of years, considering that, out of the 68 intact entries on the list, from king No. 33, whose reign is the first to be dated, down to king No. 107, with whose reign the list ends, not one is marked 'blank' and only eight are marked 'zero'.³ In the second place, if, in spite of this *a priori*

¹ This interpretation of the use of the *ṭuppu* formula in the Khorsabad King-List is advocated, not only by Rowton, but also by Van der Meer, P.: *The Ancient Chronology of Western Asia and Egypt* (Leiden 1947, Brill), p. 10.

² To express "zero" in this case that the missing figure is included in the figure given for the reign, an Assyrian scribe would have had to use a phrase of some sort, for the simple reason that he did not possess a sign for "zero" (see Neugebauer, O.: *The Exact Sciences in Antiquity* (Princeton 1951, University Press), pp. 16, 20, and 29.)—Mr. M. B. Rowton, in a note for the writer of this Study.

³ Mr. M. B. Rowton comments, in a letter of the 22nd January, 1952, to the writer of this Study: 'Apart from the purely mathematical improbability of the two missing reigns being *ṭuppu* reigns (the odds against are at least 60:8), there is also the genealogical factor. If these two reigns Nos. 65 and 66 are to be counted zero, then kings Nos. 61-71 reigned a total of only 79 years in six generations on the showing of Poebel's list in *J.N.E.S.*, vol. ii (1943), pp. 86 seqq. So far as I know, there is no similar instance in World History.'

improbability, Poebel's equation of the sum of the two lost entries with zero were to be accepted, one effect, as we shall see at later points in this note,¹ would be to synchronize chapters of Sumeric history and chapters of Egyptiac history which, in the light of our historical knowledge, would seem unlikely to have been contemporary with one another in truth. On these two grounds, Albright² had made an aggregate allowance of 20 years—which he afterwards extended to 22–27 years³—for the two missing figures, while Rowton had suggested⁴ an aggregate allowance of 32 years, on the ground that 'the average for a reign in the Ancient Near East is 16 years'. Albright's original allowance would raise Poebel's dating for Šamši-Adad I's reign from 1726–1694 B.C. to 1746–1714 B.C.; Rowton's would raise it to 1758–1726 B.C.

Since Šamši-Adad is known to have exercised a 21 years' domination over Mari immediately before the reign of Zimri-Lim there, and since Zimri-Lim is known to have been overthrown by Hammurabi of Babylon in the thirty-second year of Zimri-Lim's reign and in the thirty-fifth year of Hammurabi's, it will be seen that our choice between the alternative datings for Šamši-Adad's reign on the basis of the Khorsabad List will condition our choice between the alternative datings for Hammurabi's reign and in consequence for the whole epoch of the First Dynasty of Babylon. At the same time this synchronism would not suffice, in itself, to enable us to date Hammurabi's reign in terms of years B.C. with precision, since it was vitiated by two still unknown quantities. There was the unknown numerical value of the combined length of the two Assyrian reigns Nos. 65 and 66, which was assessed at 20 or 22–27 years by Albright and at 32 years by Rowton, and there was an uncertainty—not yet cleared up by any evidence forthcoming in the Mari Archives—about the synchronization of Šamši-Adad's reign (he reigned for 33 years as King of Assyria, according to the Khorsabad List) with Zimri-Lim's reign and with Hammurabi's.

The Chronological Significance of Ammi-šaduga's Venus Observations

In view of the failure of even the combined testimony of the Khorsabad List and the Mari Archives to yield a precise dating for Hammurabi's reign in terms of years B.C., it was fortunate that the approximate dating which, between them, they did yield could be narrowed down to the choice of a particular set of years B.C. by bringing to bear a piece of independent evidence—in the shape of observations of the planet Venus, recorded by Hammurabi's fourth successor, Ammi-šaduga, on tablets reporting omens—which restricted the possible choice of datings for the reigns of the kings of the First Dynasty of Babylon to a limited number of sets of years B.C. If these Venus observations had been the only evidence forthcoming, they would have been of no avail for chronological purposes. Dr. Sidney Smith points out⁵ that 'omens . . .

¹ See pp. 194 and 204, below.

² See Albright, W. F.: 'A Third Revision', p. 30, and his review of Dr. Sidney Smith's *Alalakh and Chronology* in *A. J. A.*, vol. xlvii, p. 491.

³ In a letter of the 20th November, 1951, to the writer of this Study.

⁴ In a note for the writer of this Study.

⁵ In *A. J. A.*, vol. xlix, No. 1, p. 19.

can only fix dates if on other grounds the reign of Ammi-šaduga can be limited to a period within a year or two of a possible astronomical solution of the date of observation'; and Sidney Smith's judgement on this astronomical point is endorsed by O. Neugebauer's,¹ who points out that 'the Ammi-šaduga observations . . . are not sufficient to decide by astronomical means between . . . at least five [chronological] possibilities [for the dating of Hammurabi's reign]'.² Neugebauer concludes that, while 'Astronomy requires for Hammurabi one of the years 1856, 1848, 1792, 1736 (and perhaps a few more dates in between, if we rearrange a little the choice of dates from the Venus tablets), . . . Archaeology and king-lists alone must suffice to date both the First Babylonian and the Twelfth Egyptian dynasties'.³

On Albright's and Rowton's view of the Khorsabad List of Kings of Assyria, this list, taken together with the Mari Archives, does provide—in spite of the uncertainty arising from the loss of the figures for reigns Nos. 65 and 66 and from the lack of evidence for an exact synchronization of Šamši-Adad's reign with Zimri-Lim's and with Hammurabi's—the independent historical evidence required for making use of the astronomical evidence provided by the Venus tablets; and these two scholars' approximate datings of Šamši-Adad's reign lead them, on the evidence of the Venus tablets, to take the astronomically admissible dating 1726–1684 B.C.⁴ as the exact dating of Hammurabi's reign. Sidney Smith, who is sceptical about the possibility of extracting chronological evidence from the Khorsabad King-List but finds alternative independent evidence in the stratification of artifacts disinterred on North Syrian and Aegean sites, opts, on this basis, for the likewise astronomically admissible dating 1792–1750 B.C.,⁵ which would imply the dating 1814–1782 B.C., at the latest,⁶ for the reign of King Šamši-Adad I of Assyria according to Dossin's interpretation, in A.D. 1950, of the internal chronology of the Mari Age.

This dating for this king would imply, in turn, on an interpretation of the Khorsabad List in which *tuppīšu* is taken to mean 'zero', that the two Assyrian reigns Nos. 65 and 66, for which the figures are missing in the Khorsabad List, had lasted for 88 years in the aggregate. This is not an impossible figure for the combined length of the reigns of a father and a son. A higher figure is credibly recorded as the length of the single reign of the Egyptian Emperor Pepi II.⁷ At the same time a hypothetical figure 88 is of so different an order of magnitude from the known average figure of 32⁸ years for the average length of a couple of reigns in the Ancient Near East that, while not impossible, it does

¹ See Neugebauer, O.: 'The Chronology of the Hammurabi Age', in *J.A.O.S.*, vol. lxi, pp. 58–61.

² *Ibid.*, p. 59.

³ See p. 172, above.

⁴ *Ibid.*, p. 61.

⁵ See p. 172, above.

⁶ Dr. Sidney Smith, in a letter of the 13th October, 1951, to the writer of this Study. In *A.J.A.*, vol. xlix, No. 1. (1945), p. 23, Dr. Smith suggests the slightly lower dating 1812/1811–1780/1779 B.C. for Šamši-Adad I's reign.

⁷ Dr. Smith, in a letter of the 13th October, 1951, to the writer of this Study, suggests that 'the reign of Asshur-rabi I [king No. 65] must have been a very long one to account for short reigns before and short reigns after'. Van der Meer, in op. cit., p. 11, suggests that Asshur-rabi I's reign must have been important, considering the posthumous references to it.

⁸ See p. 180, above.

seem highly improbable. This improbable figure does not, of course, exist for Dr. Sidney Smith himself, because he does not accept the interpretation of the Khorsabad List—equating *tuppišu* with ‘zero’—from which the figure arises; and in any case the improbability of the numerical value ‘88 years’ is not a conclusive argument—any more than the improbability of Poebel’s numerical value ‘zero’ for the pair of missing figures is—in favour of Albright’s and Rowton’s dating of Hammurabi (i.e. Dating (c)), considering that the numerical value ‘88’, as well as the numerical value ‘zero’, is not impossible, however unlikely.

The Relative Certainty of the Dating of the Egyptiac ‘Middle Empire’

If neither the Babylonian King Ammi-saduga’s Venus observations nor the Khorsabad List of Kings of Assyria provided conclusive evidence for passing judgement between Datings Nos. (b) and (c) for the First Dynasty of Babylon, the next recourse would be to see whether a decision between them could be reached on the basis of the chronology of Egyptiac history in the same age. The profitableness of this quest clearly depended on the answers to two questions. Was it possible to establish synchronisms between the chronology of South-West Asian history in this age and Egyptiac chronology? And, if this should prove to be possible, would it also be enlightening? In other words, was the chronology, in terms of years B.C., of Egyptiac history less in doubt—or, at any rate, less in dispute—in the sixth decade of the twentieth century of the Christian Era than the chronology of South-West Asian history was at the same date? It may be prudent to look into this second question first, since, if the answer to it were to prove to be in the negative, the first question would then be hardly worth examining.

In the Egyptian, as in the South-West Asian, field the astronomical evidence, in and by itself, appeared to be indecisive. For example, the astronomical statements in the Kahun papyri would equally well fit rival chronologies for the Twelfth Dynasty of Egypt which differed from one another by as much as one hundred years.¹ Moreover,

‘The chronology of Egypt before the Eleventh Dynasty remains completely uncertain; Eduard Meyer’s system for the early period has collapsed, and, with it, must go all attempt to be precise till there is more evidence.’²

‘For dates of the Sixth Dynasty and all earlier periods, the margin of uncertainty has to be reckoned in centuries.’³

On the other hand, it looked in A.D. 1937 as if

‘the approximate dates of the Twelfth Dynasty and later periods in Egyptian history have been established with a degree of probability which

¹ See Neugebauer, O.: ‘The Chronology of the Hammurabi Age’, in *J.A.O.S.*, vol. lxi, pp. 60–61, and Wood, L. H.: ‘The Kahun Papyrus and the Date of the Twelfth Dynasty’, in the *Bulletin of the American Schools of Oriental Research*, No. 99, October 1945, pp. 5–9.

² Smith, S., in *A.J.A.*, vol. xlix, No. 1, p. 24.

³ Edgerton, W. F.: ‘On the Chronology of the Early Eighteenth Dynasty (Amenhotep I to Thutmose III)’, in the *American Journal of Semitic Languages and Literatures*, vol. liii, No. 3, April 1937, pp. 188–97. The sentence quoted will be found on p. 197.

comes very close to certainty, [even though] exact dates—not only months and days but exact years—must still be taken *cum grano salis*.¹

This last statement can be verified by comparing Edgerton's, Wood's, and Parker's² datings for reigns of Twelfth-Dynasty Egyptian emperors. Amenemhat (Amenemmes) I's first regnal year is placed by Edgerton³ somewhere between 1995 B.C. and 1970 B.C. and is tentatively equated by him with 1989 B.C., while it is reckoned by Wood to have begun on the 3rd January, 1991 B.C.⁴ and is equated by Parker with the year 1991 B.C. approximately.⁵ Senwosret (Sesostris) III's first regnal year is placed by Edgerton⁶ somewhere between 1882 B.C. and 1870 B.C. and is tentatively equated by him with 1876 B.C., while it is reckoned by Wood to have begun on the 6th December, 1879 B.C.,⁷ and is equated by Parker⁸ with the year 1878 B.C. approximately. A layman could have some confidence in feeling that he would not be very far astray from the correct correlation of the internal chronology of the Twelfth Dynasty of Egypt with years B.C. if he followed Albright⁹ in accepting both Wood's correlations and Edgerton's internal chronology, and in making the consequently necessary small adjustments of Edgerton's tentative table of dates in terms of years B.C., and if he then went on to follow Albright, Rowton, and Sidney Smith in taking Parker's subsequent conclusions as being virtually definitive.¹⁰ It was also reassuring to observe that these three Egyptologists, in papers published in A.D. 1942 and A.D. 1945 and in a book published in A.D. 1950, were in substantial agreement, not only with one another, but also with Eduard Meyer. Edgerton dates the total period of the Twelfth Dynasty *circa* 1989–1776 B.C.; Wood (by implication from his figures for the first years of Amenemhat (Amenemmes) I and Senwosret (Sesostris) III) *circa* 1991–1778 B.C.; Parker 1991–1786 B.C.; Meyer *circa* 2000–1788 B.C.¹¹ The conspicuously exceptional survival of Meyer's chronology¹² in this instance suggested

¹⁰ 'Parker's *The Calendars of Ancient Egypt* . . . not only far surpasses Meyer and Borchardt, but also reconstructs the chronology of the Twelfth Dynasty very solidly' (Professor Albright, in a letter of the 20th November, 1951, to the writer of this Study). 'I agree that Parker's work has settled the chronology of the Twelfth Dynasty in Egypt beyond reasonable doubt' (Mr. Rowton, in a note for the writer of this Study). 'Parker . . . has, to my mind, settled this question' [of lunar datings in Egyptian documents] (Dr. Sidney Smith, in a letter of the 13th October, 1951, to the writer of this Study). For a layman this emphatic consensus of the experts in favour of Parker's conclusions was as encouraging as it was impressive.

¹¹ See the present Study, I, i. 137 and V. vi. 192.

¹² Meyer's chronology for both the foundation of the Twelfth Dynasty and the previous political reunification of the whole Egyptian World by the prince Mentuhotep of the Eleventh Dynasty who commemorated this achievement by taking the title of 'Sam Tawi', 'the Uniter of the Two Lands', had been retained virtually unaltered by H. E. Winlock in 'The Eleventh Egyptian Dynasty' (*Journal of Near Eastern Studies*, vol. ii, No. 4, October 1943 (Chicago 1943, University of Chicago Press), pp. 249–83). In this paper, Winlock, like Meyer, equates Amenemhat I's first regnal year with 2000 B.C. (p. 283); he reckons that Mentuhotep 'Sam Tawi's' reunification of the Egyptian World

to a layman's mind in A.D. 1952 that the evidence at the disposal of the Modern Western science of Egyptology for the dating of the Twelfth Dynasty in terms of years B.C. must have been more or less adequate since as far back as the beginning of the twentieth century of the Christian Era; and in this light it did not seem over-sanguine to take Parker's dating of the Twelfth Dynasty in terms of years B.C. as a more or less assured chronological landmark, and to go on to conclude that the chronology of all the subsequent chapters of Egyptiac history was likewise fairly well established in its main outlines—whatever doubts might still remain about the location and duration of some individual reigns or about the relations of certain reigns (especially Thothmes II's, Hatshepsut's, and Thothmes III's) to one another.

The Picture Presented by the Mari Archives and by Babylonian Documents dating from the Reign of Hammurabi

We may now look at the picture of South-West Asia as this presents itself to us in the Mari Archives, in Babylonian documents produced by, or during the reign of, Hammurabi, and in such other contemporary information about this chapter of South-West Asian history as had been disinterred by the middle of the twentieth century of the Christian Era. When we have seen what this picture is, we may be able to make out how the Age of Hammurabi and its sequel, the remaining 155 years of the life of the First Dynasty of Babylon from the first regnal year of Hammurabi's immediate successor Samsu-iluna down to the year in which his last successor Samsu-ditana was overthrown by the Hittite war-lord Muršiliš I, can or cannot be made to fit in with the apparently more or less secure framework of Egyptiac chronology in and after the Age of the Twelfth Dynasty of Egypt.

The picture of South-West Asia in the Age of Hammurabi is a clear one. At the opening of this age at the date, twenty-seven years before that of Hammurabi's accession, at which the Mari Archives begin, South-West Asia is still partitioned among successor-states of a universal state—'the Empire of Sumer and Akkad', *alias* 'the Empire of the Four Quarters'—which had been founded by Ur Nammu (formerly transliterated as Ur-Engur) of Ur and had broken up after the overthrow of Ur Nammu's fourth successor, Ibši-Sin (Ibi-Sin), by Elamite rebels.¹ At the opening of the present chapter there are nine Great Powers in

was within sight of completion in 2061 B.C. (p. 266); and he dates this prince's total reign 2070–2019 B.C. (p. 261). In a later work, however, *The Rise and Fall of the Middle Kingdom in Thebes* (New York 1947, Macmillan), Winlock adopts Wood's chronology (see pp. 8–9, together with the chronological table on p. 2). In this work, Winlock dates Mentuhotep 'Sam Tawi's' accession 2061 B.C.; his reunification of the Egyptiac World 2052 B.C.; and his death 2010 B.C. Thus, in A.D. 1952, there appeared to be a consensus among Egyptologists in favour of a chronology for the Eleventh and Twelfth Dynasties of Egypt that put the initial dates nine years lower than they had been put by Eduard Meyer. The terminal date for the Twelfth Dynasty was, nevertheless, placed by R. A. Parker only two years lower than it had been placed by Eduard Meyer (i.e. was placed by Parker in 1886 B.C. instead of in 1888 B.C.), since Parker emended the Turin Papyrus's figure 213 years for the total span of the Twelfth Dynasty to the figure 223, and thus arrived at the figure 206 years for the net total span—reckoning that 17 regnal years out of the aggregate 223 were years in which two reigns were overlapping, in consequence of the Twelfth Dynasty's institution of co-regencies (see Parker, *op. cit.*, pp. 68–69).

¹ See V. vi. 297.

the South-West Asian arena—Elam, Larsa, Eshnunna (in North-Eastern Shinar), Assyria, Isin (in Central Shinar), Babylon, Mari (on the Middle Euphrates, extending north-westward as far as the valley of the River Balikh), Carchemish (on the west bank of the westward elbow of the Euphrates), and Aleppo (alias Yamkhad)¹—together with a number of lesser states for whose allegiance the Great Powers are in competition.² The Sumeric Great Powers of the day are concerned, not with any external threats to the Sumeric Society as a whole, either from a neighbouring civilization or from barbarians, but with a domestic rivalry with one another. The competition between them is intense; and the period culminates in a successful attempt to reintegrate Ur-Nammu's 'Empire of the Four Quarters' through the annihilation of all but one of the parochial Powers by a single victorious survivor which thereby attains to universal dominion.

This political reunification of the Sumeric World by force of arms, which is the work of the Amorite King Hammurabi of Babylon, is preceded by an abortive bout of aggression on a smaller scale in which the would-be empire-builders are the Amorite King Šamši-Adad I of Assyria (king No. 39 in the Khorsabad List) and his sons Išme-Dagan (No. 40) and Yasmakh-Adad.³ They manage to dominate Mari for twenty-one years (the tenth to the thirtieth year inclusive of the years covered by the Mari Archives); and, on one interpretation of one piece of evidence, Eshnunna, too, is temporarily under their rule.⁴ These Amorite war-lords' imperialism is frustrated by the reinstatement, at Mari, of the previous local dynasty in the person of King Zimri-Lim; but, after an Amorite ruler of Assyria has thus failed, an Amorite ruler of Babylon is subsequently successful in achieving wider ambitions. As early as the seventh and eighth years of his reign, King Hammurabi of Babylon has already conquered and annexed Isin;⁵ and now, after having bided his time for twenty-two years, he proceeds to establish control over most of his other rivals in a series of nine successive annual campaigns, waged from his thirtieth to his thirty-eighth year inclusive.⁶ Assyria (whose power it takes him two campaigns to bend), Larsa, Mari, and Eshnunna—in fact, all the surviving Powers in the South-West Asian arena except Aleppo (Yamkhad) in the extreme

¹ See Böhl, op. cit., pp. 346 and 353.

² See the letter, quoted by Böhl, *ibid.*, pp. 352–3, and by Sidney Smith in *Alalakh*, p. 11, addressed to King Zimri-Lim of Mari by one of his subjects. This letter enumerates five Powers besides Mari—namely Babylon, Larsa, Eshnunna, Yamkhad (i.e. Aleppo), and Qatana. It explicitly makes the two points that each of these Powers has a number of satellites and that, among the Great Powers themselves, there is a Balance of Power which fluctuates in accordance with the success or failure of each Power in a perennial competition for winning the lesser states' allegiance.

³ See Böhl, *ibid.*, p. 346. King Šamši-Adad I of Assyria was, not an Assyrian, but, like Hammurabi, an Amorite (see Dossin G.: 'Šamši-Addu I^{er}, Roi d'Assyrie', in *Académie Royale de la Belgique: Bulletin de la Classe des Lettres*, 5^e Série, tome xxxiv, p. 60).

⁴ Professor Goetze comments: 'The opinion that Eshnunna was dominated by Šamši-Adad is based on the date found on tablets from Ashjaly which say "Year in which Šamši-Adad died." The argument is invalid, since in the same region whole series of dates commemorating the deaths of potentates have come to light... One can only assume that it was a custom at this period to mention the passing of the ruler in a neighbouring state in a date formula.'

⁵ See Böhl, *ibid.*, p. 353.

⁶ See *ibid.* pp. 346 and 353–4.

North-West¹ and Elam in the extreme South-East—fall under the control of Babylon within these nine years. Hammurabi rounds off these victories over other Sumeric Powers by subjugating Gutium,² the strategically vital section of the western mountain rim of the Iranian Plateau through which, between Elam to the south of it and Assyria to the north of it, runs the road (skirting the rock of Behistan) up which a conqueror from the Tigris-Euphrates Basin pushes his way eastward on to the plateau, and down which a barbarian perched on the plateau descends westward upon the lowlands.³

The Nemesis of Hammurabi's Imperialism

For a student of History, Hammurabi's feat of getting the better of four rival Powers within nine years is reminiscent of Ts'in She Hwang-ti's feat of overthrowing six rival Powers within ten years, while Hammurabi's inordinate sacrifice of blood and treasure on the altar of the archaistic ideal of re-establishing a universal state that has long since been in abeyance is reminiscent of the costly campaigns in North-West Africa, Italy, and the Iberian Peninsula that Justinian conducted in pursuit of the objective of recovering for the Roman Empire the outlying western provinces that had been lost by this Hellenic universal state after the death of Theodosius I. In view of the nemesis which overtook both Justinian's and Ts'in She Hwang-ti's achievement within a few years of the baneful world-conqueror's death, it is not surprising to see the same nemesis overtake the same perverse *tour de force* when Hammurabi is the hero—or villain—of the piece.

In fact, Hammurabi's, like Justinian's and Ts'in She Hwang-ti's, immediate successor reaped the whirlwind.

"These conquests did not last longer than half [*sic*] a dozen years: the last four years of Hammurabi himself and the first eight years of his successor Samsu-iluna."⁴

The superficially reintegrated 'Empire of Sumer and Akkad' was disrupted from within, during Samsu-iluna's reign, by the secession of a 'Kingdom of the Sealand';⁵ and

'the date-formula for the ninth year of Samsu-iluna, "Year that the Kassite Army . . .," even in the abbreviated form which is all that is recorded, shows that a Kassite invasion, the only one mentioned in any document,⁶ took place in Samsu-iluna's eighth year.'⁷

In invading Gutium without pushing on to a natural frontier, Hammurabi of Babylon had committed the same military and political error as his predecessor Naramsin of Akkad.⁸ He had given the highland

¹ Mr. D. J. Wiseman, of the Department of Assyrian and Egyptian Antiquities in the British Museum, points out the importance of Yamkhad in the South-West Asia of this age as the Warden of 'the Fertile Crescent's' north-western marches against the barbarians from the Anatolian highlands.

⁴ Böhl, *ibid.*, p. 354. Cp. pp. 346-7.

⁵ See Smith, S.: *Alalakh*, pp. 18-19.

⁶ Professor Albrecht Goetze notes: 'A Kassite invasion is also mentioned in the formula of the fourth year of Samsu-iluna's son Abi-ešuh; see now *J.C.S.*, vol. v (1951), p. 99.'

⁷ Smith, *op. cit.*, p. 24.

⁸ See I. i. 109.

barbarians provocation without subjugating them effectively, and the sequel in both cases was a barbarian avalanche.¹ In the second millennium B.C. the Kassite barbarian highlanders reacted as the Gutaean barbarian highlanders had reacted in the third millennium. The Kassites were the beneficiaries of Hammurabi's work in Shinar, as the Lombards were of Justinian's work in Italy; and, when, after a social interregnum, the curtain rises in the fifteenth century B.C. on a nascent Babylonian World, we find the whole of Babylonia under Kassite domination.² Nor are these Kassite residuary legatees of Hammurabi's empire in its metropolitan provinces the only barbarians who have profited from the collapse precipitated by Hammurabi's excessive expenditure of a moribund Sumeric Society's remaining stock of energy. The Kassite successor-state of a momentarily restored Empire of Sumer and Akkad in Babylonia marches in the fifteenth century with a Mitannian successor-state in Mesopotamia, with its centre in the basin of the River Khabur; and, though Hammurabi's victim Assyria, unlike Hammurabi's own imperial Babylon, has succeeded in keeping herself free from direct barbarian rule, the fifteenth century finds Assyria standing at bay, almost encircled by Mitannian territory and perhaps at times compelled to acknowledge Mitanni's overlordship.³

An Egyptiac Chronological Framework for the 210 Years of South-West Asian History Running from the Earliest of the Letters in the Diplomatic Correspondence of King Šamši-Adad I of Assyria down to the Hittite War-Lord Muṣṣiliš I's Raid on Babylon

We now have to examine how the more or less well-established framework of Egyptiac chronology will accommodate a phase of South-West Asian history covering, in the aggregate, a span of about 210 years, made up of the last 12 years covered by the Mari Archives before Hammurabi's first regnal year,⁴ the 43 years of Hammurabi's reign, and the 155 years, ending in the year of Muṣṣiliš's sack of Babylon, during which the First Dynasty of Babylon lingered on after Hammurabi's death. In order to fit into our approximately established correlation of Egyptiac chronology with years B.C., any correlation of these 210 years of South-West Asian history with years B.C. has to fulfil four conditions. The initial date (i.e. the date at which Šamši-Adad I's diplomatic

¹ Mr. M. B. Rowton comments: 'The military forces capable of defending [the Lower Tigris-Euphrates Basin] against the barbarians were the national armies of the major city-states. Hammurabi destroyed as many of these as he destroyed city-states. In place of them he had only his own troops to oppose the barbarians, and unavoidably these came to be over-extended. In the conquered territories a good part of the male population would have gone into slavery, and, among the remainder, bitterness would be too great, for at least a generation, to make it feasible for the Babylonian Government to take the risk of enlisting them on any large scale in its own forces.'

² See I. i. 116.

³ See Götze (Goetze), A.: *Hethiter, Churriter und Assyrer* (Leipzig 1936, Harrassowitz), pp. 98-99 and 116-17.

⁴ The Mari Archives extend backwards in time over the twenty-seven years preceding Hammurabi's first regnal year, but the particular correspondence in these archives that has a bearing on the current state of relations between the Sumeric World and the Egyptiac World is the diplomatic correspondence of King Šamši-Adad I of Assyria, and, while this appears to extend over at least the last ten years before Hammurabi's accession, there seems to be no warrant for supposing that any of the extant documents in this series date from much farther back than that.

correspondence begins) must be later than the latest date of the Twelfth Dynasty of Egypt's effective ascendancy over Syria; the terminal date (i.e. the date of Muršiliš I's sack of Babylon) must be earlier than the earliest date of the Eighteenth Dynasty of Egypt's continuous effective ascendancy over Syria; the date of this Hittite King Muršiliš I's reign must be sufficiently earlier than the date of Muršiliš I's eventual successor Suppiluliuma's Egyptian contemporary Ikhnaton's reign to allow the necessary time for the series of known events in Hittite history between Muršiliš I's time and Suppiluliuma's; and the date of Hammurabi's death must be earlier than the date of the arrival of a Hyksos barbarian war-band at the north-eastern corner of the Nile Delta, if the Hyksos were by then already equipped with horse-drawn chariots. The grounds for postulating these conditions must be explained and justified before the conditions can be used as criteria for trying to judge between the four rival datings of the First Dynasty of Babylon that were in the arena in A.D. 1952.

The Twelfth Dynasty's Ascendancy over Syria and the Dating of Šamši-Adad I's Diplomatic Correspondence

Most scholars who had studied the Mari Archives down to A.D. 1952 seemed to have been struck by the absence in them of references to Egypt, and to have taken the view that in this case an *argumentum ex silentio* was a legitimate inference.¹ Considering that cuneiform tablets, discovered in the Balikh Valley and dating from the period of Šamši-Adad's ascendancy over Mari, testified that the domain of this principality in this chapter of its history had come as close to Syria as this,² the date at which Šamši-Adad I's diplomatic correspondence begins—and, *a fortiori*, the date at which this King of Assyria, who was master of Mari from the tenth to the thirtieth of the sixty-two years that the Archives cover, marched across Syria to the Mediterranean³—must, it might seem, have been later than the latest date at which the Twelfth Dynasty of Egypt's ascendancy over Syria had still been effective.

¹ See, for example, W. F. Albright, 'New Light', in *B.A.S.O.R.*, No. 77, pp. 27 and 31, and O. Neugebauer in *J.A.O.S.*, vol. lxi, p. 58. This negative testimony of the Mari Archives appeared to be supported by the positive evidence of Archaeology.

'Si Hammourabi avait été un contemporain des premiers pharaons de la xii^e dynastie, comment les Sésostris et Amenémhat qui avaient envoyé des cadeaux diplomatiques à Ugarit, à Qatna et même plus loin au Nord, en Asie Mineure, auraient-ils pu ignorer des centres de culture et de politique aussi importants que ceux de Babylone et de Mari? Comment expliquer aussi que ces centres, qui selon les textes de Mari avaient acheté des produits originaires de pays aussi éloignés que la Crète, soient restés dans l'ignorance de la grande culture de la vallée du Nil au temps du Moyen Empire? Enfin, comment expliquer qu'à l'occasion de l'importation des produits égéens à Mari et en Babylonie par l'intermédiaire d'Ugarit alors saturée d'influences égyptiennes, aucun monument égyptien du Moyen Empire ne soit parvenu dans ces pays, alors qu'ils y furent importés du temps du Nouvel Empire?'—Schaeffer, C.F.A.: *Stratigraphie Comparée et Chronologie de l'Asie Occidentale* (iii^e et ii^e millénaires) (London 1948, Oxford University Press), p. 29.

² This piece of information was given to the writer by Mr. M. B. Rowton on the 6th October, 1952.

³ See Smith, S.: *Alalakh*, pp. 12 and 15. 'The peak of Šamši-Adad's power, evidenced by his raid to the Mediterranean, will probably have been reached toward the end of his reign.'—Professor Albrecht Goetze, in a note enclosed with a letter of the 13th November, 1951, to the writer of this Study.

This conclusion was rejected by Professor Goetze:

"The argument that Egypt ought to be mentioned in the Mari documents [if these are contemporary with the Twelfth Dynasty] does not impress me. If the fact [that Egypt is not mentioned in them] is to be acknowledged, it simply confirms [the evidence indicating] the limitations of Egyptian power, which falls short of the expectations of many among us. I personally feel that not even Sesostris (Senwosret) III exercised political power in Syria, and that his influence on towns like Ugarit was merely diplomatic and cultural. . . . The deductions made by Sidney Smith, *Alalakh*, pp. 13 ff., from certain Egyptianizing seals are completely unconvincing. There is no evidence which would show to my satisfaction that any pharaoh of the Twelfth Dynasty ruled over Alalakh or Yamkhad/Aleppo. . . . My scepticism concerning the Twelfth Dynasty has steadily mounted.¹

Professor Goetze pointed out that Wilson² took the view that the Twelfth Dynasty of Egypt had gained its influence in Syria, not by military conquest, but by 'peaceful penetration', and that Wilson was not alone in holding that opinion.³ This account of the nature of the Twelfth Dynasty's standing in Syria was, however, contested by Professor Albright.⁴

'Goetze, as you know, places the reign of Zimri-Lim (the Mari period proper) roughly about 1850-1820 B.C. This cannot be squared with the Theban Empire of Senwosret (Sesostris) III and Amenemhat (Amenemes) III. It is true that some scholars want to depress the estimates held by many of us with respect to Egyptian power and prestige during this period, insisting that there was no real empire. They forget that (except for the Execration Texts and a few other items) our knowledge of the Theban imperial domination of Nubia comes chiefly from discoveries in Nubia and the region of the First Cataract. Similarly our knowledge of the Egyptian empire in Asia will have to come from excavations in Palestine and Syria. Very few strata of this period have actually been uncovered, but, where they have been reached, Egyptian objects invariably turn up. This is true of Gezer, Megiddo, &c., in Palestine, and also of Byblos, Qatna, and Ugarit in [Northern] Syria. As the Posener Execration Texts prove (and you mention),⁵ the northern limit of Egyptian suzerainty (however desultory the defence of this line may have been) ran approximately along the Eleutherus Valley inland, dipping south to pass through the northern border of the territory of Damascus. Even in the time of the Thirteenth Dynasty there was still some semblance of unity under the first kings and under the kings from Sebek-hotep II to Sebek-hotep IV, including especially Nefer-hotep, who was still nominal overlord of Byblos about 1740-1730 B.C.⁶ In fact there were only a few years before about 1720 B.C. in which Egypt was actually in a state of anarchy and from which no monuments are preserved. This was a flourishing period in literature,

³ 'Similar views have recently been expressed by A. Scharff in Scharff, A., and Moortgat, A.: *Ägypten und Vorderasien im Altertum* (Munich 1950, Bruckmann), pp. 106 ff., and by R. Dussaud in *L'Art Phénicien du II^e Millénaire* (Paris 1949, Geuthner), pp. 25 ff.'—Professor Goetze, *ibid*.

⁴ In a letter of the 20th November, 1951, to the writer of this Study.

⁵ See p. 191 below.—A.J.T.

⁶ See Albright, W. F.: 'An Indirect Synchronism between Egypt and Mesopotamia circa 1730 B.C.', in *B.A.S.O.R.*, No. 99 (1945), pp. 9-18.—A.J.T.

and the art of the period was not entirely negligible. Certainly Egyptian wares were still being exported (e.g., scarabs). If we follow Sidney Smith's chronology¹ and date the Mari period proper about 1790-1760 B.C., we shall find ourselves in the last decade or so of the Twelfth Dynasty and the first generation of the Thirteenth. It is incredible that Egypt should not be mentioned and that Egyptian objects should not be found in Mari during this period (when Egyptian influence was so strong at Byblos, just before and after the end of the Twelfth Dynasty). The Mari records mention Ugarit and Qatna often, Byblos and Hazor in Galilee less often, Cyprus and Crete frequently; they would simply have to mention Egypt unless this period was precisely the generation when Egyptian influence had been reduced to zero by the nomadic Semites who had seized power in the Delta and Lower Egypt generally (no monuments of the later kings of the Thirteenth Dynasty appear north of Upper Egypt).'

It will be seen that the advocates of Dating (c) and of Dating (a) differ *in toto* in their respective estimates of the degree of an Egyptiac 'Middle Empire's' visibility above the horizon of a Power bestriding the Middle Euphrates as far north-westwards as the valley of its tributary the Balikh. Whereas Goetze estimates that 'the Middle Empire's' presence in Syria might have been ignored at Mari even at the height of the Twelfth Dynasty's power, Albright estimates that it could never have been ignored till a stage in the decline and fall of the Twelfth Dynasty's epigoni which was not reached till more than a hundred years after the date of Senwosret (Sesostris) III's death. Böhl, for his part, apparently cannot satisfy himself that Egypt could have been ignored at Mari before the arrival of the Hyksos barbarian invaders of Egypt at the north-east corner of the Nile Delta;² and this seems to be one of his grounds for his dating of Hammurabi's reign as late as 1704-1662 B.C. (i.e. for his adoption of Dating (d)).

Böhl's post-Hyksos dating of the Mari Archives is a *reductio ad absurdum* if, as is argued below, there are other considerations that might indicate that the Hyksos could hardly have made their first lodgement in the Delta while Hammurabi was still alive.³ Moreover, even Dating (d) would not have the effect of making Šamši-Adad's diplomatic correspondence posterior to the establishment of the Hyksos in the Delta unless we accepted, for this event in Egyptiac history, the earliest of several alternative datings for it that range over a Time-span of more than fifty years (between *circa* 1730 and *circa* 1675 B.C.).⁴ An amateur observer of this chronological controversy might feel inclined to reject both the two extremes represented by Böhl's and Goetze's respective theses; and he would also notice that the one point on which there seemed to be some agreement among otherwise dissentient experts was a prevalent impression that the decline in 'the Middle Empire's' standing in Syria had been a gradual process. At what stage in the process had the decline reached a degree at which it would be credible that, in the diplomatic correspondence of a Power astride the

¹ i.e. Dating (b). This argument of Professor Albright's would, of course, militate, *a fortiori*, against Dating (a), which Professor Goetze advocates.—A.J.T.

² See Böhl, *op. cit.*, pp. 348 and 352.

³ See p. 198, below.

⁴ See p. 197, below

Middle Euphrates, the Egyptian factor in international affairs would make no mark? In A.D. 1952 most of the experts seemed to agree that 'the Middle Empire's' standing in Syria (whatever its precise status there may have been) was already past its zenith at least as early as the morrow of Amenemhat (Amenemmes) III's death *circa* 1797 B.C. but was still at its height down to the date of Senwosret (Sesostris) III's death *circa* 1843 B.C. The open question, on which there was as yet no consensus, was that of the political situation in Syria during the reign of Amenemhat (Amenemmes) III (*imperabat circa* 1842-1797 B.C.).

At its apogee, the ascendancy of the Egyptian Middle Empire had extended over the North Syrian principalities of Byblos on the coast, Alalakh on the Orontes, and Yamkhad between the elbows of the Orontes and the Euphrates, as was attested by the evidence of the disinterred monuments.¹ Before the end of Amenemhat (Amenemmes) III's reign, however, Byblos—and therefore presumably *a fortiori* the interior of North Syria—had become independent.² On the other hand the effective maintenance of Egyptian rule over South and Middle Syria during at least the earlier years of Amenemhat (Amenemmes) III's forty-nine-years-long reign seemed to be attested by lists of place-names and personal names inscribed on figurines, preserved at Brussels, which Albright dates in the third quarter of the nineteenth century B.C.; for the place-names here mentioned cover Western Palestine and Phoenicia as far north as the River Eleutherus (*Arabice* Nahr-al-Kabir)—i.e. farther north than Byblos—on the coast, and Northern Gilead, the Hawrān and Damascus in the interior, while in the Baqā' they extend as far north as Rās Ba'lbak, forty miles south of Homs.³ Sidney Smith concedes⁴ that 'the recession of Egyptian power was slow. The monuments at Rās ash-Shamrah imply [Egyptian] control of Ugarit in the time of Amenemhat III. There is no valid ground for believing that Egyptian weakness began till the dynastic troubles set in after his death, and Egypt's footing in Asia was not completely lost till about twenty years after the death of Nefer-hotep.' He comes to the conclusion that 'the domination of the Twelfth Dynasty of Egypt in Syria ceased some time in the reign of Amenemhat III'.⁵ Goetze, however, while admitting, in deference to the *argumentum a silentio*, that the initial date of the Mari Archives must be later than the end of the reign of Senwosret (Sesostris) III, maintains⁶ that the absence in them of any reference to the Egyptian World is compatible with a dating of them that would place their beginning as early as the beginning of Amenemhat (Amenemmes) III's reign.

In face of this disagreement among the experts, the most prudent course in A.D. 1952 for a layman was to assume provisionally that the

⁵ *Alalakh*, p. 29.

⁶ In the paper read by him before the American Oriental Society at Cincinnati at Easter time, 1950.

most probable approximate upper limit for the dating of our problematical 210 years of South-West Asian history was the mid-point of Amenemhat (Amenemmes) III's reign *circa* 1820–1819 B.C., while recognizing that, alternatively, this upper limit might be as high as 1842 B.C. or as low as 1797 B.C. This would make 1792–1750 B.C. (Dating (b)) the highest probable of the several astronomically possible datings for the reign of Hammurabi, since, on this dating, the earliest letters in Šamši-Adad's diplomatic correspondence would be dated *circa* 1804 B.C.; and 1595 B.C. would then be the date of Muršiliš I's raid on Babylon, though, as far as the Twelfth-Dynasty Egyptian evidence went, these dates might be either as high as 1842 B.C. for the beginning of Šamši-Adad's correspondence, 1830–1788 B.C. for Hammurabi's reign, and 1623 B.C. for the raid on Babylon, or as low as 1797 B.C., 1785–1743 B.C. and 1588 B.C., if we were to agree that the moment at which Egypt disappeared from view below Mari's diplomatic horizon might have been at any point in Amenemhat (Amenemmes) III's forty-six-years-long reign (*circa* 1842–1797 B.C.).

It will be seen that, even if we were to admit the feasibility of dating Šamši-Adad's correspondence at the very opening of Amenemhat III's reign, this would still rule out Dating (a), whereas we could set the date of Šamši-Adad's correspondence as late as a median point in Amenemhat III's reign without thereby ruling out Dating (b). On the other hand, if we were to hold that Šamši-Adad's correspondence, in which Egypt is ignored, could not have begun till after Amenemhat III's death, this judgement would rule out Dating (b) as well as Dating (a), as was pointed out by Rowton.¹

'The highest theoretical limit is, as you say, 1842 B.C., since Amenemhat III is attested at Ras ash-Shamrah. Goetze's chronology would place the accession of Hammurabi *circa* 1850 B.C. and the end of Egyptian domination in Syria not later than 1860 B.C. Smith's chronology yields *circa* 1805 B.C. for the latter event, and therefore comes within the limits, as you point out. But it requires the postulate that the Egyptian domination in Syria ended during the reign of the powerful Amenemhat III (cp. *Alalakh*, p. 29). There is no evidence for this, and it certainly cannot be regarded as *a priori* probable. The fact that at Ras ash-Shamrah the monuments of Amenemhat III (and others) were deliberately damaged shows that his domination there was resented and was therefore very real.'

If Dating (b), as well as Dating (a), was held, on these grounds, to be inadmissible, Dating (c), by contrast, would be compatible with the longest estimate of the duration of 'the Middle Empire's' influence in Syria; for, according to Dating (c), Šamši-Adad's correspondence would not have started before *circa* 1740 B.C., i.e. about half a century after Amenemhat III's death.

The Eighteenth Dynasty's Ascendancy over Syria and the Dating of Muršiliš I's Raid on Babylon

How early was the Eighteenth Dynasty's ascendancy over Syria effectively established? A dominion extending to the Euphrates is

¹ In a note enclosed with a letter of the 20th November, 1951, to the writer of this Study.

claimed by Thothmes (Tuthmosis) I in an inscription dated in the second year of his reign; and, since he does not expressly claim to have won this dominion for himself, it is possible that he may have inherited it from one of his predecessors. While it is held to be improbable that any permanent lodgement in Asia, any farther north than Palestine, had been made by the cautious founder of the Eighteenth Dynasty, Amosis, there is no evidence to disprove, though there is also none to prove, that the ascendancy over the whole of Syria up to the Euphrates, which Thothmes I claims to be exercising, was achieved by Amosis' immediate successor and Thothmes I's immediate predecessor Amenhotep (Amenophis) I.¹ If we take Thothmes I's claim at its face value, and if we adopt Wilson's datings of these reigns² (and his datings were among the lowest estimates current at the time of writing), we can take it as certain that Muršiliš I's raid on Babylon cannot have been later than Thothmes I's accession in 1525 B.C., and possible that it was not later than some date in the reign of Amenhotep I, who, according to Wilson, was on the throne from 1545 to 1525 B.C. Muršiliš I's sack of Babylon cannot have occurred after the establishment of a continuous effective ascendancy over the north of Syria by the Eighteenth Dynasty of Egypt, since, in this dynasty's records, there is no mention of that historic Hittite campaign and indeed no mention of Muršiliš I at all; and, considering that Muršiliš I not only sacked Babylon but claims to have overthrown the Kingdom of Aleppo,³

'it is incredible that . . . when Egypt was in nominal control of Syria as far as the Euphrates . . . the Egyptian inscriptions should fail to mention the Hittites at a time when, under Muršiliš I, the latter had conquered Syria and Western Mesopotamia.'⁴

This would mean that, if Thothmes (Tuthmosis) I did in truth exercise even a nominal control over Syria as far as the Euphrates, the lowest correlation of our 210 years of Sumeric history with years B.C. that our Eighteenth Dynasty Egyptian chronological framework would allow would be 1733-1524 B.C. (i.e. the 210 years immediately preceding Thothmes I's second regnal year according to Wilson's reckoning). It would also mean that, as far as the evidence of Egyptian history went, we should not be entirely sure of our ground unless we dated our 210 years of South-West Asian history as high as 1755-1546 B.C. (i.e. the 210 years immediately preceding the accession of Amenhotep (Amenemmes) I, according to Wilson's reckoning).

There seemed, however, to be no warrant for taking Thothmes (Tuthmosis) I's claim seriously enough to venture to use it confidently as evidence for chronological purposes. The only piece of corroborative evidence known to Western scholars in A.D. 1952 was Thothmes (Tuthmosis) III's statement, in his record of the campaign in the thirty-third year of his own reign in which he reached the westward elbow of

¹ See the discussion of this point in Drioton, E., and Vandier, J.: *L'Égypte* (Paris 1946, Presses Universitaires de France), p. 381.

⁴ Albright, W. F., in *A.J.A.*, vol. xlvii, p. 492.

the Euphrates and made a raid across the river, that he set up a stele on the west bank side by side with a stele of Thothmes I's which he found standing there. This testimony of Thothmes III's would prove that Thothmes I, or one of his lieutenants, had once penetrated thus far into Asia and had staked out a boundary for the Egyptian Empire at the 'natural frontier' provided by the course of the Euphrates where it approaches nearest to the shore of the Mediterranean. But this would be no evidence that either Thothmes I himself or any successor of his before Thothmes III had ever held this line effectively or continuously. Indeed, the systematic conquest of Syria which Thothmes III carried out by stages over a total period of twelve years, running from the twenty-second to the thirty-third year of his reign, is presumptive evidence that Syria was not under effective Egyptian control during at any rate the immediately preceding chapter of history, when the Empress Hatshepsut was in power; and, on this showing, while we need not doubt that the Euphrates had once been reached by an expeditionary force led or sent by Thothmes I, we cannot be sure that North Syria, up to the line of the Euphrates, had ever been effectively occupied or continuously held by the New Empire of Egypt at any date before the thirty-third year of the reign of Thothmes III. Since Wilson dates Thothmes III's reign 1490-1436 B.C., this means that the evidence of Egyptian history does not unequivocally preclude our dating our 210 years of South-Western Asian history as low as 1668-1458 B.C. (i.e. the 210 years immediately preceding the thirty-third year of the reign of Thothmes III).

It will be seen that the ascendancy of the Eighteenth Dynasty of Egypt over Syria fails to provide us with a decisive chronological criterion for the dating of our 210 years of South-West Asian history because the facts about this episode of Egyptian history that had been brought to light by Western scholars were, down to A.D. 1952, still so fragmentary that there was at that time a margin of no less than eighty-seven years between the earliest (1546 B.C.) and the latest (1459 B.C.) theoretically possible datings for the latest year B.C. in which Muršiliš I's raid on Babylon might fall without conflicting with Egyptian chronological data. If the Eighteenth Dynasty's ascendancy over Syria up to the Euphrates was the work of Amenhotep I at the beginning of his reign *circa* 1545 B.C., this would rule out the two Datings (*d*) and (*c*) of the four rival datings of South-West Asian history, which date Muršiliš I's raid 1507 B.C. and 1531/30 B.C. respectively, but would not be incompatible with either Dating (*b*), which dates the raid 1595 B.C., or, *a fortiori*, with Dating (*a*), which dates it 1651 B.C. If, on the other hand, the Eighteenth Dynasty's dominion in Syria had been extended up to the Euphrates only just before the second year of Thothmes I's reign *circa* 1523 B.C., this would still rule out Dating (*d*), but would now just allow of Dating (*c*), and would, indeed, provide some presumptive evidence in favour of Dating (*c*) by suggesting that there might have been a relation of cause and effect between these two closely consecutive events; for, if the date of Muršiliš I's raid did immediately precede the date of the extension of the Eighteenth Dynasty's dominion up to the

Euphrates, it would be a plausible conjecture that *post hoc* signified *propter hoc* in this case. The Hittite raid on Babylon via Aleppo would have been the event that stimulated the Imperial Government at Thebes (so we might reconstruct the story) to push its frontier forward from some point in Palestine to a 'natural frontier', along the western elbow of the Euphrates, where the Theban Power would be in a position to prevent any repetition of the Hittite Power's alarming performance.¹

Moreover, even if the Egyptian ascendancy in North Syria in Thothmes I's reign was little more than nominal, it seemed unlikely that, once the claim to it had been asserted in an official inscription and been staked out on the spot by the erection of a stele, it could have been flouted at any subsequent date in Thothmes I's reign by a Hittite raid on Aleppo without this producing reactions on the Egyptian side which would have left some trace on the disinterred Egyptiac records of the period, defective though these records were. We cannot, however, feel so confident that Muršiliš I's raid would have left a mark on the Egyptiac records if it had occurred neither during Thothmes I's reign nor before it, but after it, during the period (dated 1486-1468 B.C. by Wilson) when the Empress Hatshepsut was in power, since it seems to have been the Empress's deliberate policy to ignore Egypt's interests in Asia; and, on this account, we cannot exclude, on the strength of the Egyptiac evidence alone, without reference to other considerations, the possibility that Muršiliš I's raid did occur in Hatshepsut's time and that it was the stimulus that provoked, not Thothmes I's occupation of North Syria, but Thothmes III's.

A dating as low as this for the raid is, of course, highly improbable on other grounds. It would be lower than even Poebel's dating (the fourth and lowest of the four rival schemes), and Poebel's is the lowest that the figures in the Khorsabad List of Kings of Assyria allow of, even when all the unknown quantities in this list are given (as they are given by Poebel) the numerical value of zero. Moreover, a dating of Muršiliš I's reign in the second quarter of the fifteenth century B.C. would make nonsense of the known facts of Hittite history by reducing the interval between Muršiliš I's reign and Tutkhaliya II's to less than thirty years. Yet the theoretical possibility on the Egyptiac evidence—however improbable in the light of the other evidence—that Muršiliš I's raid may have occurred in Hatshepsut's time disqualifies the Eighteenth Dynasty's ascendancy over Syria from serving as a decisive criterion for judging between the four rival datings of South-West Asian history, since, if the date of the raid had been in truth as late as this, it would have been too late to be compatible with any of those four datings, and thus would give us no guidance for deciding between their relative merits.

The Contemporaneity of Ikhnaton's Reign with Suppiluliuma's and the Dating of Muršiliš I's Raid on Babylon

There was, however, another chronological point of reference in the chronology of the Eighteenth Dynasty of Egypt which might perhaps

¹ This point is made by Professor Albright in a letter of the 20th November, 1951, to the writer of this Study.

be made to yield some indirect evidence regarding the date of Muršiliš I's raid. Ikhnaton (*imperabat* 1380-1362 B.C. according to Wilson) was known to have been a contemporary of the Hittite war-lord Suppiluliuma; Suppiluliuma was one of the successors of Muršiliš I; and it might be possible to estimate the Time-interval between the reigns of these two Hittite Kings by making conjectural allocations of time for the known intervening events in Hittite history. This alternative approach to the dating of Muršiliš I's raid was, however, highly problematical at the time of writing, since, down to A.D. 1952, the information about this period of Hittite history that was at the disposal of Western scholars was still fragmentary, and the interpretation of what there was of it was still in dispute.

Professor Albrecht Goetze, who was the pioneer of this approach,¹ sought to pave his way by establishing an additional Hittite-Egyptiac synchronism to reinforce the synchronism between the reigns of Suppiluliuma and Ikhnaton. Goetze submitted that the reign of Suppiluliuma's great-grandfather Tutkhaliya II could not have begun earlier than *circa* 1449 B.C., since the renascence of Hittite power in Tutkhaliya II's reign made itself felt in an expansion of the Hittite empire into Syria, and it was inconceivable that this expansion could have started so long as the Egyptiac Emperor Thothmes (Tuthmosis) III was alive.² From this concordant pair of synchronisms between Hittite and Egyptiac chronology it would follow that the raid on Babylon by the Hittite King Muršiliš I must be dated early enough to allow for the transaction, between that event and the accession of Tutkhaliya II, of the intervening events of Hittite history which had been brought to light by the disinterment of the Boghazkal'eh Archives. From an examination of the evidence about these intervening events that was known to Western scholars up to date, Goetze concluded³ in A.D. 1951 that the sack of Babylon by Muršiliš I was

'separated from [the renascence of Hittite power under the predecessors of Suppiluliuma] by no less than nine reigns, of which at least two . . . were fairly long. The nine kings in question represent 5 + x, most likely seven, generations. In terms of years, this should mean a period of roughly 200 years. Since Event II is fixed at *circa* 1450 B.C., we would on this basis place Event I around 1650 B.C. Thus, of the four proposed solutions of the problem of Babylonian chronology, (c) and (d) prove impossible, (b) is unlikely, leaving (a) the one that is to be preferred.'

Professor Goetze's reconstruction of this chapter of Hittite history, and consequently also his chronological conclusions from it, were, however, rejected by the advocates of all the three rival datings, including Dr. Sidney Smith,⁴ whose dating was the next highest to Goetze's own. Albright⁵ challenged Goetze's duplication of the series of three

¹ See Goetze, A.: 'The Problem of Chronology and Early Hittite History,' in *B.A.S.O.R.*, No. 122, April 1951, pp. 18-25.

² This second point is made by Goetze *ibid.*, pp. 19 and 20. Wilson's date for Thothmes III's death was, however, not 1449 B.C. but 1436 B.C.

³ *Ibid.*, p. 23.

⁴ e.g. in a letter of the 13th October, 1951, to the writer of this Study.

⁵ In a letter of the 20th November, 1951, to the writer of this Study.

Hittite kings: Hantili, Zidanta, and Huzziya. 'There is nothing about these kings', he suggested, 'to support the view that there were two of each.' Rowton¹ attacked Goetze's chronological conclusions on the basis of statistical evidence drawn from the histories of South-West Asia and Egypt. On this basis, he contended that 1432 B.C. was a more probable date than 1449 B.C. for the accession of Tutkhaliya II; that the average span of a generation in royal families in this aeon was, at longest, 25.2 years and perhaps no longer than 23, as against Goetze's allowance of 28; and that, in a politically turbulent age, the known events of Hittite history down to the beginning of Tutkhaliya II's reign from the beginning of Muršiliš I's reign do not require an allowance of more than 120 years, as against Goetze's allowance of 200. On the reckoning that Tutkhaliya II came to the throne *circa* 1430 B.C., this would bring Muršiliš I's accession to *circa* 1550 B.C. A corollary of this Rowtonian revision of Goetze's figures would be that the evidence furnished by known facts of Hittite history would be compatible with a dating of Muršiliš I's raid at 1531/30 B.C. (the date of it according to Dating (c)), instead of constraining us to date the raid at 1651/50 B.C.—a date which, if accepted, would rule out not only Datings (d) and (c) but Dating (b) as well, and would thus leave Goetze's Dating (a) in undisputed possession of the field.

Rowton's critique of Goetze's thesis² seemed, however, to show that, while the argument from Hittite history did tell against Dating (d), it did not avail to rule out either Dating (c) or, *a fortiori*, Dating (b). In other words, Hittite history fails, like the history of the Eighteenth Dynasty of Egypt's ascendancy over Syria, to provide us with the decisive criterion that we are seeking.

The Hyksos Conquest of Egypt and the Dating of the Reign of Hammurabi

Another date in a relatively well-established Egyptiac chronology which might provide a point of reference for a relatively uncertain South-West Asian chronology was, as we have observed, the date of the arrival of Hyksos barbarian invaders at the north-eastern corner of the Nile Delta. In A.D. 1952 this event was diversely dated by Egyptologists in terms of years B.C. at dates ranging from *circa* 1730 B.C.³ through *circa* 1720–1715 B.C.,⁴ 1710 B.C.,⁵ and 1682 B.C.,⁶ to *circa* 1675 B.C.⁷ The choice

¹ In *B.A.S.O.R.*, No. 126, April 1952, pp. 20–24.

² A reply to Mr. Rowton by Professor Goetze will be found in *B.A.S.O.R.*, No. 127 (1952), pp. 21–26. See also, *ibid.*, pp. 27–30, Albright, W. F.: 'Further Observations on the Chronology of the Early Second Millennium B.C.'

⁷ Mr. M. B. Rowton, in a communication to the writer of this Study.

of dates, within this range of about fifty-five years, for the advent of the Hyksos at the Asian fringes of the Egyptian World would have a bearing on South-West Asian chronology if it were to be established that the Hyksos barbarian invaders of Egypt, like the contemporary Mitanni and Kassite barbarian invaders of Mesopotamia and of Shinar, included at least a contingent of Sanskrit-speaking warriors who were of Central Asian Nomad origin; for it would follow that this contingent, at any rate, must have reached Syria from Central Asia via Mesopotamia, and from this it would follow, in turn, that they could not have traversed Mesopotamia till after Hammurabi's death, since the Upper Tigris Basin, and therefore, *a fortiori*, the basins of the Khabur and the Balikh, had been proved to have been included in Hammurabi's dominions by the discovery, at Diyārbakr, of a monument bearing a portrait of Hammurabi carved in relief.¹ It was true that, in A.D. 1952, the effectiveness of Hammurabi's authority over the several principalities which he claimed to have subjugated was being called in question by the results of recent progress in the discovery and interpretation of contemporary documents. Yet, even when Hammurabi's own account of his achievements had been discounted in the light of this new knowledge, it would still seem hardly credible that, if a Eurasian Nomad war-band had broken through the northern frontier of Hammurabi's empire within Hammurabi's lifetime, no reference to this shattering event should have been found among Hammurabi's disinterred records.

Accordingly, if the Hyksos barbarian invaders of Egypt should prove to have included a contingent of Nomads from Central Asia, the establishment of the date of their invasion of Egypt would furnish a criterion for judging between the four rival datings of Hammurabi's reign. In A.D. 1952, however, this view of the Hyksos war-band's composition and provenance was being disputed by critics of it who maintained that in truth there was no evidence for the Hyksos having been anything but local Semitic-speaking barbarians from the immediate neighbourhood of the north-east corner of the Nile Delta, and also no evidence for the Hyksos invasion having been a sudden overwhelming cataclysm and not a gradual infiltration. If this alternative account of the Hyksos were to prove to be the right one, then manifestly there would be no criterion for South-West Asian chronology to be obtained from the date of the Hyksos invasion of Egypt, whatever this date might be, and whether it was to be equated with some single year B.C. or with a period extending, perhaps, over more than half a century; for a gradual infiltration into Egypt of local barbarians from the Sinai Peninsula, or, at the farthest, from Palestine or Transjordan, might have occurred during Hammurabi's lifetime without having made any mark on the records of his reign. It will be seen that the current controversy over the composition and provenance of the Hyksos, and over the circumstances of the establishment of their ascendancy in Egypt, governed the question whether the date of the Hyksos invasion of Egypt could or could not be used as a criterion for the dating of South-West Asian history. We must therefore look into the pros and cons of this Egyptological controversy

¹ See Böhl, *op. cit.*, p. 354.

before attempting to apply this criterion for our South-West Asian purposes; and, in then proceeding to consider how the four rival datings of South-West Asian history would respond to this test, we must never forget that the test would be a valid one only if the view that the Hyksos included a contingent of Sanskrit-speaking Central Asian Nomads were to hold its ground against the view that the Hyksos were nothing but local Semitic-speaking barbarians from the Asian borderlands of the Nile Delta.

The controversy over the composition and provenance of the Hyksos turned on three points: the language that they spoke, the weapons that they used, and the manner in which they made themselves masters of Egypt.

The belief that the Hyksos included a Sanskrit-speaking contingent was based on two considerations: first, the philologically well-attested presence of a Sanskrit-speaking contingent among the more or less contemporary Mitanni barbarian invaders of Mesopotamia and Kassite invaders of Shinar, and, second, the conjecture that this element among the Hyksos was represented by the element in the fifteenth-century population of Syria that bore the title 'mariannu', and that the word 'mariannu' was an Indo-European word signifying 'males' and thence 'warriors'.

The Mitanni and the Kassites did appear to have been composite hordes in which local transfrontier barbarians from just beyond the northern and eastern borders of Hammurabi's empire had been reinforced by contingents of Nomads from Central Asia who spoke an Indo-European language. The Kassites seem to have consisted of Gutaeans highlanders from the Zagros reinforced by Sanskrit-speaking Nomads; the Mitanni, of Hurrian highlanders from Armenia reinforced by Sanskrit-speaking Nomads. If the Hyksos should prove to have consisted of Palestinian or Sinaitic Semitic-speaking barbarians, reinforced by Sanskrit-speaking Nomads and perhaps by Hurrians as well, this would be all of a piece with the rest of the picture of the Völkerwanderung in the eighteenth and seventeenth centuries B.C.

The geographical distribution of the descendants of the Indo-European-speaking intruders from Central Asia into South-Western Asia, as we find them distributed in and after the fifteenth century B.C., accords with at least one piece of archaeological evidence¹ to suggest that a wave of Sanskrit-speaking invaders which had broken out of the Eurasian Steppe on to the Iranian Plateau had split into a left wing which had swept over Eastern Iran into the domain of the Indus Culture and a right wing which had poured westwards through the Caspian Gates into Azerbaijan and thence across Armenia into Anatolia and across Mesopotamia into Syria and eventually into Egypt—as, in the eleventh century of the Christian Era, the Turkish-speaking Nomad invaders of the 'Abbasid Caliphate divided into a left wing that descended on the Caliphate's dominions in the Indus Valley and a right wing that, from a new base of operations in Azerbaijan, invaded the dominions of the East

¹ The affinity between swords brought to Mohenjo-daro by the Sanskrit-speaking barbarian destroyers of the Indus Culture and swords of the Hyksos Age found in Palestine is pointed out by Stuart Piggott in his *Prehistoric India* (London 1950, Pelican), pp. 228-9.

Roman Empire in Anatolia in and after A.D. 1037, Syria in and after A.D. 1071, and finally Egypt in A.D. 1164-9. On this historical analogy we might also infer that, in the age of the First Dynasty of Babylon, South-West Asia played the same role as in the age of the 'Abbasid Caliphate in acting as a lodestone that drew Nomad invaders out of their distant Central Asian cattle-ranges, and that, in both ages alike, the Nomads' eventual invasions of Anatolia, Syria, and Egypt were incidental consequences of an attack that had been directed towards the Tigris-Euphrates Basin and the Indus Basin as its first objectives.¹

As against this suggestion that the Hyksos are likely to have been all of a piece with the Mitanni and the Kassites in their composition and their provenance, Albright makes the point that

'The Hyksos royal names are, after all, predominantly Canaanite or Amorite, so that the irruption of the Indo-Iranians and Hurrians [into South-Western Asia] seems largely to have spent itself before reaching the Egyptian frontiers.'²

Säve-Söderbergh³ pronounces in the same sense still more categorically. 'Most of the Hyksos names are pure Semitic, and those which cannot be thus explained are in any case hardly Hurrian.⁴ . . . Names of a Hurrian type are conspicuously absent among the Hyksos.'⁵

The inconclusiveness of this reasoning is exposed by the possibility of concluding, on the same grounds, that the irruption of the Scandinavians into Western Christendom in the Dark Ages of Western history must have spent itself before reaching Normandy, since the names borne, and the language spoken, by the Norman conquerors of Apulia, Sicily, and England were, after all, predominantly French. In this instance we happen to know for a fact that, notwithstanding this linguistic evidence, the forebears of the eleventh-century Norman masters of a province on the Channel Coast of France had come thither in the tenth century from Scandinavia. On this showing, Säve-Söderbergh's and Albright's *argumentum a silentio* might have been overridden if the progress of discovery and research had confirmed Eduard Meyer's two theses that surviving epigoni of the Hyksos were to be seen in the 'mariannu' who are found in Syria in the fifteenth century B.C., and that the word 'mariannu' is Indo-European.⁶

In the fifteenth-century B.C. the mariannu in Syria were echeloned immediately in front of the Mitanni just across the Euphrates in Mesopotamia, and the apparent survival of the name 'mariannu', a thousand years later than that, in Anatolia looks like another indication that the mariannu had been associated with the Mitanni in a Völkerwanderung which had reached Anatolia from a starting-point in Central Asia in the eighteenth or seventeenth century B.C. Mâres (whose name was still per-

¹ This point has been made in I. i. 104-9.

petuated in A.D. 1952 in the district of Georgia called Imerethia) are located by Herodotus¹ in the mountainous hinterland of the south-east corner of the Black Sea, while the Mariandyni² who were eventually enslaved by the Hellenic colonists of Heraclea Pontica, on a westerly stretch of the Anatolian shore of the Black Sea, testify by the 'hyphenated' structure of their name that at this point the mariannu had met and mingled with Thynian invaders from South-Eastern Europe, as, in the hinterland of the Mediterranean coast of Spain, Celts similarly met and mingled with Iberians to form the mixed community known as the Celtiberi. Similar evidence shows that a detachment of the Mitanni found its way into Anatolia at the heels of the mariannu, as in the seventh century B.C. the Scythians found their way into Anatolia at the heels of the Cimmerians.³ Herodotus⁴ locates a community of 'Matieni' on the right bank of the River Halys (Qyzyl Irmāq) opposite the Phrygians, and records⁵ that, in Xerxes' expeditionary force, these 'Matieni' were brigaded with the Paphlagonians and were equipped like the Paphlagonians, the Ligyes, the Mariandyni, and the Cappadocians. Hecataeus⁶ perhaps records the presence of an advance guard of these 'Matieni' on the left (i.e. west) bank of the Halys in his mention of a town named Hyopê, near Gordii, inhabited by 'Matieni' who wore Paphlagonian dress, while his 'Matieni' who are neighbours of the Moschi⁷ would be identical with Herodotus's Anatolian 'Matieni' if the Moschi in question are those who contended with the Assyrians in Lycaonia in the eighth century B.C., but would be neighbours of the Mâres, in the hinterland of the south-east corner of the Black Sea, if the Moschi associated with them are, as Hecataeus implies in this passage, the remnant of the Moschi that had survived in this secluded area.⁸

This geographical association of the name 'mariannu' with the name 'Mitanni' might commend the thesis that the mariannu, like the Mitanni, included an Indo-European-speaking element if there were also some philological warrant for this. Eduard Meyer's conjectural Indo-European etymology for the word was, however, rejected by more recent scholars. According to Dr. Sidney Smith,⁹ the 'mar-' in 'mariannu'

¹ In Book III, chap. 94, and Book VII, chap. 79.

² See Herodotus, Book I, chap. 28; Book III, chap. 90; Book VII, chap. 72.

³ Hrozný hazards the conjecture that the Midianites were the epigoni of a detachment of these Mitanni who had accompanied or anticipated a left wing of the mariannu in their invasion of Syria and had broken from there upon the highlands of North-Eastern Arabia. See Hrozný, B.: *Die Älteste Geschichte Vorderasiens und Indiens* (Prague 1943, Melantrich), pp. 134, 152, 213-14. Hrozný points out in op. cit., p. 134, that his equation of Midian with Mitanni is borne out by the presence of the Mitannians' associates the Hurrians astride the King's Highway immediately to the north of Midian, in the highlands east of the Wadi 'Arabah that were subsequently taken from these 'Horites' by the Edomites (see VI. vii. 102, n. 1). Hrozný's identification of the names 'Midian' and 'Mitanni' was, however, rejected by Goetze.

⁷ The evidence about the Anatolian Matieni is presented by F. H. Weissbach in Pauly-Wissowa: *Real-encyklopädie*, new edition, vol. xiv (Stuttgart 1930, Metzler), cols. 2203-4. On the Hellenic map of Anatolia, 'Matianê' (*Turciê Machan*) also figures as the name of a station, just to the south of the southernmost bend of the River Halys, on the road between Soandus (Nevshehir) and Sacasena (Süksün).

⁹ In a personal communication to the writer of this Study. See also *The Antiquaries' Journal*, vol. xix, p. 43.

was derived from a Sumerian word meaning wagon, while 'the -annu could be an affirmative of the Hurri language, not Indo-European'. According to Mr. D. J. Wiseman,¹ no Indo-European personal names were to be found among more than 2,100 personal names of mariannu that were known to Modern Western scholars by June 1953. Mr. Wiseman concurred with Dr. Sidney Smith in holding that 'mariannu' was a Hurrian word; and this would be what was to be expected, considering that, at Alalakh, about 90 per cent. of the personal names were Hurrian in the fifteenth century B.C., while, on the same site in the eighteenth century B.C., some of these fifteenth-century Hurrian names had already been current.² The Hurrian word 'mariannu' seems to have been, not an ethnikon, but a class-designation. There was, for example, a fifteenth-century writ, issued by Niqmepa, making Gabia a 'mariannu' in perpetuity. In North Syria in the fifteenth-century B.C. the mariannu seem to have been the highest of three classes into which the population was divided,³ and they seem also to have been distinguished by the possession of wheeled transport, considering that the entries 'has a chariot/wagon' and 'has no chariot' were placed against the names of mariannu in a disinterred list. A record of one-year-old horses being put to 'mariannu work' had also been found.⁴

This association of the mariannu with horses in the fifteenth century B.C. looks like another indication that, even if they did not share with the Mitanni an Indo-European element in their racial composition, they did share with them the mastering of a military technique that had been ascribed, by one school of Modern Western scholars, to the Hyksos as well. The Hyksos had been credited with the possession of two new-fangled weapons, the horse-drawn chariot⁵ and the composite bow,⁶ and these two new weapons had been held to have been introduced to South-West Asia suddenly by eighteenth-century or seventeenth-century Sanskrit-speaking Nomad invaders from Central Asia.⁷ This thesis, however, had latterly been contested. According to Sève-Söderbergh,⁸ for example, 'the horse was known in Mesopotamia long before we find any traces of Indo-Iranians^{9[3]} and . . . there is not the slightest evidence that the Hyksos used the horse until the very latest part of their rule in Egypt'. Among the material relics of life in Egypt during the period of the Hyksos ascendancy there, 'not even a bone of a horse'

^{9[3]} 'Cp., for example, Götze, *Kleinasien*, 72 (inter alia, a *rabi sisē* in the Cappadocian tablets from the nineteenth century); horses and chariots in Mari under Zimri-Lim (*Syria*, No. xix, p. 125); Mallowan, *Iraq*, No. ix, p. 216 ('the chariot was already widely used in the Early Dynastic-Sargonid III periods, and . . . the chariot warfare so freely practised in the middle of the second millennium B.C. was then a comparatively modern exploitation of an invention which had been made more than a thousand years earlier').

had been found in any Egyptian tomb of that age; no picture of a horse had been found; and in hunting-scenes the hunter is depicted on foot.¹ Among all the allegedly Hyksos earth-work fortresses, once supposed to be the characteristic laagers of an army of charioteers, only two had been identified in Egypt itself, and these two had turned out to be probably not fortresses but temple-foundations.² As for the Hyksos' new-fangled weapons, Sève-Söderbergh contends³ that

'it is only towards the end of their rule in Egypt that they introduce a number of improvements in military technique in an attempt to uphold their political power against the growing Egyptian opposition. Then first the horse-drawn chariots, new types of daggers and swords, bronze weapons, the strong compound Asiatic bow, &c., are imported from Asia.'

The opposing view that the Hyksos had brought these new-fangled weapons with them at their first appearance and, in virtue of them, had conquered Egypt at one stroke might seem to be supported by the late and second-hand, but sole surviving, literary record of the Hyksos conquest. Manetho, in a passage quoted from his work by Josephus in his *Contra Apionem*,⁴ writes:

'The story is an almost incredibly fantastic one. A people from the East, of obscure origin, had the audacity to march against Egypt, and they conquered it at one stroke; it was child's play for them; they met with no resistance. And then, when they had overcome the previous government of Egypt, they behaved atrociously; they burned down the cities and rased the temples to the ground, and the whole of the native population suffered cruelly at their hands: the males were massacred; the women and children were enslaved.'

In this passage, which was the sole surviving piece of literary evidence for the event, the note of unexpectedness, suddenness, surprise, and speed is unmistakable and, indeed, emphatic. But against this reading of Manetho's testimony, whatever it may be worth, Sève-Söderbergh pits archaeological evidence for the thesis that the conquest was a gradual one and that it consisted merely in the substitution of local Semitic-speaking rulers for Egyptian rulers, and not in the immigration of a horde of strange barbarians from the back of beyond. In the Eastern Delta, dynasts with Semitic names begin to make their appearance perhaps as early as 1730 B.C.⁵ The term which has been transliterated into Greek as 'Hyksos', and which means 'rulers of foreign countries', 'gives us the impression that the Hyksos were only a little group of foreign dynasts rather than a numerous people with a special civilization'.⁶ 'There are a great many tombs from the Hyksos period in Egypt, but there is nowhere a clear indication of an invasion of a foreign people from the North. . . . There is nowhere a sudden change in the burial customs',⁷ and the alleged evidence in the style of Egyptian pottery of the Hyksos Age for an immigration of a foreign people into Egypt in this period will not hold water.⁸

Thus, by A.D. 1952, the thesis that the Hyksos included a contingent of Sanskrit-speaking Central Asian Nomads had come under heavy fire; and, though, in the still inconclusive state of the controversy, this thesis could not be held to have been driven off the field as yet, it was already clear that any attempt to use it as a criterion for dating the reign of Hammurabi was subject to the possibility that it might prove a broken reed. With this reservation in our minds, we may now go on to consider how the date of the Hyksos invasion of Egypt would affect the choice between the four rival reconstructions of South-West Asian chronology if the Hyksos should, after all, turn out to have included a Central Asian contingent who could not have driven their chariots across South-Western Asia while Hammurabi was still alive.¹

If, on these grounds, we could take it as being certain that Hammurabi's death must have been earlier than the Hyksos invasion of Egypt, this would rule out Dating (*d*), which dates Hammurabi's death 1662 B.C., i.e. thirteen years later than the very latest of the divers rival datings, ranging from 1730 B.C. to 1675 B.C., for the Hyksos invasion of Egypt that were in the field in A.D. 1952.² This event in Egyptiac history cannot, however, be used as a criterion for deciding between Datings (*c*) and (*b*) for Hammurabi's reign unless we are able to come to some conclusion regarding the date of the Hyksos invasion itself; for in A.D. 1952 the current rival datings of it splayed out, as we have seen, over a span of no less than fifty-five years extending from 1730 B.C. to 1675 B.C., and, whereas the earlier of these two extreme datings would rule out not only Dating (*d*) for Hammurabi's reign but also Dating (*c*), which dates Hammurabi's death 1686 B.C., the later of the two extreme datings would be compatible with Dating (*c*), as well as with Dating (*b*). It will be seen that the acceptability of Dating (*c*) for the reign of Hammurabi was at stake in the current controversy over the dating of the Hyksos invasion of Egypt—on the assumption, of course, that a contingent of barbarians from Central Asia was included in the Hyksos war-band.

For the establishment of the date of the Hyksos invasion there were two mutually independent approaches in the light of the Egyptiac information at the disposal of Western scholars up to date. Since the dates of the Twelfth Dynasty and the date of the expulsion of the Hyksos from Egypt by Amosis were already more or less well assured, the chronology of the intervening age could be reconstructed on the basis of the Egyptiac king-lists and of the names, the regnal years, and

¹ Goetze, in a paper read before the American Oriental Society at Cincinnati at Easter 1950, maintained that an invasion of Egypt by barbarians from Central Asia could not have taken place so long as Hammurabi's successor Samsu-iluna was on the throne, since during his reign Babylon still maintained her hold on the Middle Euphrates. But might they not have ridden from east to west across the plains of Northern Mesopotamia and have crossed the Euphrates at its westward elbow, at some point to the north of Carchemish? This route would hardly have trespassed on the domain of the Babylonian Empire in the territory of the former Kingdom of Mari.

² Professor W. F. Albright comments, in a letter of the 5th January, 1952, to the writer of this Study: 'Certainly a storm broke over Mesopotamia and Syria-Palestine in the years immediately following the death of Hammurabi, and, since this storm is hard to separate from the rise of the Fifteenth Dynasty in Egypt [i.e. from the establishment of the Hyksos domination—A.J.T.], one would apparently be compelled to date the latter event as late as after 1660 B.C., which does seem highly improbable.'

the acts of individual kings that were recorded in disinterred documents. If the collapse of the Hyksos Power in Egypt was to be dated *circa* 1567 B.C., the figure of 108 years, given by the Turin Papyrus for the total duration of the Hyksos Fifteenth Dynasty,¹ would place the Hyksos invasion of Egypt at 1675 B.C., and this dating of that event would allow sufficient time both for five or six Fifteenth-Dynasty Hyksos war-lords who exercised a domination over Egypt² and for the preceding pharaohs, bracketed together in the king-lists as the Thirteenth Dynasty, who had reigned between the end of the Twelfth Dynasty, dated 1786 B.C. by Parker, and the Hyksos irruption.

This dating accorded so well with all interpretations of all the extant evidence, save for one single item, that it would hardly have been questioned if this other piece of evidence had not turned up in the shape of 'the Stele of the Year Four Hundred'.³

This monument had been discovered on the site of the Deltaic city of Tanis (*alias* Ramses), to which the capital of 'the New Empire' had been transferred from Thebes in the time of the Nineteenth Dynasty.⁴ The inscription on the stele states that it was erected by order of Ramses (Ramesses) II (*imperabat* 1301-1234 B.C. according to Wilson) to commemorate a state visit paid to Tanis by Ramses (Ramesses) II's father, Seti (Sethos) I—at some date, to judge by the styles and titles employed in this context, that was anterior to both Seti I's and his father Ramses I's accession to the Imperial Throne—for the celebration of the reign of 'Seth-the-Great-of-Strength, the Son of Re, His Beloved'. Since Seth was the local tutelary divinity of Tanis, and since the four-hundredth year of his reign was the occasion that had led to the erection of the stele, the initial year of this four-hundred-years-long span was presumably some date at which Tanis had, for some reason, become a place of importance. On the supposition that Tanis was identical with 'Avaris', the city in which the Hyksos war-lord who had been the conqueror of Egypt had established his military headquarters and his summer residence according to the passage of Manetho's work quoted by Josephus in his *Contra Apionem*,⁵ it was conjectured by Western scholars that the selection of the city by the Hyksos for this important role was the event in the history of Tanis which had been taken as the initial date of an era whose four-hundredth year had given occasion for the erection of Ramses (Ramesses) II's stele. This conjecture might appear to be supported by the representation of the god Seth on the stele in Asiatic dress, since the Hyksos were known to have identified the autochthonous Egyptiac divinity Seth with an imported tutelary divinity of their own. If it were further to be assumed that the four-

¹ Manetho gives the figure of 104/3 years for the same epoch, i.e. for the duration of his Fifteenth Dynasty. Säve-Söderbergh, in loc. cit., p. 66, prolongs the total duration of the Hyksos Rāj in the north of Egypt and in Southern Palestine by reckoning that the Hyksos rulers of the Fifteenth Dynasty were followed by 'a second group . . . which we may call the Sixteenth Dynasty'.

² Six names of Hyksos pharaohs of the Fifteenth Dynasty were recorded by Manetho; five names (four of them corresponding to four of Manetho's) had been recovered by Modern Western archaeologists (see Drioton and Vandier, op. cit., p. 285).

³ English translation in Pritchard, J. B.: *Ancient Near Eastern Texts* (Princeton 1950, University Press), pp. 252-3.

⁴ See II. ii. 112 and 114.

⁵ Book I, chaps. 75-82, partially translated on p. 203, above.

hundred-years period was to be reckoned back, not from the date of the erection of the stele, but from the date of Seti's state visit to Tanis at some date before the end of the reign of Horemheb (*imperabat circa* 1349-1319 B.C.), the cumulative result of this pile of assumptions would indicate, for the Hyksos conquest of Egypt, a date round about 1730-1720 B.C.

Unless it were assumed, as it was by Säve-Söderbergh,¹ that the Hyksos Fifteenth Dynasty had been followed by a Hyksos Sixteenth Dynasty, this interpretation of 'the Stele of the Year Four Hundred' was the sole basis for any dating of the Hyksos conquest of Egypt earlier than *circa* 1675 B.C., which, as we have seen, was the date indicated by the Turin Papyrus's figure of 108 years for the duration of the Fifteenth Dynasty.

An acceptance of even the lowest of the dates for the Hyksos conquest that could be reconciled with this interpretation of 'the Stele of the Year Four Hundred' would have the chronologically awkward effect of allowing too little time for the aggregate length of the reigns known to have occurred between the end of the Twelfth Dynasty and the beginning of the Hyksos Fifteenth Dynasty.² Some of the scholars who pinned their faith on the stele sought to meet this difficulty by assuming that the reigns of some of the pharaohs of the Thirteenth Dynasty were contemporaneous with one another, while others sought to meet it by assuming that the latest of these reigns were contemporaneous with the first stage of the Hyksos conquest of Egypt, which, on this hypothesis, was assumed to have been accomplished in successive stages.

There might be something to be said for the first of these two suggested ways out of the chronological difficulty, considering that, at least in the last stage of all before the Hyksos conquest, the Egyptian imperial government did seem to have disintegrated into a number of petty parochial principalities. The second of the suggested ways out, however, could hardly be reconciled with Manetho's story of the Hyksos conquering Egypt at one blow; and Manetho's story, fantastic though it might sound, was not incredible on the hypothesis that the Hyksos had included in their ranks a contingent of Eurasian Nomad warriors who had swooped down upon South-Western Asia armed with new-fangled weapons which were irresistible to any adversaries who had not yet mastered the use of them. These archer-charioteers would have secured the full benefit of their armament in their assault upon Egypt because they would have descended on her suddenly, from the back of beyond, and so have taken her completely by surprise. This decisive element of surprise would, however, have been a wasting asset. As soon as military contact had been established, the victims of the horse-drawn chariot and the composite bow would have been bound to learn the tricks of their conquerors' trade sooner or later. In Egypt in the sequel to the Hyksos conquest, it did, in fact, take the Thebans rather more than a century—*circa* 1675 B.C.—1567 B.C.—to become sufficiently competent charioteers to be able to drive the Hyksos back into Asia. From this actual sequel we

¹ See p. 205, n. 1, above.

² This point is made by Drioton and Vandier, in *op. cit.*, p. 283.

may infer that, if—contrary to the picture painted by Manetho—the original Hyksos conquest of Egypt had in truth been protracted over a period of about half a century, this ‘staggered’ challenge would have evoked on the Egyptian side an increasingly effective response; and indeed, if the conquest had really moved at that slow pace, it would have been unlikely ever to have been carried to completion.

On this showing, a layman might be inclined to abide by the testimony of Manetho in defiance of an interpretation of ‘the Stele of the Year Four Hundred’ which, after all, was not, and could not be, anything more than a tissue of conjectures. The inscription on the stele did not make it clear whether the four hundred years were to be reckoned back from the date of the erection of the stele by Ramses II or from the date of Seti’s state visit. If the period was to be reckoned back from the date of erection, there was no statement of the year of Ramses II’s reign in which the erection had taken place, and even the dating of Ramses II’s reign in years B.C. was uncertain.¹ If, on the other hand, the period was to be reckoned back from the date of Seti’s state visit, there was no indication of the year of Horemheb’s reign in which this visit had taken place. Finally, whatever the initial date of the four-hundred-years-long period might be, there was no evidence that the event, commemorated by it, in the history of Tanis was the selection of Tanis by a Hyksos conqueror of Egypt to be his military headquarters and his summer residence.² Indeed, it was not certain that Tanis was identical with a Hyksos *place d’armes* which Manetho, in the sole piece of historical evidence concerning it, calls, not ‘Tanis’, but ‘Avaris’.

If we were to renounce the manifestly hazardous endeavour to extract from ‘the Stele of the Year Four Hundred’ a dating for the Hyksos conquest of Egypt, a dating *circa* 1675 B.C. for this event would remain in

¹ Mr. M. B. Rowton had argued, in *The Journal of Egyptian Archaeology*, vol. xxxiv (1948), p. 72, that Ramses II’s accession year should be dated, not 1301 B.C., but 1290 B.C.

² Alternatively the event taken as the inaugural date for an Era of Tanis might have been the selection of the city to be the local seat of government for one of the parochial principalities—some under native Egyptian princelings and others perhaps under Semitic-speaking alien war-lords from a no-man’s-land beyond the eastern fringes of the Delta—into which Lower Egypt may have disintegrated during the last phase of the decline of ‘the Middle Empire’ before the Hyksos conquest. In a letter of the 20th November, 1951, to the writer of this Study, Professor Albright remarks that he would date the Hyksos Empire of the Fifteenth Dynasty about 1690–1580 B.C., 20–30 years below the initial date suggested for this by H. Stock in his *Studien zur Geschichte und Archäologie der 13. bis 17. Dynastie Ägyptens*. The Hyksos Empire, Professor Albright adds in this context, ‘was clearly preceded by an anarchic period of Semitic domination lasting about 40 years, during which the prestige of Egypt sank to zero’. Unlike a *Völkerwanderung* from Central Asia to Egypt, an infiltration of local Semitic-speaking barbarians into Egypt from the Sinai Peninsula, or even from the Syrian Desert, was, as we have observed, evidently something that might have happened during Hammurabi’s reign without having left any mark in contemporary Babylonian records.

The hypothesis that there may have been this infiltration of local Semitic-speaking barbarians into the Eastern Delta from *circa* 1730 B.C. onwards is, of course, quite compatible with the hypothesis that the Hyksos conquest of Egypt was a subsequent sudden catastrophic event, *circa* 1675 B.C., in which Nomads from Central Asia were participants. Säve-Söderbergh, who equates the Hyksos invasion with the local Semitic-speaking barbarians’ infiltration, rejects Albright’s dating of the Hyksos Fifteenth Dynasty *circa* 1690–1580 B.C., and proposes to date it *circa* 1720–1610 B.C., in order to leave time for his Hyksos Sixteenth Dynasty to follow on before the expulsion of the Hyksos by Amosis (see Säve-Söderbergh in loc. cit., p. 62, n. 4).

undisputed possession of the field; and our condition that Hammurabi's reign must have been over before the Hyksos conquest of Egypt took place would then fail to provide us with a criterion for judging between Dating (c) for Hammurabi's reign and Dating (b); for, if the Hyksos conquered Egypt *circa* 1675 B.C., Hammurabi was already dead by that date according to Dating (c) as well as Dating (b), and, indeed, this date for the Hyksos conquest fits in with Dating (c) very neatly. As Professor Albright points out,¹

'According to my chronology [i.e. Dating (c)], the powerful Hyksos rulers of the Fifteenth Dynasty, who conquered Upper Egypt about 1675 B.C., reflect to a still unknown extent the irruption of the Hurrian and Indo-Aryan hordes who flooded Mesopotamia and nearly overwhelmed Babylonia after the death of Hammurabi, in the early years of his son, Samsu-iluna.'

In fact, the first appearance of the Hyksos' Kassite cousins in history, when, in the eighth year of Samsu-iluna's reign, they made an unsuccessful assault upon Babylonia,² would date, according to Dating (c), *circa* 1678 B.C.—that is, about three years before the Hyksos' successful assault on Egypt.

The Kassite Conquest of Babylonia and the Dating of the Reign of Hammurabi

If we hold that Hammurabi's reign must have been over before the conquest of Egypt by the Hyksos, *a fortiori* we are bound to hold that it must have been over before the conquest of Babylonia by the Kassites, and the chronology of the subsequent Kassite Rāj in Babylonia therefore gives us a sixth criterion for judging between the four rival datings for this epoch of South-West Asian history.

In A.D. 1952 this criterion, like the others, was not an instrument of precision; for in A.D. 1952 it was still uncertain exactly how long the Kassites had reigned, what was the exact year in the twelfth century B.C. with which the closing year of their reign was to be equated, and from what exact stage in their progressive conquest of the Land of Shinar they retrospectively dated the official inauguration of their régime. The closing year of the Kassite Dynasty's reign had been diversely dated *circa* 1172 B.C. by Eduard Meyer and *circa* 1150 B.C. by Albright.³ On the lower of these two rival equations the official beginning of the dynasty's reign would fall *circa* 1727/1726 B.C. on the authority of 'King-List A', which assigns to the thirty-six Kassite Kings a total of 576 years and 9 months.⁴ A discrepancy between this list and one of the synchro-

³ See Smith, *Alalakh*, p. 20. The exact date was probably 1151 B.C. according to M. B. Rowton, in *Iraq*, vol. viii, p. 97; 1157-1155 B.C. according to Dr. Sidney Smith in a letter of the 13th October, 1951, to the writer of this Study; 1158 B.C. according to van der Meer, *op. cit.*, p. 16; 1162 B.C. according to Cavaignac, E., in *Revue d'Assyriologie*, vol. xl (1945-6), p. 20.

⁴ On Rowton's reckoning that, in the Ancient Near East, 16 years was the average length of a reign, a total of 576 years for the Kassite Rāj would exactly conform to the general average, supposing that none of the 36 reigns assigned to this epoch of 576 years

nous lists disinterred at Asshur indicated, however, that some of the reigns reckoned as successive in 'List A' might in truth have been at least partly contemporary with one another;¹ and this would mean that the date of the official inauguration of the dynasty might be appreciably lower than 1727/1726 B.C., even if the average length of all the thirty-six Kassite reigns was, not twelve years, but sixteen, while it could not be higher than 1749 B.C., even if, as now seemed improbable, 'King-List A' were correct and if, besides this, Eduard Meyer were, after all, not in error in dating its terminal year as early as 1172 B.C.

It will be seen that what was known in A.D. 1952 about the chronology of the Kassite Dynasty was almost certainly compatible with Dating (b), since the highest possible date for the inauguration of the Kassite Rāj was 1749 B.C., and, according to Dating (b), this was just later than the date of Hammurabi's death in 1750 B.C. and was only seven years earlier than the eighth year of Samsu-iluna's reign—reckoned as the year 1743 B.C. according to Dating (b)—in which the Kassites make their first recorded appearance. The probability that some of the Kassite reigns were contemporaneous and the possibility that the terminal date of the Kassite Rāj may have been *circa* 1151/1150 B.C., not *circa* 1172 B.C., make it highly probable that the inaugural date of the Kassite Rāj was later than 1743 B.C., even if the total duration of the Rāj was 576 years, as 'King-List A' states. At the same time, this Kassite criterion does not conclusively rule out Dating (c); for, as we have seen, the figure of 576 years for the total duration of the Rāj seems to be impugned by the figure for the average length of an individual reign that results from taking an average of the nineteen reigns of known lengths; and it is also significant that Dr. Sidney Smith, whose chronology (Dating (b)) would admit of a conquest by the Kassites of the whole of Babylonia up to the walls of Babylon itself at one blow at any time after 1743 B.C.—which, on this dating, was the date of the eighth year of Samsu-iluna's reign—marshals² an imposing array of evidence pointing to the probability that the Kassites made themselves masters of Babylonia by a gradual process of successive encroachments, beginning in Samsu-iluna's eighth year, which was not completed till the city of Babylon itself was occupied by Agum II Kakrime, the ninth king of the Kassite Dynasty, 148 years later, after the extinction of the First Dynasty of Babylon by the Hittite raider Muršiliš I. Agum II Kakrime was 'the first Kassite known to have undertaken restoration of buildings at Babylon. . . . There is no reliable evidence that any earlier king ruled the central provinces'.³ Smith's inference is that the Kassites dated the inauguration of their rāj, not from

by 'King-List A' had overlapped with one another. On the other hand the average worked out at only 12 years apiece for 19 reigns of Kassite kings, out of the total of 36, for which the figures given in 'King-List A' had been preserved. Considering that this Kassite average, if applied to all 36 reigns, would produce a total duration of not more than 432 years for the Kassite Rāj, the figure of 576 years, given for this total in 'King-List A', looks as if it might be too high, even on the assumption that none of the reigns had overlapped with one another, notwithstanding its exact conformity with the general average.

¹ See Smith, *Alalakh*, p. 18.

² In *Alalakh*, pp. 21-25.

³ Smith, *Alalakh*, p. 21.

the completion of their conquest of Babylonia,¹ but from their establishment of their first substantial foothold on Babylonian ground: perhaps from their acquisition of the eastern provinces as a consequence of their 'defeat' by Samsu-iluna, or perhaps from their subsequent extension of this first lodgement westwards over the Kingdom of Khana ('Anah) on the Middle Euphrates.²

Smith points out that two of Agum II Kakrime's (Kassite King No. 9's) successors, Kadashman-Harbe I (No. 16) and Burna-Buriash III (No. 20), were contemporaries of the Egyptian Emperor Amenhotep (Amenophis) III (*imperabat* 1413-1377 B.C., according to Wilson). The interval between Agum II's occupation of Babylon and the death of Amenhotep III would be 218 years (1595-1377 B.C.) according to Dating (b), 154 (1531-1377 B.C.) years according to Dating (c); and the possible duration of Kassite reigns Nos. 9-20 inclusive would be rather longer than this interval, whatever the length of the interval might be reckoned to be, since Agum II may have been on the throne some years before he occupied Babylon, while Burna-Buriash III may have outlived Amenhotep III. Since 12 reigns would run to about 192 years all told on an average of 16 years per reign, and to about 144 years all told on an average of 12 years per reign, it will be seen that Datings (b) and (c) were both alike compatible with the synchronism between the reigns of Kadashman-Harbe I and Burna-Buriash III and the reign of Amenhotep III.

On this showing, the chronology of the Kassite Rāj would not conclusively rule out Dating (c), though Dating (d) would hardly be compatible with the Kassite chronology on any interpretation of it.³

Some Provisional Conclusions from the Evidence as it stood in A.D. 1952

We have now examined six criteria for judging between the four rival datings for a span of 210 years of South-West Asian history, extending from the date of the earliest of the letters in King Šamši-Adad I's diplomatic correspondence to the overthrow of the First Dynasty of Babylon by the Hittite war-lord Muršiliš I. We have found in all six cases that the evidence, up to date, was too fragmentary to allow of either exactness or certainty in our conclusions. Yet, inexact and provisional though these conclusions admittedly were, they did appear to throw some light at least on the relative merits of the four rival datings on the test of the evidence as this stood at the moment. The tentative findings of our inquiry may be tabulated conveniently in the form of an examiner's schedule of marks, if the distinguished scholars whose rival views are here in question will forgive a layman for this rather impertinent treatment of them.

¹ The ninth king, Agum II Kakrime, went a long way towards completing the conquest; for, according to Smith, *ibid.*, this king annexed, not only the city of Babylon, but also 'the District of Nippur, previously held by the Sea-Land Dynasty.'

² The capital of Khana was Tirqa, the modern 'Asharah (Smith, *op. cit.*, p. 22).

³ This was pointed out by Professor W. F. Albright in a letter of the 5th January, 1952, to the writer of this Study.

Criterion	1	2	3	4	5	6
Dating	<i>The Khorsabad List of Kings of Assyria</i>	<i>The Twelfth Egyptian Dynasty in Syria</i>	<i>The Eighteenth Egyptian Dynasty in Syria</i>	<i>The Span of Hittite History between Muršiliš I and Tutkhaliya II</i>	<i>The Hyksos Conquest of Egypt</i>	<i>The Kassite Conquest of Babylonia</i>
(a)	$\gamma-$	$\gamma-$	α	β	α	γ
(b)	$\beta-$	$\beta-$	α	β	α	$\alpha+$
(c)	$\alpha+$	α	α	β	α	β
(d)	$\beta-$	α	β	γ	$\gamma-$	$\gamma-$

In this schedule, $\alpha+$ stands for 'probable almost to the point of certainty', α for 'probable', β for 'possible', $\beta-$ for 'just possible', γ for 'improbable', $\gamma-$ for 'improbable almost to the point of impossibility'. Any attempt to translate these symbols into precise numbers and then to add up each of the competitors' totals would be doubly misleading. It would suggest that it was possible to arrive at a much more definite assessment than was really practicable in A.D. 1952, and it would also suggest that all six criteria were of equal significance, whereas in truth No. 4 was, in its very nature, more subjective than the rest, while Nos. 3 and 5 were nets whose meshes were so loosely knit that they would let through gnats and camels indiscriminately. On this account the signal failure of Dating (d) to satisfy even Criterion No. 5 would have been a damagingly bad mark if there had not been grave doubts whether the date of the Hyksos invasion of Egypt was a valid criterion for our purpose of determining the chronology of South-West Asian history.

When we take into account all six columns of marks, we find that Datings (a) and (d) are both debited with two $\gamma-$, whereas neither Dating (b) nor Dating (c) has any gammas to its discredit. If we take account of Criteria Nos. 1, 2, and 6 only, we find that Dating (a)'s marks are $\gamma-$, $\gamma-$, γ , and Dating (d)'s marks $\beta-$, α , $\gamma-$, whereas Dating (b)'s marks are $\beta-$, $\beta-$, $\alpha+$, and Dating (c)'s marks $\alpha+$, α , β . We may perhaps fairly conclude that, though Dating (d) fares better than Dating (a), both (d) and (a) are practically out of the running, and that only (b) and (c) are left in the field. We may go on to conclude that, though (b)'s marks are appreciably lower than (c)'s, we should not be justified on that account in eliminating (b) and pronouncing (c) to be the winner; for, though (c) looks like the winner on Criterion No. 1, (b) looks no less like the winner on Criterion No. 6. As the evidence stood in A.D. 1952, Dating (b)'s strong point was its consonance with what was known so far about the chronology of the Kassite Rāj in Babylonia, and Dating (c)'s strong point its consonance with what was known so far about the Khorsabad List of Kings of Assyria. These two apparently winning cards could not be played against one another, because there was no means of assessing their relative value. Accordingly, in A.D. 1952 it seemed prudent simply to record Datings (b) and (c) side by side, without attempting to make any absolute appraisal of their respective merits. On the other hand the failure of Dating (a) to fit in with any possible interpretation of the Khorsabad List and its synchronization of Šamši-Adad's diplomatic correspondence with the apogee of the Twelfth Egyptian

Dynasty's ascendancy in Syria were marks which, between them, seemed to disqualify Dating (*a*); and Dating (*d*) seemed likewise to be disqualified by its placing of Hammurabi's death at a lower date than the lowest possible date for the Hyksos conquest of Egypt, together with its failure to allow sufficient time for the duration of the Kassite Rāj in Babylonia even on the shortest credible estimate of this.

The Chronology adopted in Volumes vii-x of this Study.

On the strength of the considerations set out above, the reigns of Hammurabi and of any other sovereigns belonging to the First Dynasty of Babylon have been dated, in passages where they are mentioned in volumes vii-x of this Study, by simply giving the figures according to Dating (*b*) and to Dating (*c*) side by side. Earlier events in Sumeric history have been given corresponding pairs of dates which have been calculated by reducing, to terms of Datings (*b*) and (*c*) respectively, the Time-intervals allowed, for the history of this age, in Eduard Meyer's chronology. The writer is aware that, for reasons given by Sidney Smith,¹ this procedure for dating the pre-Babylonian chapters of South-West Asian history is arbitrary and that the results can, at best, be no more than approximately correct. All the same, it seems better to hazard an approximate dating than to leave all earlier chapters of Sumeric history hanging in the air without even the vaguest chronological *point d'appui*.

In the field of Egyptiac history from the beginning of the Eleventh Dynasty to the end of the Twelfth Dynasty the writer has adopted Parker's chronology,² which, for the most part, is nine years lower than Eduard Meyer's. As for the earlier chapters of Egyptiac history, the writer has felt that here too, as in the Sumeric field, even the vaguest approximation is preferable to 'a perfect and absolute blank', and he has therefore reproduced, here, Wilson's datings,³ which are commended not only by their authorship but by the reassuringly modest tentativeness of their author in his presentation of them. In following the lead of an eminent living Egyptologist in a course that seemed, here too, to be the lesser evil, the writer of this Study was aware that, in these earlier chapters of Egyptiac history, the probability of error—in the state of knowledge as it was in A.D. 1952—was considerable.⁴ Wilson's datings have been followed likewise in the dates given in vols. vii-x of this Study for reigns of pharaohs in the age of 'the New Empire'.⁵

¹ See Sidney Smith's judgement cited on p. 171, above.

² As given in Parker, R. A.: *The Calendars of Ancient Egypt* (Chicago 1950, University of Chicago Press).

³ As given in Wilson, J. A.: *The Burden of Egypt* (Chicago 1951, University of Chicago Press), p. vii. Dr. Sidney Smith, in a letter of the 13th October, 1951, to the writer of this Study, suggests, as minimum datings, the same dates as Wilson suggests for Dynasties III-V inclusive and for Dynasties VI-XI inclusive.

⁴ See Sidney Smith's and W. F. Edgerton's judgements quoted on p. 182, above. Wilson himself notes, in loc. cit., that 'in general it may be said that dates proposed for the period around 3000 B.C. may have a margin of error of 100 years, those around 2500 B.C. of 75 years'.

⁵ Wilson himself notes, *ibid.*, that dates proposed by him for the period around 1500-1000 B.C. may have a margin of error of 10-15 years.

ACKNOWLEDGEMENTS AND THANKS

I

To Marcus, for teaching me to return Thanks to my Benefactors

Marcus Aurelius taught me by example how good and how pleasant it is for a writer to declare his gratitude to his pastors and masters. The first of the twelve books of Marcus's *Meditations* consists of a recital of his spiritual debts; and, when I read the *Meditations* for the first time in A.D. 1913, this one book moved me more than the eleven books containing Marcus's notes of his own philosophy. I was struck by the warmth of the human feeling that this first book displays, and by the sincerity and delicacy with which this feeling is expressed. The lesson that I then learnt from Marcus has been in my mind for the past thirty-nine years, and now the time has come for me to act on it.

II

To my Mother, for making me an Historian

My Mother awakened in me a life-long interest in History by communicating to me her own interest in it at a very early stage of my life. At the youngest age to which my memory can travel back, I was already possessed, thanks to what my Mother had by then already done for me, by a love for History which has never left me. If my Mother had not given my mind—and heart too—this early bent, I am sure that I should not ever have written this book; so she bears some responsibility for the undertaking.

III

To Edward Gibbon, for showing me, by Example, what an Historian could do

Edward Gibbon, in *The History of the Decline and Fall of the Roman Empire*, has always been my cynosure; and I have come to appreciate the greatness of his intellectual powers as I have come to realize that he did almost all that he did do by sheer intellectual prowess, in despite of the handicap imposed on his imagination by the narrowness of his sympathies with the human objects of his historical studies.

IV

To People, Institutions, Landscapes, Monuments, Pictures, Languages, and Books, for exciting my Curiosity

My great-uncle Captain Henry Toynbee (*vivebat* A.D. 1819–1909), who had commanded the East Indiamen *Ellenborough*, *Gloriana*, *Marlborough*, and *Hotspur* and had retired from the sea in A.D. 1866, to become Marine Superintendent of the Meteorological Office in London,

without ever having served on a steamship, made me familiar with the build and life of the full-rigged sailing ship, which had been the master tool of the Western Civilization in its Modern Age, and which has vanished from the face of the seas within my own lifetime.

My great-uncle conjured up for me, as living realities, not only the Modern Western square-rigged sailing ship and the seas over which she sailed, but also the ports in India and China for which she was bound. I could picture the Hoogly pilot coming on board in all his glory, and the laskars chanting sonorous epic poetry as they laboured at the capstan. Every Sunday afternoon my uncle's old friend General Crofton, who lived in Westbourne Square and had sailed from England to India in my uncle's ship with reinforcements during the Indian Mutiny, used to come to tea at our house in London, No. 12 Upper Westbourne Terrace, and I was never tired of hearing the two old men exchanging reminiscences. (On one of these Sundays my uncle's nephew by marriage, Colonel Baden Powell, then just home from Mafeking and at the height of his fame, also came to call; and the two old men, after their usual talk about the Indian Mutiny, finally turned to their junior and asked him politely whether they were not right in thinking that he, too, had lately been on active service somewhere or other, and whether he would not tell them something about it. While my parents and I could hardly contain our laughter, the hero of the South African War had to tell us, as news, all that had been in the headlines months ago. He did what had been asked of him with a good humour that was vastly to his credit.)

The sea captain's and the sapper general's talk, the gigantic triple section of bamboo stem standing by the fireplace in the back part of the dining-room, the copper bonze riding the buffalo (then in the glass bookcase, and today on the mantelpiece in my study), the set of red and white Indian chessmen, Aunt Ellen's water-colour sketches of Indian scenes round the dining-room walls, and the fascinating legend of the duck-barge on the Yangtse, to which the ducks were summoned home at nightfall by a trumpet call—and came home quick, because they all knew that the last duck to return would be soundly thrashed—all this made India and China come alive for me. The evocation of these other worlds in my imagination was completed by my delight in the exotic trees in 'the Flower Walk' in Kensington Gardens, and by the models of Indian houses and villages (monkeys and all) and of Chinese rock-gardens in the Indian Museum. (These last, if I remember right, were gifts from the Manchu Imperial Court to Napoleon which had been intercepted by the British Navy.)

The Albert Memorial in Kensington Gardens peopled my world for me, while I was still in the perambulator, with continents, quadrupeds, poets, artists, sculptors, philosophers, and men of science.

The Indian Museum and the Victoria and Albert Museum in South Kensington, the United Services Museum in Whitehall, the British Museum, the Wallace Collection, the Tate Gallery, the National Gallery, and the Tower of London had put the visible works of Man on my

mental map for me long before I had travelled as far as one day's journey from the Fountains at the head of the Serpentine in Kensington Gardens, which were and are the *omphalos* of my *Oikoumenê*.

Relfe Brothers' *Charterhouse Oxford and Cambridge Atlas*, which I acquired when I went to school in the autumn of A.D. 1896, put on the map for me New York, Vesuvius, and Palestine. A picture of Vesuvius smoking, and an equally exciting sketch-map of New York expanding, faced one another on the frontispiece, and the last map of all—'the World as Known to the Ancients'—excited me because it was centred on the Mediterranean Sea and not on the European peninsula of Asia. On this illuminating map I began to learn the names of the provinces of the Roman Empire; and I remember another boy putting his finger one day on the shore of the remotest corner of the land-locked sea and saying to me, 'That is Palestine'. I could hardly believe that a country which was already so familiar to me from the Bible could be marooned in such an out-of-the-way spot. It was not till long afterwards, when the Indic and the Sinic Civilization had risen above my horizon, that I realized how right our Medieval Western Christian forebears had been in locating the centre of the *Oikoumenê* at Jerusalem, and not at Rome, Paris, Greenwich, or any other point in their own eccentric Feringistan.

Karl von Spruner and Theodor Menke revealed to me the history of the civilizations in the bird's-eye view of cartography, in which, long before the days of flights at the altitude of the stratosphere, the human eye had found a means of taking in at a glance tracts of Space and Time so vast that it would have required innumerable volumes to describe them in the prolix medium of words. The first historical atlas that had come into my hands had been an English one, bought for me in a bookshop in Birmingham by my uncle, Percy Frankland, when I was staying with him and my Aunt Grace in the spring of A.D. 1903 during my convalescence from an illness, and this gift had already given me a new insight into History; but, as far back as I could remember, my Mother had been telling me that the best historical atlas in the World was the German masterpiece 'Spruner-Menke'; on my return to school at Winchester in the summer term of A.D. 1903, I came upon an early edition of this in Moberly Library; and, after that, my first purchase with my first prize money was a set of the latest editions of all three volumes of this supremely great work of German scholarship.¹ My Mother made me a brown holland cover for these folios, as a token that they were a *κτῆμα* *ἐς αἰεὶ*; and, ever since, they have continued to be my constant companions and mentors.

The city of York lifted England for me out of an artificial insularity and put this would-be *alter orbis*² back into its proper place as an

integral part of the *Oikoumenê*. In the names of the streets—Coney Street, Gudrumgate, and the rest—I rediscovered the Danish forefathers of my own family whose home was in the Lincolnshire fens, and I recollected that, in the reign of King Canute, England had been a province of a Scandinavian thalassocracy encircling the North Sea—as, in the days of Constantine the Great, who had been raised on the shield in York, and of Septimius Severus, who had died there, Britain had been a province of a Roman thalassocracy encircling the Mediterranean.

The glory of God, declared¹ in the beauty of *die unbegreiflich hohen Werke*² upon which the puny works of Man have been embroidered, was revealed to me when I saw Parnassus and Helicon and the Acrocorinthus from the Gulf of Corinth; the Acropolis of Athens from round the shoulder of Salamis; Olympus from Dhomokó (a white peak floating on air); Taygetus, stern-on, from Dhimitsána; the mountains of Crete from the crater-rim of Santorin, as they reared their heads out of the sea in the sudden visibility lent to them by nightfall; the Sun setting through the Golden Gate at San Francisco; the Via Appia Antica and the Inland Sea of Japan in the moonlight; Nara haunted by its holy deer; monasteries perched like eyries on the crags of Athos; cenotaphs of the heroes of Japan under the shadow of giant cryptomerias on Koya San; the Great Wall of China wriggling like a snake over billowy mountains; the Roman Wall crowning the crags at Howsteads; the Siebengebirge writhing down on to the Great North European Plain; the Great North Road running out of Seoul to seek Peking; the Rocky Mountains rushing, for an hour before we reached them, to meet our aeroplane at a speed of three hundred miles an hour; the skyline of New York from the eastern approaches; the battlements of the Kremlin at 2.30 a.m. on a winter's night; Lake Baikal with the Sun setting behind its engirdling mountains, as the train picked its way round the southern shore; the valley of the Connecticut River clad in its autumn scarlet and gold; the Mongol Valley of the Shilka and the Ottoman valley of the Hebrus; Boghazqal'eh offering a grander stage than Hisârlyq for the Second Book of *The Aeneid*; the apparition, between serried palm-groves and serried palm-groves, of *majnûn* wharves and refineries at Abadân; Cologne Cathedral looming up at the end of a transcontinental journey home to Western Christendom from Vladivostok; the purple citadel of Jodhpur and the blue sky piercing rose-red marble fretworks at Ahmadabad; the ruins of Rievaulx Abbey from the terrace above; the Sainte Chapelle; Chartres Cathedral; Durham Cathedral seen stern-on from across the river, and the overwhelming first impression of the giant round columns, weirdly carved in hypnotizing patterns; Waynflete's chantry in the cloisters of the College of St. Mary de Winton prope Winton; the ilex in the cloisters of the College of St. Mary de Winton ad Oxon; the Ayía Sophía, the Küchük Ayía Sophía, and the mosque of Mehmed Sököllü Pasha in Istanbul; the tiles in the mosque of Rüstem Pasha; the Qahrîyeh Jâmi'sy with its live

¹ Psalm xix. 1.

² Goethe: *Faust*, I. 249.

mosaics; the Green Mosque at Brusa; the masonry of Aleppo; the Altar and Temple of Heaven at Peking; the Pyramids of the Sun and Moon at Teotihuacán; the church-crowned pyramid at Cholula; Palenque defying the tropical forest; the thirsty cities of the Puuc; Monte Alban, at whose epiphany in his majesty the Acropolis of Sardis dwindles to the stature of a mole-hill; the cock-crows rising, faint but clear, from a sleepy city far below, as the dawn breaks upon the summit of the citadel of Afyūn Qāra Hisār; the blue wall of Taurus rising up sheer on either hand, as we sight it at the watershed *en route* from Nigdeh to the Cilician Gates; the bust of Antiochus the Great and the statue of Julian the Apostate in the Louvre; the bust of Nefertiti in the Reichsmuseum at Berlin.

As a present for my sixteenth birthday, my uncle William Toynbee gave me tickets for my Mother and me to see a performance of Gilbert Murray's translation of *The Trojan Women* of Euripides. As I write this, on the 11th May, 1951, I am taking out of the row of G. M.'s works in the bookcase, given me by my Mother, in my study at 45 Pembroke Square, the copy of the text that we bought at the theatre, with my name in it in my Mother's handwriting, dated '25th April, 1905'. That afternoon, I learnt that a Greek play could be conjured back to life.

My Mother introduced me to Robert Browning. In my fourth year at Winchester his poetry was one of the three special subjects set for our English Literature Prize, and, in the Christmas holidays of A.D. 1905-6, my Mother and I read Browning together. I can remember the evening, in the lamplight, when she opened a volume and said: 'I will begin with *My Star*; I wonder what you will think of it.' Her pleasure at the prospect of sharing her love of Browning's poetry with me had opened my heart to the poet before I had heard a line.

Cyril Bailey introduced me to Lucretius when I was finishing my education in the Hellenic literature by reading for the School of *Litterae Graecae et Latinae* at Oxford.

Supremus veniet, clueat qui dignu' poeta—
Hic deus, hic—fundens divinâ carmina voce.

I could never emulate my tutor's learning in the text of Lucretius's poem¹ or in the philosophy of Lucretius's master Epicurus,² or in the ideas of the atomic school of Hellenic scientists on whose system Epicurus drew for his own ethical purposes;³ but I could and did catch from him his admiration for the Roman poet's work and his love for the nobly austere and sensitive personality that shines through an impersonal exposition of a drab theory about the nature of the Universe.

² *Epicurus: The Extant Remains*, edited by Cyril Bailey (Oxford 1926, Clarendon Press).

³ Bailey, Cyril: *The Greek Atomists and Epicurus* (Oxford 1928, Clarendon Press).

Professor Sir Thomas Arnold and Professor H. A. R. Gibb gave me an invaluable start—not carried farther yet—towards learning Arabic, and ‘Alī Rizā Bey towards learning Turkish.

Reynold A. Nicholson, in his *Translations of Eastern Poetry and Prose*,¹ gave me a glimpse of a Classical Islamic literature that I was unable to read in the original.

Arthur Waley, in his *A Hundred and Seventy Chinese Poems*,² gave me a glimpse of a Classical Sinic literature that I was unable to read in the original.

Moberly Library in the College of St. Mary de Winton prope Winton, the library of Balliol College, Oxford, the Finlay Library and the general library at the British Archaeological School at Athens, the library of the Societies for the Promotion of Hellenic and Roman Studies in London, the library of the School of Oriental Studies in the University of London, and the Long Gallery at Castle Howard opened up for me the vast universe of Modern Western printed books.

Thor Heyerdahl, in *Kon-Tiki*,³ revealed to me ‘the works of the Lord and His wonders in the deep,’⁴ and this revelation taught me the secret of a latter-day Norwegian hero’s Viking ancestors’ achievements.

The genealogy of the descendants of Noah’s three sons in the tenth chapter of the Book of Genesis gave me my first notion of the differentiation of the Human Race into divers groups and sub-groups, and of the historical problems raised by the question how these groups are related to one another. Coming across the chapter, as I did, in a lesson at school when I was seven years old, I was excited to find myself, as I supposed, being admitted to an inside view of the panorama of the unfolding of human history from the bud. It was not till I read E. Forrer’s *Die Provinzeinteilung des Assyrischen Reiches*,⁵ pp. 70–82, that I fully realized the lateness of the date and the shortness of the period represented by the catalogue, given in verses 2–5, of the sons and grandsons of Japheth. This catalogue proves, in the light of Assyriology, to be a mirror of the political map of the northern borderlands of the Assyrian Empire within the hundred years beginning *circa* 725 B.C. All the same, this late and ephemeral Israelitish *mappa mundi* did me the inestimable service of introducing me to the problem of Mankind’s diversity-in-unity.

H. Drummond, in his *Tropical Africa*,⁶ revealed to me, when I was a child, the life of Primitive Man in one of his last fastnesses, at a moment when this primitive way of life was being broken up by the Modern

Western Civilization's steam plough galloping in the tracks of the Islamic Civilization's harrow.

Sir Edward Creasy, in *The Fifteen Decisive Battles of the World*,¹ gave me my first notion of Universal History. In the Time-dimension the book carries the reader's mind backward as far as 490 B.C. and forward as far as A.D. 1815, while in the Space-dimension it carries him outwards, within that span of 2,305 years, from the Basin of the Aegean Sea across South-Western Asia to the Panjab, across the Black Sea to the Ukraine, and across the Atlantic Ocean to North America. Out of the fifteen battles in Creasy's canon of historical scripture, Arbela, Metaurus, Châlons, and Tours were the most fascinating for me. As I read, I saw Alexander, Hannibal, Attila, and 'Abd-ar-Rahmān rise in turn above my horizon; but, while my imagination was being stirred by these titanic figures, my mind was being educated by the intervening synopses of events in which the author had skilfully strung his fifteen great occasions along one continuous chronological thread.

The authors of four volumes of *The Story of the Nations*²—all four of them on my table on this twenty-first day of February, 1951, fifty-three years after they first came into my hands—suddenly revealed to me, when I was eight or nine years old, the histories of the Egyptian, Babylonian, and Syriac civilizations simultaneously, and thereby initiated me into a synoptic view of History which has been illuminating my study of History since then. These four volumes had belonged to my grandmother Harriet Toynbee (her bookplate is in each of them), and, after her death in A.D. 1897, they were given to my Mother because she was the historian in the family. I remember, as if it were yesterday, catching sight, one morning after breakfast, of this batch of unfamiliar green and brown volumes on a familiar book-shelf. Curiosity moved me to pull them out, and, as soon as I opened them, I found them absorbing. They revealed to me a vista that has been widening and lengthening ever since. My first step towards enlarging it was to buy, with savings from my pocket money, Z. A. Ragozin's *Chaldea* (5th ed., 1896),³ to which the same author's *Assyria* had been a sequel. 'Arnold J. Toynbee, March 1899', is inscribed in this volume in my Mother's handwriting.

¹ The copy which my Father gave me in A.D. 1898 was of the forty-first edition, published in that year (London, Bentley).

² The series was published in London by Fisher Unwin. The four volumes that were of momentous personal importance for me were George Rawlinson's *Ancient Egypt* (2nd edition, 1887); Z. A. Ragozin's *Assyria* (1888); Ragozin's *Media, Babylon, and Persia* (1889); Arthur Gilman's *The Saracens* (1887).

³ The first edition of *Chaldea* had been published in A.D. 1886. Notwithstanding the title of this book, the subject of it was not the wanderings of the Chaldaean Nomad barbarians who had filtered into the south-western fringes of the Land of Shinar out of the North Arabian Steppe in a Völkerwanderung circa 1425-1125 B.C.; it was the genesis and growth of a civilization that, in this Study, has been labelled 'the Sumeric' after the name of the Sumerian people who originated it. The Biblical terminology 'Ur of the Chaldees' (Genesis xi. 31) had led the Western discoverers of this long buried forgotten culture to jump to the mistaken conclusion that the Chaldaeans had been the latest comers before the Sumerians, instead of realizing that they had been the latest comers before the Arabs.

A. J. Church's *Stories of the East from Herodotus*¹ introduced me to the vast and variegated landscape of Herodotus's *Oikoumenē*. The pictures opened my eyes to two distinctive styles of art that were the respective signatures of the Egyptian and the Babylonian Civilization.

J. P. Mahaffy, in his volume² on *Alexander's Empire*³ in the *Story of the Nations*, revealed to me the post-Alexandrine chapter of Hellenic history. I can remember my excitement when, as I opened the book in the foyer of a theatre to which my parents were taking me during one of my holidays from school, I came upon the map showing Hellenism pushing its way from European Greece into the Indus Valley across all the derelict satrapies of a shattered Achaemenian Empire. But it was not till I opened the book again, after an interval of many years, on the 17th April, 1951, that I noticed and appreciated the author's historical insight in reproducing on the cover the bust, not of Alexander, but of Epicurus.

Edwyn Bevan, in his *The House of Seleucus*,⁴ carried me farther into the fascinating study of post-Alexandrine Hellenic history into which I had been initiated by J. P. Mahaffy in his *Alexander's Empire*. Afterwards, when I had the happiness of coming to know Edwyn Bevan personally, I learnt more from this great Christian historian than even he knew how to put into any book.

Emil Schürer, in his *A History of the Jewish People in the Time of Jesus Christ*,⁵ revealed to me the illuminating historical truth that, in the time of Christ, the Coele Syria that had been conquered from the Ptolemies by the Seleucidae in 202–198 B.C. was a cultural arena in which the Jewish forlorn hope of a Syriac Society was engaged with an aggressive Hellenism *corps à corps*. I vividly remember a Sunday morning at Winchester in Cloister Time, A.D. 1907, when, as I was reading the Second Division, volume i, paragraphs 22 and 23, of Schürer's *History* in bed before breakfast, I made the exciting discovery of the Hellenic city-states—ranged in a pair of parallel tiers, one tier along the coast and another along the well-wooded and well-watered uplands of Transjordania—of which I had already taken a visual cognizance, without having grasped their full historical significance, on two maps⁶ in Spruner's *Atlas Antiquus* on which they were coloured a conspicuous red and were labelled 'urbes Graecanicae'. This summer's morning, as I began to make myself better acquainted with this Coele-Syrian galaxy of Hellenic city-states in Schürer's industriously compiled gazetteer, I learnt for the first time that an Hellenic Gadara, which had been notorious to its Jewish neighbours in the time of Christ for nothing but

¹ London 1881 [1880], Seeley.

² Dedicated to the father of my two contemporaries and friends, Allen and Rex Leeper.

³ Sixth edition: London 1895, Fisher Unwin.

⁴ London 1902, Edward Arnold, 2 vols.

⁵ English translation: two parts in five volumes, with a sixth volume containing an index: Edinburgh 1890–1, Clark.

⁶ Nos. XIII ('Mare Internum cum Populis Adiacentibus à Pompeii ex Asiâ Reditu usque ad Bellum Actiacum') and XXVI ('Judaea Maccabaeorum Tempore').

a Gentile disregard of the Mosaic tabu against breeding swine, had given birth, at the turn of the second and the last century B.C., to the Meleager who was the author of the famous garland poem in the *Anthologia Palatina*, and thereafter to a Theodorus who had made himself sufficiently eminent as a professor of Greek literature to obtain the post of tutor to the future Emperor Tiberius. As this fresh light on the scene of the stampede of the Gadarene Swine began to dawn on me, I felt as if the early morning sunlight, which at that moment was turning the walls of Chapel into glowing gold, were performing some equivalent alchemy in my mind.

Canon George Rawlinson, in *The Seventh Great Oriental Monarchy*,¹ which I read during my convalescence from an illness in the winter of A.D. 1902-3, revealed to me a Sasanian chapter of Iranian history in which Iran had held her own against a Rome that had commanded the united forces of the entire Hellenic World.

V. A. Smith, in *The Early History of India*,² revealed to me the histories of the rise and fall of the Indic Civilization and the rise of its Hindu successor. I stumbled on an early edition of it in the library of Balliol College, Oxford, in A.D. 1907. A later edition has been one of my constant companions since April, 1920.

Friedrich Hirth, in *The Ancient History of China*,³ revealed to me the history of the Sinic Civilization down to a date thirty-five years short of the founding of a Sinic universal state by Ts'ing She Hwang-ti. I stumbled on a copy in one of the book-shops on the south side of Broad Street, Oxford, while I was an undergraduate. A copy of the second reprint, bought in Boston, Mass., in October 1925, has been one of my constant companions.

Sir William Tarn, in *The Greeks in Bactria and India*,⁴ revealed to me the crucible of the Mahāyāna.

Sir Aurel Stein, in a lantern lecture on his Central Asian expedition of A.D. 1907-8 which he gave in the great hall of the Examination Schools at Oxford while I was an undergraduate (*studia Oxoniae exercebam* A.D. 1907-11), revealed to me the Central Asian corridor in which the Indic and the Judaic religions had once run into one another and had afterwards travelled forward abreast on their eastward journey into a Sinic World. I followed up the vista that had been opened for me in this lecture by reading the archaeologist-explorer's *Sand-Buried Ruins of Khotan*.⁵

Sir Charles Eliot, in his *Hinduism and Buddhism*,⁶ gave me the sensation of being shown the other side of the Moon by revealing to me the

³ Published in New York in A.D. 1908 by the Columbia University Press.

⁴ Cambridge 1938, University Press.

⁵ M. A. Stein: *Sand-Buried Ruins of Khotan* (London 1904, Hurst & Blackett).

⁶ London 1921, Edward Arnold, 3 vols.

history and *éthos* of that half of the *Oikoumenê* that has received its higher religious illumination from an Indic, and not from a Judaic, source. My geographical horizon, historical vista, and gamut of spiritual experience had all been doubled before I had finished reading this great book.

Michael Rostovtzeff, in his *Iranians and Greeks in South Russia*,¹ revealed to me the Nomad Civilization of the Great Eurasian Steppe.

Sir Henry Yule, in his edition of Marco Polo's book,² and Sir Henry Howorth, in his history of the Mongols,³ revealed to me the heart of the Eurasian Steppe, with an *alter orbis* in Eastern Asia, on the far side of it, which Herodotus leaves still tantalizingly veiled when he lifts one corner of the curtain of ignorance to uncover the waterless ocean's western bay. I shall never forget my sensations when, one evening in June 1908, as the night-train for Aberdeen slid out of King's Cross Station, I opened the first volume of Howorth's pioneer work and saw a vast unknown landscape spread itself before my eyes: Kin and Sung and Tangut; Qāra Qitāy and Khwārizm; Naiman and Karāyit. When the train slid into Edinburgh early on the following morning, I was still busily taking on board a cargo of exciting new knowledge that has been a key part of my mental furniture ever since. Propped up with a pillow in my third-class corner-seat, I was sleepy but unsated. Thanks to Howorth's infectious enthusiasm for his subject, I had, I believe, that night, at second hand, some inkling of 'Messer Millione's' excitement when he saw his first sight of China with the eyes of the flesh.

W. H. Prescott, in his *History of the Conquest of Mexico*, which was read aloud to us at my preparatory school, put the civilizations of the New World on my mental map for me.

The Maudslay Collection revealed to me the history of the Mayan Civilization. As I was wandering round the British Museum one day in A.D. 1923, I stumbled on a room in which the central object on exhibition was a cast of a stone of a tortoise-like shape, but far larger than the largest giant tortoise that I had ever seen at the Zoological Gardens in Regent's Park; and I found that this object and its companions were covered with reliefs in a style, new to me, which was reminiscent of the Egyptian, the Sumeric, and the Sinic, and yet was distinctively different from each and all of these. These casts and originals—the fruits of A. P. Maudslay's field work in Mayan lands since A.D. 1881—had then just been brought up from the basement of the South Kensington Museum and placed on view in Bloomsbury. I did not leave the British Museum that afternoon without having bought the *Guide to the Mauds-*

¹ Oxford 1922, Clarendon Press.

² *The Book of Ser Marco Polo*, translated into English by Sir H. Yule, 3rd ed., revised by H. Cordier (London 1903, John Murray, 2 vols.); Notes and Addenda by H. Cordier (London 1920, John Murray).

³ Howorth, H. H.: *History of the Mongols*, Parts I–III in 4 volumes (London 1876–1888, Longmans Green); Part IV, Supplement and Indexes (London 1928, Longmans).

lay *Collection of Maya Sculptures from Central America*, published in A.D. 1923 by order of the Trustees. The exhibits and the guide-book, between them, introduced me to a culture which had previously been beyond my historical horizon. I ascertained that the object which had first caught my eye was a cast of 'Monolithic Animal P' from Quiriguá. From that day onwards, the Mayan Civilization had a place on my mental map.

When, in July 1908, I was staying with my Mother's former pupil and life-long bosom friend Urith Perrot in her house at Blellach, near Dinnet, on Donside, I found there in the library Lactantius's *De Mortibus Persecutorum* and the Nuremberg Chronicle, and sat up reading them into the small hours of those twilight midsummer Scottish nights.

Thomas Hodgkin, in *Italy and her Invaders*,¹ awakened my interest in the post-Hellenic interregnum when I found and read the book in Moberly Library at Winchester.

The Benedictine Abbey at Ampleforth has made me aware of the spiritual impetus of the Western Christian monastic life, and has shown me that the secret of the historical continuity of the Benedictine Order is the whole-heartedness of the faith of Saint Benedict's spiritual sons. Listening to the singing of the Office in the church, and reminding myself that this *opus Dei* had been carried on without a break throughout the fourteen hundred years that had passed since the Founder's generation, I came to realize that this Western religious community, which was the matrix of Western Christendom, possessed a greater vitality than any of the secular institutions that had hived off from it. Driven from Westminster on to the Continent by the outbreak of the Reformation, this particular Benedictine community had struck root again at Dieulouard in Lorraine, where, for the next quarter of a millennium, it had been kept alive by a constant supply of English postulants who could follow the monastic calling only at the price of expatriation. Driven from Dieulouard back to England by the outbreak of the French Revolution, the community had struck fresh root in the vale of Ampleforth in Yorkshire. How had it managed to survive these successive uprootings? This question has been answered for me by my experience of the friendships that I have had the happiness of making with some of this community's living members.

My Mother made me aware that there had been a Byzantine, as well as a Carolingian, Empire, and that the Normans had conquered Sicily as well as England.

E. A. Freeman's *Historical Essays*² opened up for me vistas of Western and Hellenic history that led me out into the great open spaces beyond.

¹ Oxford 1892-9, Clarendon Press, 8 vols. in 9 parts.

² London: First Series 1871; Second Series 1873; Third Series 1879; Fourth Series 1892: all published by Macmillan.

Charles Oman, in *A History of the Art of War from the Fourth to the Fourteenth Century*,¹ introduced me to the Cataphract² and made it clear to me that an age which had witnessed so great a revolution in military technique as the Late Roman reversion to cavalry from infantry could not be a mere epilogue, but must mark the opening of a new chapter of history. The Psalter of Theodore of Caesarea, from which Oman had reproduced some of the pictures of Byzantine fighting men, was shown to me by a friend of my Mother's in the British Museum.

Geoffroi de Villehardouin, as I sat reading his *Conquête de Constantinople* in de Wailly's attractive edition³ by the fireside in my Uncle Paget Toynbee's library at Fiveways, Burnham, Bucks, in December 1906, made me repeat to myself Lewis Carroll's satirical poem the *Walrus and the Carpenter* when I came to the gifted Champenois adventurer's unctuous account of the pious tears which the Frenchmen and the Venetians shed together over their cold-blooded bargains at Zara's and Byzantium's expense. I remembered that evening when, on the 21st February, 1912, I first set eyes on the Villehardouins' castle at Kalamáta.

Under Campbell Dodgson's auspices, my Mother and I spent many hours in the Print Room of the British Museum looking at Albrecht Dürer's drawings and sketches.

George Finlay, in *A History of Greece from its Conquest by the Romans to the Present Time, B.C. 146 to A.D. 1864*,⁴ revealed to me the disintegration of the Ottoman Empire and the cultural reorientation of the Millet-i-Rûm from an Ottoman to a Western *qiblah*.

Colonel G. F. R. Henderson's *Stonewall Jackson*,⁵ which my father gave me to read in the summer holidays one year while I was at school at Winchester, revealed to me both the tragedy and the romance of the American Civil War.

Beech Point, near Danville, Kentucky, where I stayed with my dear friend Robert Shelby Darbishire for the first time in the summer of A.D. 1925, gave me a glimpse, from inside, of a post-Bellum rural South that was then still as remote in spirit from Cincinnati, across the Ohio, as I found Lithuania to be from East Prussia when I crossed another cultural frontier there in the spring of A.D. 1928.

¹ London 1898, Methuen.

² This early introduction to a type of military accoutrement which has never ceased to fascinate me once got me into trouble when, at my preparatory school, I was given, for translation into Latin, an account in English of Crassus's march eastward in 53 B.C. When I came to a sentence recording the King of Armenia's advice to the Roman commander to hug the Armenian foothills and give a wide berth to the Mesopotamian plains for fear of the Parthian cavalry, I translated the English word 'cavalry' by the Latin word 'cataphracti'. 'Where on earth did you run across that outlandish word?' asked the master, as he crossed it out in red ink and substituted a banal 'equites'. I dared not protest or even explain; yet I knew that no stroke of a magisterial pen could really avail to divest those Parthian centaurs of their iron carapaces.

³ Paris 1882, Firmin-Didot.

⁴ New edition, revised by H. F. Tozer: Oxford 1877, Clarendon Press, 7 vols.

⁵ London 1898, Longmans, Green, 2 vols.

Sir Herbert Maxwell, in his *Sixty Years a Queen*, 'The Story of Her Majesty's Reign, Illustrated Chiefly from the Royal Collections',¹ revealed to me, in his panorama, the achievements of Victorian England.

My Mother's account of her conversation with the disgruntled custodian of the deserted royal palace at Hanover, when she visited it during her stay in Germany in A.D. 1885, made me realize, even as a child, that all was not well under the surface in Prussia-Germany.

Sir Lewis Namier, when he made his memorable first appearance at Balliol College, Oxford, as an undergraduate, in A.D. 1908, put on my mental map for me the Danubian Hapsburg Monarchy and the Jewish Pale, which were then still quite unknown worlds for English undergraduates of our generation, though, within seven or eight years from then, half of us were to lose their lives in a general war fought to prevent Germany from establishing an ascendancy over Eastern Europe which, at the next stage, would have enabled her to make a bid for world dominion.

R. W. Seton-Watson ('Scotus Viator'), in his *Racial Problems in Hungary*,² lent to me by A. E. Zimmern in the summer term of A.D. 1909, illuminated for me a plague-spot in the East European landscape that Sir Lewis Namier had brought within my horizon.

Though 'historical novels' are apt to set my teeth on edge by offering me a stone instead of bread, I should be ungrateful indeed if I failed to acknowledge my debt to Herodotus for his tales of Mycerinus and Rhampsinitus and Nitocris, to Leo Tolstoy for his *War and Peace*, to Naomi Mitchison for her *The Corn King and the Spring Queen*,³ to L. S. Woolf for his *The Village in the Jungle*,⁴ to O. E. Rølvaag for his *Giants in the Earth*,⁵ to Georg Moritz Ebers for his *Uarda*,⁶ to Victor Hugo for his *Quatre-Vingt Treize* and *Les Misérables*, and to Émile Erckmann and Alexandre Chatrian for their *Le Blocus*. When I looked in at Phalsbourg on the 26th July, 1929, *en route* from Calais to Constantinople, its bastions and casemates were already so familiar to me that I could hardly believe that I was now setting eyes on them for the first time. I had found *Le Blocus* in a row of discarded books on a shelf in the pantry at No. 12 Upper Westbourne Terrace, and *Quatre-Vingt Treize* on a shelf in my Aunt Gertrude Toynebee's flat.

C. G. Jung, in his *Psychological Types*,⁷ opened up for me a new dimension in the realm of Life. The admirable catholicity with which Jung draws upon materials of the most diverse kinds for the illustration of his themes enabled me to find my way into the *terra incognita* of the

¹ London 1897, arranged and printed by Eyre & Spottiswoode, published by Harmsworth Bros.

² London 1908, Constable.

³ London 1913, Edward Arnold.

⁴ London 1931, Cape.

⁵ New York 1927, Harper.

⁶ English translation by C. Bull, Leipzig 1877, Low, 2 vols.

⁷ English translation: London 1923, Kegan Paul.

Psyche's subconscious abyss by proceeding from the known to the unknown. I was fascinated to watch, under Jung's analysis, the same primordial image coming to light in a familiar myth and in some *rebarbatif* clinical case in Jung's own professional practice which might have repelled my mind if my interest in the analysis of the myth had not drawn me on to take a consequent interest in the myth's clinical counterpart.

After Jung had thus given me the freedom of the New World of Psychology, I found here the equivalents, in the experience of the Soul, of a number of phenomena that I had already observed for myself in the experience of Society. The polarization of the *libido* (psychic energy) when it strikes an obstacle was the equivalent of the schism in the Body Social (mirror of the Soul) after a failure to respond to a challenge. The depression of subordinated functions into the Subconscious was the equivalent of the estrangement of a proletariat from a dominant minority. The explosive discharge of obstructed *libido* was the equivalent of a Völkerwanderung of barbarian war-bands when the *limes* behind which they have been pent up at last gives way in a collapse that had been symbolized for me in the bursting of the Dam of Ma'rib. A salvation proceeding from the Subconscious was the equivalent of a salvation proceeding from the Internal Proletariat. The re-emergence, after a submarine voyage, of splinters of conscious psychic life that have been submerged in the Subconscious was the equivalent of the re-emergence in the myth of Jesus, after a submarine voyage along the underground river of Folk-Memory, of a history of Agis and Cleomenes which had descended into the folk-lore of an Internal Proletariat. The projection of elements of the Subconscious upon external objects was the equivalent of the radiation of elements of the life of a disintegrating civilization into its external proletariat.

V

To People and Books, for teaching me Methods of Intellectual Work

H. J. Haselfoot, who initiated me at Wootton Court School, Kent, into the art of coping with unseen translations from Ancient Greek authors in preparation for the Winchester College scholarship elections of A.D. 1901 and A.D. 1902, taught me the sovereign intellectual art of deliberately taking time—even when time is short—to let the mind play round a problem and try to grasp it as a whole before plunging into any attempt to solve it in detail. This is the most valuable single lesson in intellectual method that I have ever been given. It made so deep an impression on me at the time that I was able to take it to heart, and I have used it, ever since, in every piece of intellectual work that I have ever undertaken.

I remember that my master and I started operations together on a description of a naval battle in Thucydides' *History of the Atheno-Peloponnesian War*. My master used this text (I think it must have been Book II, chapter 91) to show me how to arrive at the meaning of the Greek word *μετέωρος* by bringing my scanty acquaintance with the Greek vocabulary into relation with the context of the word in this passage.

This was a masterly piece of educational work for which I am abidingly grateful.

J. A. Smith allowed me to educate myself by listening in to a spacious and fertile mind thinking aloud.

The experience of working in H.B.M. Foreign Office in Whitehall during the First and then again during the Second World War taught me, as a temporary civil servant, two lessons that I have found invaluable for an historian.

The first lesson is that the acquisition of information is, not an end in itself, but only a means to the end of taking action. In the service of a government or any other institution, the action which is the purpose of the acquisition of information is, of course, action of the 'practical' kind; but the golden rule which I had learnt in the Foreign Office from the business of acquiring information for use in such 'practical' action proved to apply with equal force to an historian's work. Action taken on any plane will be in danger of going wrong if it is not taken in the light of the truth and of nothing but the truth; but it will be in equal danger of getting nowhere if it is not also taken in the light of no more of the truth than the minimum that is relevant to the particular piece of action that is on the current agenda.

This golden rule which the Intellect has to learn for itself by 'practical' experience has been made fool-proof on the subconscious level by being made there to work automatically; for the human Memory, as Bergson has pointed out, is a psychic mechanism which gives the Will a chance of taking action by withholding from the Consciousness every record in the vast and ever growing complete collection of past impressions that lies stored in a subconscious psychic depository, unless and until a particular record is required by the Consciousness for the practical purpose of enabling the Will to put some design into effect. If the mechanism of the Memory did not thus implacably withhold from the Consciousness all registered information that was not pertinent to the action in hand, the Consciousness would be paralysed, and perhaps even be driven mad, by an overwhelming flood of irrelevant recollections.

This first lesson that is to be learnt from working in a department of state has a second as its corollary. The information that is to be found in an official document will have been put there—if we may assume that the document has been drafted competently—in order to serve some official purpose which, whatever it may have been, will certainly not have been the irrelevant purpose of informing a future historian. The relevancy of documents to their 'practical' purposes increases their potential value as pieces of historical evidence, but the historian will not be able to profit by them for his own intellectual purpose unless and until he succeeds in rediscovering, or reconstructing, those quite different purposes for which they were made.

John Stuart Mill, in his *Autobiography*, taught me to keep my mind fresh by alternating, on some regular rhythm, between different kinds

of intellectual work. Between the wars I used to write the Chatham House Survey of International Affairs in the winter and spring in London and *A Study of History* in the summer and autumn in Yorkshire. In writing Parts VI–XIII of *A Study of History* since the 1st July, 1947, I have been able—thanks to the generosity of the Rockefeller Foundation of New York in making it possible for Chatham House to release my time to the necessary extent—to follow a daily cycle in London, working at home in the mornings and at Chatham House in the afternoons. The shorter the wave of this alternating rhythm of intellectual work, the longer, in my experience, is the time for which it is possible to go on working continuously on a long task without the mental engine's 'seizing'.

From seeing the mighty remains of Venetian fortresses in the Levant, I learnt to know something of Venice herself without having set eyes on her. From observing the impacts made by the Western Civilization upon other societies, I came to know something of the *êthos* of the West without having studied Western history.

Plato taught me, by example, not to be ashamed of using my imagination as well as my intellect. He taught me, when, in a mental voyage, I found myself at the upper limit of the atmosphere accessible to the Reason, not to hesitate to let my imagination carry me on up into the stratosphere on the wings of a myth. In never being either too proud or too timid to take to a myth for the sake of reconnoitring regions of the Spiritual Universe beyond the Reason's range, Plato was showing both the humility and the audacity of a great mind, and this Hellenic philosopher's example fortified me in an adverse Western mental environment in which I did not find any outstanding contemporary good example to follow. I have now lived to see the subconscious well-spring of Poetry and Prophecy restored to honour in the Western World by the genius of C. G. Jung; but, before Jung's star at last rose above my horizon, Plato's example, brought within my ken by an Hellenic classical education, had given me courage to part company with an early-twentieth-century Western *Zeitgeist* whose oracles were scales and dividers because, in this *Geist*'s self-blinkered eyes, the only realities were those that could be weighed and measured.

Lionel Curtis taught me, by example, a method of production and an attitude of mind which I have found, by experience, to be a sovereign help in dealing with difficult and, above all, with controversial subjects. He taught me that, in the writing of a book, as in every other human activity, the worst of all vices is the hybris that is the nemesis of self-conceit. An author is convicting himself of being past praying for if ever he allows the Old Adam in him to close his mind to a suggestion for some modification of his first draft by answering 'What I have written I have written.'¹ An author had better retire from business if he has not the humility to conceive of the possibility that, after all, he may be mistaken,

¹ John xix. 22.

and if he has not also the common sense to see, in the living authorities on his subject, not critics to be combated after publication, but mentors to be consulted before it, at a stage when it is still not too late to profit by their fruitfully chastening strictures. Taking my cue from Lionel Curtis, I have learnt to put my work through two stages when a controversial subject is on my agenda. The first stage is to produce as good a draft as I can manage out of my own resources. The second stage is to circulate this draft to a number of authorities who have divers experience, knowledge, standpoints, and feelings, and then to rewrite the passage in the light of their comments on the first draft. The first stage is indispensable because a draft is apt to draw comment—in contrast to a questionnaire, which is apt to find its way into a pigeon-hole, if not into the waste-paper basket. But this first stage is merely a prelude to the second, which is the fruitful one. The process of re-writing in the light of comments is fruitful because a synoptic view of comments from different angles gives an author a stereoscopic vision of his subject which is not attainable by a single pair of eyes. This method of taking counsel's opinion does not, of course, dispense the author from the responsibility of eventually taking a line of his own and staking his head on this. But it does put it in his power to give himself the best chance open to him of being of some service to his readers.

VI

To People and Books, for teaching me Methods of Literary Presentation

Theodor Mommsen, in *The History of the Roman Republic*, which I read, in my Aunt Gertrude Toynbee's copy of the English translation,¹ during the summer of A.D. 1907, between leaving school and going up to the University, taught me that an historical work was a better presentation of history for being also a work of art.

Pindar, the Attic playwrights, and Herodotus, interpreted for me by Sir John Myres,² taught me the use of the symmetrical rhythm of strophe and antistrophe. Herodotus also taught me his art of lightening the load on the main thread of a narrative by stowing away into annexes any matter remote enough from the central theme to be detachable from it, but not so remote that it could be simply left out of the book.

Aristotle taught me his method, of which he makes a masterly use in the *Politics*, of illustrating general propositions about human affairs by recounting apposite historical anecdotes.

Lucretius, in his *De Rerum Naturâ*, Book I, lines 58–61, taught me the literary value of ringing changes on synonyms for conveying the key terms in a system of ideas, as a device for avoiding the monotony of the effect that would be produced by invariably employing the same word

¹ English translation by W. P. Dickson: London 1887–8, Bentley, 4 vols. My Aunt Gertrude's copy, with my name written in it in her handwriting, dated 'September 1906', is here on my desk in May 1951.

² See Myres, J. L.: *Herodotus: Outline Analysis of Books I–VI* (Oxford 1912); *Herodotus, Father of History* (Oxford, 1953, Clarendon Press).

to denote the same inevitably oft-recurring term of art. His adroitness in manœuvring his cohort of interchangeable synonyms signifying atomic particles of matter—primordia, principia, prima elementa, corpora prima, semina rerum, genitalia corpora rebus¹—moved me to follow his example by ringing changes of my own on such approximately synonymous words as 'civilization', 'society', 'culture', and 'world' and approximately synonymous compound terms as 'universal state' and 'oecumenical empire'.

Clarendon, in *The History of the Rebellion and Civil Wars in England begun in the Year 1641*, taught me always to give a reference in a footnote to chapter and verse for every quotation that I made from the Bible. If this was good practice in England in Clarendon's day, when the Authorized Version of the Bible was a household book, it ought not to be abandoned in our time, when the Bible is rapidly passing into oblivion in the English-speaking countries. On this principle, I have given references for my quotations, not only from the Bible, but also from the Greek and Latin Classics.

I am thankful for the personal good fortune of having been born just not too late in the day to receive an old-fashioned English humane education in the Classics and in the Bible. Enough of the language of the Authorized Version of the Bible has lodged itself in my memory, through having repeatedly come to my ears in the lessons read in church, to bring into my mind, when I am writing, a flow of phrases, or reminiscences of phrases, from the Scriptures.² But I was born too late to become a *hāfiz*, even in the sacred book of my own ancestral religion; I know by heart only a word or two of the Qur'ān; and I have no acquaintance at all with the Pāli Scriptures of the Hinayanian sect of Buddhism or with the Confucian Classics. If I had managed to possess myself of these spiritual riches, I might have been able to do greater justice to the subject of this Study.

F. M. Cornford, in his *Thucydides Mythistoricus*,³ taught me to indicate, by the use of an abstract noun with its initial letter printed as a capital, the presence of one of those psychic principalities and powers—'The Tragic Passions', as Cornford calls them—for which there are no proper names in the sterilized vocabulary of a rationalist latter-day Western Society. Hilm and Aidôs, Civilization and Democracy and Industrialism, Archaism and Futurism, Time and Space, Law and

¹ See Cyril Bailey's edition of the *De Rerum Naturâ* (Oxford 1947, Clarendon Press, 3 vols.), vol. i, p. 140.

² An English-speaking writer who has been brought up on the Authorized Version of the Bible is apt to take the use of its language for granted. Sir Lewis Namier, who had grown up in a Catholic country where the living Polish vernacular was impervious to influences emanating from the Latin of the Vulgate and the Liturgy, once passed on to me his own exciting discovery, made by him in England, that an archaic translation of the Bible and the Liturgy into a living vernacular enhances this fortunate language's powers of expression, not only by doubling its vocabulary, but also by giving a speaker or a writer an effective means of evoking emotion, in any degree that he may desire, by drawing on the Bible for reinforcements, ranging from faint allusions to explicit quotations, in support of the pedestrian language of every-day life.

³ London 1907, Edward Arnold.

Fortune, are a few examples, taken at random. This usage has, of course, its own drawback. On the analogy of personal names, it might be misinterpreted as conveying the false, and unintended, suggestion that these presences are personalities, when the truth is that they are non-personal emanations from a subconscious abyss of the Psyche that is the matrix of personalities as well. Yet a usage suggesting personification is at any rate less misleading than one suggesting that these entities are abstractions—as would be implied by printing the initial letters of the corresponding English words in lower-case type—for, though they are not personalities, they are charges of psychic energy that have power to work weal and woe in human affairs, and the lack of proper names for them in a latter-day Western vocabulary betrays a tell-tale lacuna in Modern Western thought and imagination and feeling. There are more things in Heaven and Earth than are dreamed of in Horatio's Western philosophy. τὸ πᾶν δαιμόνων πλήρες;¹ and, if I had been writing in either Greek or Latin, I should never have been troubled with this problem of semantics. The Greek word *δαιμόνες* and the Latin word *numina* bear joint witness to an awareness in Hellenic souls that these non-personal psychic presences are potent live realities.

In looking on at a Japanese puppet show at Osaka one afternoon in November 1929, I duly found, as I had been assured beforehand that I should find, it possible to entertain the illusion that the puppets were animated by an autonomous life of their own, although the human artists manipulating them were in full view of the spectators. An artistic effect which, in the West, would have been produced by the artifice of keeping the manipulators out of sight, was produced in Japan by their artistry in keeping themselves out of mind notwithstanding their visibility. The Japanese manipulators achieved this *tour de force* of managing to deflect the spectators' attention away from themselves and on to their puppets by making their own movements appear lifeless and their own countenances impassive. They succeeded, in fact, in subjectively effacing their objectively visible living human forms; and this *chef-d'œuvre* of Japanese art taught me a trick for serving my readers' convenience by signalling to them the careers and dates of persons mentioned in my text without distracting their attention from the narrative. I learnt to make these useful insertions unobtrusive by putting them into Latin and printing them in italics between brackets.

VII

To People, Monuments, Apparatus, Pictures, Books, and Events, for giving me Intuitions and Ideas

Robert Browning presented me with the phrase 'Challenge and Response'. I had flattered myself that this phrase was of my own coinage

¹ νοῦν τοῦ κόσμου τὸν Θεόν, τὸ δὲ πᾶν ἐμψυχον ἅμα καὶ δαιμόνων πλήρες (Thales, fragment 23); πάντα πλήρη θεῶν εἶναι (Thales, fragment 22).—Diels, H.: *Die Fragmente der Vorsokratiker*, 5th ed., vol. i (Berlin 1934, Weidmann), p. 79.

till, more than ten years after I had first put it on paper, I came upon it in the fourth stanza of Browning's *Master Hugues of Saxe Gotha*:

—O you may challenge them, not a response
Get the church-saints on their rounds!

The collocation of the two words must have lain submerged on some subconscious level of my mind for about a quarter of a century since the Christmas holidays of A.D. 1905–6, when I had first read the poem with my Mother. When I fancied that I was inventing it, I was only hauling it up from the hold of my memory.

Professor F. J. Teggart, in his *Theory of History*,¹ chapter 14, showed me where to find the entry into my subject after I had been groping for it without succeeding in discovering it by my own native lights.² The baffling obscurities in my initial problem of method and procedure were illuminated for me by Teggart's dicta³ that 'in the study of Man . . . the first step must be a return to the Present'; that 'the point of departure must necessarily be observation of the differences which particularize the condition of Humanity in different parts of the World'; and that 'the observation of the cultural differences which distinguish human groups leads at once to a recognition of the major problem of the Science of Man', namely: '“How are these differences to be accounted for?”'; "How have the differences which we observe in the cultural activities of men come to be as we find them at the present time?"' I took these directives to heart, and have followed them from beginning to end of the present work. They have proved to be a sovereign clue which has not only initiated me into my subject but has piloted me through it.

Alfred Zimmern taught me, eight years before the publication of Benedetto Croce's *Teoria e Storia della Storiografia* in A.D. 1917, that 'all true history is contemporary history'.⁴ I learnt this from the intellectual ferment raised in my mind in New College hall in the summer term of A.D. 1909 as I listened to A. E. Z. delivering a course of introductory lectures on Hellenic history, for undergraduates starting to read *Litterae Humaniores*, which was the matrix of *The Greek Commonwealth*.⁵ As I sat listening to those catalytic words, the conventional partitions between 'Past' and 'Present' and between 'Ancient' and 'Modern' dissolved out of my mind and have never since returned to hamper it. I had learnt that life, thought, and feeling in the Hellenic World in the fifth

¹ New Haven, Conn. 1925, Yale University Press.

² In my first attempt, made in the summer vacation of A.D. 1920, I had tried to cast my ideas into the form of a commentary on the second chorus in Sophocles' *Antigone* (ll. 332–75). The theme of this poem—"The Mystery of Man"—was apposite and the poetry was magnificent, but the approach was unpromising; for this expedient of referring a question to some classical oracle was the Medieval and Early Modern Western approach into which I had been initiated at school, whereas the intellectual enterprise on which I had now embarked was an attempt to take bearings in the uncharted seas of a post-Modern chapter of Western history. My appeal to Sophocles had, in fact, been a false move, and it was therefore neither surprising nor regrettable that it had been a failure.

⁴ 'Ogni vera storia è storia contemporanea'—Croce, B., op. cit., 2nd ed. (Bari 1920, Laterza), p. 4.

⁵ Published by the Oxford University Press (1st ed., 1911; 2nd ed., revised, 1915).

century B.C. were living presences working upon me in a fourteenth-century Western Christian hall in which a crowd of twentieth-century Western undergraduates was sitting at that moment at the feet of a master.

Eduard Meyer, in his essay 'Der Gang der Alten Geschichte: Hellas und Rom',¹ helped me to break away from the conventional nineteenth-century Western presentation of History as a play in three acts—'Ancient, Medieval, and Modern'—by showing me that the history of 'Greece and Rome' was a unity, and that this unity was a whole that was complete in itself with its own Dark Age, Middle Age, and Modern Age. This unitary view of Greek and Roman history, which Eduard Meyer had given me, led me to look for a unitary name to describe the society whose history this was. I labelled it 'the Hellenic Civilization', and, when once I had identified one civilization, twenty other societies of the same species came into focus, one after another, in my field of historical vision.

Polybius, in his *Oecumenical History*, Book I, chapter 4, gave me my marching orders in his dicta that 'the coincidence by which all the transactions of the World have been oriented in a single direction and guided towards a single goal is the extraordinary characteristic of the present age'; 'the unity of events imposes upon the historian a similar unity of composition'; 'the study of general contacts and relations and of general resemblances and differences is the only avenue to a general perspective, without which neither profit nor pleasure can be extracted from historical research'.

The Western general war of A.D. 1914-18 ('World War One') opened my eyes to the historical and at the same time philosophic truth that my world in my generation was entering upon experiences which Thucydides, in his world in his generation, had already registered and recorded.

When, as a child, I used to come home from Kensington Gardens on winter evenings, after dark, across the bridge leading from Westbourne Terrace to Upper Westbourne Terrace over the Great Western Railway, a palaeotechnic arc light was mounted on a tall standard, overlooking the bridge, to illuminate the marshalling yard below; and, as I passed by, I used to be fascinated by the blue flame flickering between the two black carbon points. Long afterwards, when I was ruminating on the mysterious process through which spiritual illumination arises out of schism in the Soul and in Society, a vivid memory of my early visual impression of the arc light came to the aid of my imagination.

Eduard Meyer, in his masterly picture of the Achaemenian Empire,² revealed to me the specific historical function of a universal state. By

¹ In his *Kleine Schriften* (Halle 1910, Niemeyer), pp. 231-2.

² Meyer, E.: *Geschichte des Altertums*, vol. iii (Stuttgart 1901, Cotta), Erstes Buch: 'Der Orient unter der Herrschaft der Perser', pp. 1-233.

liquidating a host of idolized parochial states without succeeding in inspiring the same degree of devotion to itself, a universal state liberates, for conversion to the worship of God, psychic energy that has previously been concentrated on mutually conflicting idolatrous worships of Man's Collective Self.

Alfred von Kremer, by revealing to me in his *Culturgeschichte des Orients unter den Chalifen*¹ the morphological resemblance of the Caliphate to the Achaemenian Empire, led me to see in the Caliphate a 'reintegration' or 'resumption' or 'avatar' of the original Syriac universal state after a millennium during which the normal course of the disintegration-process in the life of a broken-down civilization had been interrupted in the Syriac World by the forcible intrusion of Hellenism into the Syriac Society's domain.

J. B. Bury, in *A History of the Later Roman Empire from Arcadius to Irene*,² which I found and read in Moberly Library at Winchester, not only revealed to me the existence of the Orthodox Christian Civilization, but showed me the spectacle of one civilization changing into another under the lens of the historian's magnifying glass. In the autumn of A.D. 1912 I had the happiness of coming to know the great historian personally.

Lord Bryce, in *The Holy Roman Empire*, not only revealed to me the Dark Ages and the Middle Ages of Western history, but also gave me my first insight into the process by which time-honoured institutions can acquire a new purpose and new significance without any ostensible breach in the continuity of their history. In A.D. 1915 I had the happiness of coming to know personally this great scholar-traveller-statesman—a patriarch whose perennial zest had made him immune against the doom of Tithonus—thanks to my good fortune in having been given a piece of work to do under his direction.

A. H. Lybyer, in *The Government of the Ottoman Empire in the Time of Suleiman the Magnificent*,³ revealed to me the blue-print of Plato's ideal commonwealth translated into real life in the Ottoman Pādīshāh's Slave-Household, and this revelation taught me what could and could not be achieved by handling human beings as if they were domesticated animals. I first heard of Lybyer's work from D. G. Hogarth, before meeting Lybyer himself, and working with him, in Paris during the Peace Conference of A.D. 1919-20.

General J. C. Smuts, in his *Holism and Evolution*,⁴ communicated to me his insight into the cosmic movement in which Reality passes through different orders of being without losing its continuity or its identity.

⁴ Second edition: London 1927, Macmillan.

The orders differ, but the genius of Creation and the goal towards which its course is set are the same at each and every level of the rising hierarchy of successive creatures.

The more southerly of the two round barrows on Slingsby Moor, on which I used often to lie on summer afternoons in the nineteen-thirties while I was writing Parts I-V of this Study, served as a physical receiving station for catching still unspent reverberations of waves of psychic events that had been breaking upon this fringe of the *Oikoumenē* since the unrecorded time at which this barrow had been heaped over the ashes of the unknown man whose presence was still brooding here in my day. When my dog Tilda and I were lying side by side on the barrow's pelt of heather, she used to prick up her woolly ears as she heard the rabbits stirring beneath us in their burrows, while my own sixth sense used to tingle with the inaudible music of 'the horns of elfland faintly blowing'.

Heine's *Reisebilder* and Goethe's *Faust*, which I read at Winchester, opened up two new worlds to me. The *Reisebilder* gave me an inside view of Napoleon's Empire; *Faust* gave me an insight into the good of Evil. I have been perpetually grateful to E. J. Turner ('the Hopper') for introducing me to these German works of Western literary art with an enthusiasm for them that was infectious because it was the offspring of understanding.

The Gospels and Herodotus made me aware of the divine irony in human affairs: the most tremendous of all the lessons of History.

Aeschylus anticipated my experience of Life in teaching me, while I was still at school, that learning comes through suffering, and that this is a law that has been ordained for us by God. Though I had not yet tasted the cup for myself, the truth of his words—

τὸν πάθει μάθος
θέντα κυρίως ἔχουσιν¹

—was warranted for me by their beauty.

The Authorized Version of the Bible, made in the reign of King James I, gives me, whenever I read it or hear it being read, an intimation of the divine presence informing our fragment of a mysterious Universe. The effect of a diction that is archaic yet at the same time familiar is more like that of music than like that of ordinary speech. It pierces through the Intellect and plays directly upon the Heart.

Paradise Lost, when I discovered it and devoured it in three days before I was eight years old, instilled into my mind, without my understanding it, my first idea of a theodicy.

¹ Aeschylus: *Agamemnon*, ll. 177-8.

Ibn Khaldūn, in his *Muqḡadamāt* (the Introduction to his *Universal History*), gave me a vision of a study of History bursting the bounds of This World and breaking through into an Other World.

Saint Augustine, in his *De Civitate Dei*, gave me a vision of the relation in which those two worlds stand to one another.

Henri Bergson, in *Les Deux Sources de la Morale et de la Religion*,¹ taught me that the ideal of the brotherhood of Mankind presupposes a belief in the fatherhood of God.

Fra Angelico's picture² of the angels and the souls of the elect, marshalled *πρασιναι πρασιναι* and adoring Christ in His glory, gave me a visual image of the Communion of Saints.

VIII

To People and Institutions, for showing Kindness to me

'Let us now praise famous men, and our fathers that begat us'.³ William of Wykeham gave me my education; and he had made this provision for me 507 years before I was elected a scholar of his College of Saint Mary de Winton prope Winton. Here was a man who had served God by making himself a minister of God's providence. *Fui et ego puer Wiccami*, and, like other sons of his, I feel towards our Founder a direct personal gratitude and affection which could not, I believe, have been warmer if I had known him in the flesh, instead of being born, as I was, 485 years after his death. 'The souls of the righteous are in the hand of God',⁴ and Time has no power to put distance between them and their adopted children.

M. J. Rendall revealed to me the beauty of the English poetry that he used to set to us for translation into Greek and Latin verse, and the beauty of the Italian pictures that he used to show to us in magic lantern lectures out of school. 'By strenuous intellectual communion and intimate personal intercourse' he communicated his love of beauty to us 'like a light caught from a leaping flame'.⁵ But his greatest revelation of beauty was one that was unintentional and unconscious. As we sat at his feet, we learnt what it meant to find ourselves in the presence of an *ἀνὴρ μεγαλόψυχος*.

'And some there be that have no memorial'⁶ in any of those pedestrian achievements that are the slow work of Time and are therefore at the mercy of all the chances and changes of this mortal life. The play of Chance that, by the 23rd September, 1952, had prolonged the life of the writer of this Study into its sixty-fourth year⁷ had cut short the

⁷ By leading him on the 26th April, 1912—on faith in a sheet (lying at his elbow at this moment) of the Austro-Hungarian staff map of Greece which showed a carriage-

lives of contemporaries and friends of his who had been killed in battle some thirty-eight years earlier; and, at the moment of completing a work of his own that had taken more than thirty years to carry out, he could not be unmindful of the unwritten works lost to the World through the heroic untimely deaths in action of Guy Leonard Cheesman, Leslie Whitaker Hunter, Alexander Douglas Gillespie, Robert Hamilton Hutchison, Arthur Innes Adam, Wilfrid Max Langdon, Philip Anthony Brown, Arthur George Heath, Robert Gibson, and John Brown—ten representatives of the innumerable brave and self-sacrificing young men—of whom the World was not worthy¹—whose lives had been cut short in the wars that had been waged since the beginning of the Age of the Civilizations. These scholars who gave their lives as soldiers in their early manhood in the First World War lived on in the hearts and minds of their surviving friends, and the life and work of one of these survivors owed more than he could say to his perpetual memory of these prematurely dead companions.

The Council on Foreign Relations in New York held in safe keeping for me, from before Munich week until after VJ-Day, my notes for Parts VI–XIII of this book and the notebooks in which I had put down the gist of my reading during the previous twenty years. This act of kindness gave me many times over during the Second World War the consolation of feeling *non omnis moriar*.²

Dr. Sylvia Payne helped me, in a time of great personal trouble, to find a way through the dark wood which I could not have found by myself—

E quanto a dir qual era è cosa dura
Questa selva selvaggia ed aspra e forte,
che nel pensier rinnuova la paura.

The Rockefeller Foundation of New York made it possible for me, after an eight-years-long interruption, to write the first draft of Parts VI–XIII of this book within the four years beginning on the 1st July, 1947, and to send these four volumes to press in the second half of the year 1952, by providing the Royal Institute of International Affairs in London with the financial means for releasing a substantial part of my time by reinforcing the staff of the department producing their *Survey of International Affairs*, which had had to be taken up again, after the war, with eight years (and these no ordinary years) of arrears to make good. More than this, the Foundation made it financially possible for my wife and me to accept invitations from the Institute for Advanced Study at Princeton to pay periodical visits there which have been invaluable to us for making progress in our work.

road along a stretch where there proved not even to be a goat-track—to miscalculate the number of hours' walking distance between Káto Vezáni and Yýthion, and consequently to exhaust the contents of his water-bottle and replenish it from a stream which proved to be infected with germs of dysentery. ('That is very bad water', as a cottager correctly said, after he had silently watched the unwarned traveller drink his fill of it.) This accident incapacitated the writer for military service in the War of A.D. 1914–18.

¹ Hebrews xi. 38.

² Horace: *Carmina*, Book III, Ode xxx, l. 6.

If the Rockefeller Foundation, the Royal Institute of International Affairs, and the Institute for Advanced Study at Princeton had not all co-operated with one another to help me in these most imaginative, considerate, and effective ways, I should not have been able to finish the book by this time, and I might never have managed even to make a fresh start with the writing of it.

Sidney Marsh showed himself a friend in need by helping me on my way when I was passing through a time of troubles. His kindness was touching, because it came from the heart; but it was hardly surprising, because it was characteristic. The loggia at Ardens, opening southwards over Ashdown Forest towards the Downs, was a place where I found myself able, after an eight-years-long interruption in the writing of this book, to recover my resolution and to recollect my thoughts when I was setting myself to take my half-finished enterprise up again and to carry it through to its conclusion.

Professor Roland G. Kent and Professor George G. Cameron generously spent much time and trouble on helping me to correct some of the more glaring faults—ranging from errors of judgement, through mis-statements of fact, to mistakes in spelling—in an amateur essay on the administrative geography of the Achaemenian Empire.¹ These two eminent scholars are not, of course, implicated, by my declaration of my gratitude for their help, in any of those faults that have not been eliminated. Professor Kent's invaluable comments on the first draft of my essay must have been one of the last of the many such characteristic acts of kindness that he was able to do before his death on the 27th June, 1952.

Mr. Martin Wight gave up the best part of a much-needed summer holiday to working through the first draft of Part VII of this Study and writing out for me his considered comments and criticisms. I have shown my high appreciation of these by incorporating them *in extenso* in footnotes and appendixes. The effect has been to turn my original monologue into a dialogue which should be decidedly more interesting and valuable to the reader. Mr. Wight has made it clear, apropos of my references to Christianity, what the unabrogated traditional Christian positions are, and the points in which my personal standpoint differs from them. He has drawn attention to the abiding Judaic vein of exclusiveness and intolerance in Christianity, and he has correctly convicted me, on this crucial issue, of holding with Symmachus as against Saint Ambrose, with Mangū as against William of Rubruck,² and with Radhakrishnan as against Karl Adam, Jean Daniélou, and Hendrik Kraemer.

¹ VI. vii. 580–689.

² 'Even as God has given several fingers to the hand, so has He given Man several ways.'—The Mongol Khāqān Mangū in his conversation, on Whitsunday A.D. 1254, with the Franciscan Friar William of Rubruck, as reported by Friar William in *Itinerarium Fratris Willielmi de Rubruquis, de Ordine Fratrum Minorum, Galli, Anno Gratie 1253 ad Partes Orientales*, chap. 51 (see V. v. 114–15 and VI. vii. 106).

Mr. Thomas Wallas, of the London and Lancashire Insurance Company, has most kindly communicated to me authoritative information about the statistical material that was accessible to the earliest insurance companies in Great Britain at the time when they first went into business.

Mr. James Laver, Keeper of the Departments of Engraving, Illustration and Design and of Paintings, at the Victoria and Albert Museum in London; the Rev. Father P. Benedetto Renzi, Rector of the Church of San Francesco at Arezzo; and Signor Pietro Zampetti, Soprintendente alle Gallerie delle Marche, have all given me most kind help in my inquiries into the affinities of certain forms of headgear.

Dr. Sidney Smith, Professor Albrecht Goetze, Professor F. W. Albright, Mr. M. B. Rowton, and Mr. D. J. Wiseman have most kindly come to my aid over my amateur essay on the chronology of South-West Asian history during the first half of the second millennium B.C.¹ It might be no disgrace for an amateur to come to grief in a field in which the professionals agree only in frankly declaring that their own divers reconstructions can be no more than tentative in the present inconclusive state of the evidence. Our knowledge of early South-West Asian history through the progress of archaeological excavation is increasing so fast that this present chronological puzzle may be solved any day—perhaps before this volume is published—by some decisive new discovery. Meanwhile, the essay which the five scholars to whom I am now declaring my gratitude have helped me to revise may serve the reader as an interim report on the main alternative possible reconstructions of this passage of history in the light of the evidence as it stands today (the 24th September, 1952).

I am particularly grateful to Mr. Rowton for the great trouble that he has taken to pilot me through the maze with his steady hand.

My sisters, Professor J. M. C. Toynbee and Miss M. R. Toynbee, have shown their kindness by tolerating my queries, and their learning by never failing to tell me the answers to them.

The librarian of the Royal Institute of International Affairs in London, Miss Barbara Kyle, and the librarian of the Institute for Advanced Study at Princeton, Miss Judith Sachs, with all their colleagues, have helped me on my way at every stage of a long literary journey by their inexhaustible obligingness and resourcefulness in meeting a formidable flow of queries, besides requests to procure for me the loan of books dealing with a great variety of subjects.

Miss Elizabeth Horton of the Institute for Advanced Study at Princeton has made it possible for me, by her kindness to me on repeated visits, to enjoy the full benefit of the rare facilities that the Institute offers to scholars. In January 1951, when the international situation looked so

¹ Printed in this volume on pp. 167-212, above.

grave that it seemed folly to carry the unique text of a still untyped manuscript back with me to Europe, Miss Horton and her colleague Miss Farr generously gave me ease of mind by undertaking to type for me the manuscript that I had written at Princeton during the preceding three months.

Miss J. K. Galbraith has checked, with Miss Reddin, the whole of the typescript against the manuscript. Her generous help has made it possible to do something that could not have been done without the co-operation of two minds and two pairs of eyes. The process has been as exacting and laborious as it has been indispensable for securing the accurate reproduction of the text. To cope with such outlandish pieces as, for example, the Annex on the Administrative organization of the Achaemenian Empire has been not merely a kind act but an angelic one.

Miss Bridget Reddin has done the typing, from beginning to end, of a complicated manuscript in crabbed handwriting, infested with footnotes and festooned with annexes. Her patience, care, accuracy, perseverance, and friendship have carried all ten volumes of this book on their passage from the writer's hands to the printer's across a gulf as broad as the Atlantic.

One of the red-letter days in my life is a day in 1933 on which, after I had ventured, with my heart in my mouth, to submit the typescript of volumes i-iii of this Study to Sir Humphrey Milford, I received from him a characteristically laconic note saying: 'I will take your big book'. Since that date, I have been continuing to receive the kind and skilled help of all concerned at Amen House, at 114 Fifth Avenue, and at Oxford in the heavy and exacting task of printing and publishing a work on this scale. Five times within twenty years, I have unloaded on them a suitcase full of copy; and the aggregate weight of these five loads must have been large. At every stage in the long process of production, these friends and collaborators on the technical side of the undertaking have given me innumerable occasions for looking back with gratitude to a decision of Sir Humphrey Milford's which has meant so much to me, first under his auspices and then under Mr. Geoffrey Cumberlege's at Warwick Square and under Mr. H. Z. Walck's on the other side of the Atlantic.

Mr. John Lodge—Headmaster *emeritus* of Nantwich and Acton Grammar School—has read the proofs of volumes vii-x in galley and, besides making a number of suggestions which have been gratefully adopted by the author, and detecting a number of errors that had escaped both the author's and the printer's eye, he has generously taken off the author's shoulders the laborious but indispensable task of verifying cross-references between passages in this Study and references to the Bible, to the Greek and Latin Classics, to works of Western literature in English and other vernaculars, and to other books that are on the shelves of Mr. Lodge's library. Help so kind, disinterested, timely, and effective as this is a gift that touches the heart. I lament my friend's sudden death on the 1st April, 1954.

Professor E. D. Myers, the head of the Department of Philosophy in Washington and Lee University, Lexington, Virginia, has compiled the gazetteer of geographical names, covering all ten volumes of this book, which will be issued as a supplementary volume, and has planned and drawn—in a form in which Mrs. Gomme could put them into shape for the Oxford University Press—many of the maps, illustrating all ten volumes, which will also appear in volume xi. The gazetteer illuminates passages in the book in which the geographical setting of the narrative may be unfamiliar to some Western readers, while the maps make it possible for a reader to acquaint himself at a glance with geographical facts which would have required many pages of uninviting letterpress if the author had tried to describe the same facts in words. In thus coming to the reader's rescue, Professor Myers has given a pleasure to the author as well; for it has been pleasant indeed for him to have the chance of working in partnership with an old friend who knows the contents and structure of his book, understands its purpose, and has had the skill and kindness to interpret the book to the public—as, for instance, in the chart reproduced in vol. xi.

The Royal Institute of International Affairs—on whose staff I have had the happiness of serving for almost thirty years (and my wife for still longer)—has given me a profession that has been an education and a fellowship that has been a stimulus. In the course of producing, for the Institute, a *Survey of International Affairs* from the morrow of the peace-settlement of 1919–21 to the morrow of the Second World War, I have been continually educated in the study and the writing of History; and, in doing this work at Chatham House, I have had the immense advantage of finding myself in the society of men and women—on the Council, among the members, and among my colleagues on the staff—who have had a varied experience of practical affairs in responsible positions in many walks of life. I am grateful, above all, for the particularly favourable conditions under which the authorities of Chatham House have always allowed me to do my work. While the production of the *Survey* has been a valuable discipline, because it has been an exacting task (even with the wonderful assistance that I have had), I have been left free to be my own master in the use of my time, and have been given a generous margin of leisure for the writing of the present *Study* under Chatham House's auspices. Both works have, I believe, benefited greatly by being carried on simultaneously for a quarter of a century.

Chatham House means, for me, a host of friends. I cannot name them all, but I cannot leave unnamed my colleagues Ivison Macadam and Margaret Cleeve or my master and mentor Sir James Headlam-Morley, who taught me how to launch our *Survey*. I never forget the generosity with which he gave his time and thought and encouragement in helping a younger historian; and I also never forget the great history of the antecedents of the First World War which Headlam-Morley would have given to the World if his life had not been cut short.

My wife, for the third time, has made the magnificent index without which no batch of volumes of this *Study* would be complete. These

three indexes, which are the keys to vols. i-iii, iv-vi, and vii-x, are labours that have been none the less strenuous for having been labours of love. These indexes have been hard to make because they are no mere catalogues of names and facts, but are masterly analyses of the ideas propounded in the book; and this analytical exposition, which has been such an exacting intellectual task for the indexer, will have been found proportionately valuable by the reader. As for the author, each time that he has read, in draft, one of these indexes to a batch of his volumes, he has been given a fortifying sense of assurance that, after all, his book cannot be altogether nonsense, since some sense seems to have been made of it bona fide by a mind whose critical power is as well known to him as its charity. Yet this is only one of the innumerable things that his wife has done for him.

There are people—some of them mentioned already—to whom I owe so much and with whom I have been so intimate that I cannot put into words the full measure of what they have given to me and can only express my feelings for them by here inscribing their initials—*tot pignora amoris*—in the alphabetical order of their first names, *videlicet*: B.H., B.H.S., C.C.-E., D.D., E.P.F., E.R.M., G.M., H.T.W.-G., J.A.S., J.D.D., J.L.H., M.F., R.M.Y.G., R.S.D., R.T., S.E.T., V.M.T.

INDEX¹

In the cross references in this index, references in small capitals (e.g. ARAB CALIPHATE at end of the heading 'Abbasid Caliphate') are to other main headings, while references in ordinary type are to subdivisions of the same main heading.

Abandon, viii. 47.

Abāqā, Il-Khān, x. 71.

Abarca, wife of Al-Mansūr, viii. 372 n.

'Abbās I, grandson of Mehmed 'Alī, viii. 602.

'Abbasid Caliphate, of Baghdad: as Syriac universal state, vii. 12, 53, 159; ix. 15, 695; x. 67; break-up of, ix. 104; Buwayhids, relations with, vii. 14; viii. 359; capital of, vii. 208, 209; centre of gravity of, x. 67; civil service, vii. 152, 346; cohesive force of, vii. 24; communications, system of, vii. 82-84, 98-99, 100, 209; culture of, vii. 159; ix. 83; — Hellenic influence on, vii. 408 and n., 409 n., 475, 518, 586, 670; decline of, vii. 12, 13-14, 316, 346; viii. 359, 365, 393; dominant minority, viii. 365; egalitarianism of régime, vii. 151-2; ix. 325; establishment of, vii. 146, 148, 149, 151, 209, 377; viii. 70, 361, 365; ix. 325-6; financial system of, vii. 84, 151; frontiers, defence of, vii. 150 n.; geographical range of, viii. 409 n.; x. 67; Herodianism of, viii. 586; interregnum follow-

ing, viii. 362, 365, 368; ix. 95; Iranians, influence of, vii. 150-1, 704; Islam, attitude towards, viii. 361, 365; Khurāsānis, relations with, vii. 148-52, 157 n., 329; viii. 361, 365; law, system of, vii. 151, 159; legitimization of alien conquerors by, vii. 12-16, 21; marches of, ix. 39; military system of, vii. 150, 157 n., 339; Mongols, relations with, vii. 399; — see also under BAGHDAD; 'New Era', vii. 150 and n., 151; nomad origin, ultimate, of, viii. 664; nomads, relations with—Arab, vii. 209; — Eurasian, vii. 261 n., 329; ix. 36; x. 199; non-Muslim subjects, relations with, viii. 365-7; overthrow of, vii. 11-12, 14, 20, 74, 98-99, 149 n., 150, 158, 159, 160, 229, 331, 339, 378; viii. 49, 70, 93, 108 n., 355, 359, 361, 727; ix. 36, 119, 695; x. 67-68, 69, 70, 71, 74 n., 84, 88, 116; postal service of, vii. 83-84; provinces, organization of, vii. 180; Saljūqs, relations with, vii. 329; viii. 359, 365, 371; ix. 36; successor-states of, vii. 150 and n., 151 n., 160, 258 n., 399, 704; viii. 70, 96, 121, 352, 354, 359, 368; x.

¹ This index includes only those place-names that are of importance as subject-headings. A full list of all place-names mentioned in volumes i-x is being published in vol. xi (Maps and Gazetteer). Many of the battles entered in this index have been given their dates, but the dates of the lives or reigns of individuals and of the durations of states have not been entered. Notices, in the text, of the dates of reigns have, however, been indexed, and the durations of universal states, with their antecedent Times of Troubles, though not the durations of other states, will be found in vii. 769, Table I. If ever a consolidated index of vols. i-x is made, a systematic insertion of dates might be an addition that would be useful to the reader.

The compilation of an index draws attention to variations in the spelling of names. Some of these variations have been deliberate. For instance, while Greek names of people living in 'the Hellenic Age' (circa 1125 B.C. — A.D. 675) have been spelled in these volumes in the Latin travesty of them which is familiar, because conventional, in English and other Western languages, Greek names of people living in 'the Orthodox Christian Age' (i.e. since circa A.D. 675) have been spelled in a romanization of the original Greek spelling as this has been pronounced and accented by speakers of the Greek language in this age. This has been done in order to make the reader's eye constantly remind him that the Byzantines are neither belated Hellenes nor eccentric Franks, but are members of a distinct society of the same species as both the Western and the Hellenic. Again, the vowels in Turkish names have been differentiated from those in Arabic names in order to take account of the vowel harmonies that are a characteristic feature of the Turkish family of languages; and, in Ottoman Turkish names that include the equivalent of the Arabic name Muhammad, account has been taken of the Ottoman Turkish pronunciation by spelling the name as Mehmed. On the other hand, variations in the spelling of Teutonic barbarian names are due to the vagaries of Modern Western scholars, and variations in the spelling of Chinese names to the writer's own ignorance. If he and his wife live to produce a consolidated index for a standardized new edition of vols. i-x, he will ask authorities on the Chinese language to come to his help by standardizing the spelling of all Chinese names consistently in one or other of the current competing systems of romanization.

Even so, in a book in which the names mentioned are taken from a considerable number of different languages, originally conveyed in different scripts, complete consistency could hardly be attained without abandoning the Latin Alphabet and substituting for it some system of phonetic symbols, and few readers would welcome consistency at this price.

- 68 n., 70, 73; tolerant spirit of, viii. 365; totalitarian character of, viii. 57-58; *see also* ARAB CALIPHATE.
- *Abbasid Caliphate, of Cairo: as ghost of Baghdad Caliphate, vii. 19, 20 *seqq.*; ix. 15, 17, 38, 119, 153, 165, 197; as puppet of Mamlûks, ix. 103, 165, 695; educational policy of, vii. 362 n.; establishment of, vii. 20 and n., 21, 26 n.; viii. 359; ix. 695; extinction of, vii. 20, 22, 26 n.; viii. 49; ix. 695; legitimization of alien rulers by, vii. 21-22; Ottoman Empire, relations with, vii. 21; *raison d'être* of, ix. 119.
